Important Notices and Disclaimers: Publication of this handbook is for the purpose of circulating information and opinion among those concerned for fire and electrical safety and related subjects. While every effort has been made to achieve a work of high quality, neither the NFPA® nor the contributors to this handbook guarantee or warrant the accuracy or completeness of or assume any liability in connection with the information and opinions contained in this handbook. The NFPA and the contributors shall in no event be liable for any personal injury, property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this handbook.

This handbook is published with the understanding that the NFPA and the contributors to this handbook are supplying information and opinion but are not attempting to render engineering or other professional services. If such services are required, the assistance of an appropriate professional should be sought.

NFPA 70®, *National Electrical Code®* (“*NFPA 70*”), is, like all NFPA codes, standards, recommended practices, and guides (“NFPA Standards”), made available for use subject to Important Notices and Legal Disclaimers, which appear at the end of this handbook and can also be viewed at www.nfpa.org/disclaimers.

Notice Concerning Code Interpretations: This fourteenth edition of the *National Electrical Code® Handbook* is based on the 2017 edition of *NFPA 70*. All NFPA codes, standards, recommended practices, and guides (“NFPA Standards”) are developed in accordance with the published procedures of the NFPA by technical committees comprised of volunteers drawn from a broad array of relevant interests. The handbook contains the complete text of *NFPA 70* and any applicable Formal Interpretations issued by the NFPA at the time of publication. This NFPA Standard is accompanied by explanatory commentary and other supplementary materials.

The commentary and supplementary materials in this handbook are not a part of the NFPA Standard and do not constitute Formal Interpretations of the NFPA (which can be obtained only through requests processed by the responsible technical committees in accordance with the published procedures of the NFPA). The commentary and supplementary materials, therefore, solely reflect the personal opinions of the editor or other contributors and do not necessarily represent the official position of the NFPA or its technical committees.

REMINDER: UPDATING OF NFPA STANDARDS

NFPA 70, *National Electrical Code*, like all NFPA codes, standards, recommended practices, and guides (“NFPA Standards”), may be amended from time to time through the issuance of Tentative Interim Amendments or corrected by Errata. An official NFPA Standard at any point in time consists of the current edition of the document together with any Tentative Interim Amendment and any Errata then in effect. In order to determine whether an NFPA Standard has been amended through the issuance of Tentative Interim Amendments or corrected by Errata, visit the “Codes & Standards” section on NFPA’s website. There, the document information pages located at the “List of NFPA Codes & Standards” provide up-to-date, document-specific information including any issued Tentative Interim Amendments and Errata. To view the document information page for a specific NFPA Standard, go to <http://www.nfpa.org/docinfo> to choose from the list of NFPA Standards or use the search feature to select the NFPA Standard number (e.g., *NFPA 70*). The document information page includes postings of all existing Tentative Interim Amendments and Errata. It also includes the option to register for an “Alert” feature to receive an automatic email notification when new updates and other information are posted regarding the document.

Dedication

This edition of the *National Electrical Code® Handbook* is dedicated to Michael J. Johnston for his outstanding leadership during both the 2014 and 2017 revision cycles of the *NEC®*. While Mike continues as chair of the NEC Correlating Committee through the 2020 edition of the *NEC*, his leadership has been so exceptional that we chose to honor him before the end of his tenure. He is a true leader, with unwavering dedication to the mission and the people who make it all happen.

The 2017 *NEC* revision cycle brought extraordinary changes to how the work gets done. Mike's exemplary organizational and communication skills ensured that our panel members and correlating committee members were well prepared to embrace the changes and complete their all-important

work of revising the *NEC*. Mike was ahead of the curve by being a strong advocate for training on the new process and for the use of task groups to help the committees work more efficiently, including mock meetings with monitored replays online, which enabled participants to get their questions answered.

Mike is the executive director of standards and safety at the National Electrical Contractors Association (NECA), where he has been for eight years. He previously served as director of education codes and standards for the International Association of Electrical Inspectors (IAEI) for ten years. His diverse electrical background and his work with NECA and IAEI have empowered Mike to effectively communicate across many industry segments. As a result, his educational programs have long been recognized as being among some the best in the field. His dedication to training and the electrical industry has resulted in numerous recognitions, including the Artie's Apple Award from the Southwestern Section of IAEI, as well as the prestigious Gold Road Runner pin for his long-standing dedication to *NEC* education through IAEI.

Mike has authored a number of books at NECA and IAEI, including *Significant Changes to the 2011 and 2014 NEC* and several editions of the *Analysis of Changes to the National Electrical Code*. He has also worked on the Electrical Training Alliance's *Applied Grounding & Bonding* and *Soares Book on Grounding and Bonding*. During his time at NECA, numerous new standards have been added to the National Electrical Installation Standards (NEIS) library. Mike is an active member of ANSI, IAEI, NFPA, SES, ASSE, ANSI-EVSP, ANSI-EXSC, the UL Electrical Council, and the National Safety Council. He is the vice-chair of the NFPA Electrical Section and also served as chair of *NEC* Code-Making Panel 5 for the 2011 cycle. Mike has also served as an electrical inspector, an inspection field supervisor, a journeyman, and a master electrician.

It is often said that great leaders lead by example and recognize that they cannot do the job alone. Mike has been a master at selecting the right leaders and delegating responsibilities for training activities, ongoing technical issues needing resolution, and new technical areas, many of which have resulted in significant additions in the 2014 and 2017 editions of the *NEC*. Under Mike's leadership, the changes in the revision process have been effected and, more importantly, the *NEC* has been positioned to keep pace with today's dynamic electrical industry. The editors wish to thank Mike for his leadership and untiring dedication to the *NEC* and for all the help he has provided to us. It is with extreme pleasure that we proudly dedicate this, the 2017 edition of the *National Electrical Code Handbook*, to Michael J. Johnston.

PDF Navigation Tips

Find

To find a word or term in the PDF:

1. Select Find under the Edit menu or use the keyboard shortcut: CTRL + F for PC; COMMAND + F for Mac.
2. Type a word or term in the Find box. To specify Whole words only or Case-sensitive, use the drop-down arrow to the right of the Find box and toggle these criteria on or off.

The found term will be highlighted in the text. To go to other occurrences of the term, use the previous and next buttons that appear beside the Find box.

Advanced Search

Use the drop-down arrow to the right of the Find box and select Open Full Search. Additional search options are available by selecting Show More Options at the bottom of the pane. Options in the advanced search window include matching the exact word or phrase, matching only some of the words, and stemming (see below).

Stemming finds words that contain part (the stem) of a specified search word. For example, a search for the word *opening* would find instances of *open*, *opened*, *opens*, and *openly*. Wildcard characters (* or ?) are not permitted in stemming searches. Stemming isn't available if either Whole words only or Case-sensitive is selected.

Links

Links to other sections of the document are colored red. When you click on a link and are directed to another page, use the following keyboard shortcut to return to the original page: ALT + <left arrow> for PC; COMMAND + <left arrow> for Mac.

Preface

This handbook contains the 54th edition of the *National Electrical Code*[®]. Nearly 120 years have passed since those cold days in March of 1896 (a mere 17 years after the invention of the incandescent light bulb), when a group representing a variety of organizations met at the headquarters of the American Society of Mechanical Engineers in New York City to develop a national code of rules for electrical construction and operation. This was not the first attempt to establish consistent rules for electrical installations, but it was the first national effort. The need for standardization was becoming urgent; the number of electrical fires was increasing. By 1881, one insurer had reported electrical fires in 23 of the 65 insured textile mills in New England.

The major problem was the lack of an authoritative, nationwide electrical installation standard. As one of the early participants noted, “We were without standards and inspectors, while manufacturers were without experience and knowledge of real installation needs. The workmen frequently created the standards as they worked, and rarely did two men think and work alike.” By 1895, five electrical installation codes were in use in the United States. The manufacture of products that met the requirements of all five codes was difficult, so something had to be done to develop a single national code. The committee that met in 1896 recognized that the five existing codes should be used collectively as the basis for the new code. In the first known instance of international harmonization, the group also referred to the German code, the code of the British Board of Trade, and the Phoenix Rules of England. The importance of industry consensus was immediately recognized; before the committee met again in 1897, the new code was reviewed by 1200 individuals in the United States and Europe. Shortly thereafter, the first standardized U.S. electrical code, the *National Electrical Code*, was published.

The *National Electrical Code* has become the most widely adopted code in the United States. It is the installation code used in all 50 states and all U.S. territories and is now used in numerous other countries. Use of the *Code* continues to grow because it is a living document, constantly changing to reflect changes in technology. And it continues to offer an open-consensus process. Anyone can submit a proposal for change or a public comment, and all proposals and comments are subject to a rigorous public review process. The *NEC* provides the best technical information, ensuring the practical safeguarding of persons and property from the hazards arising from the use of electricity.

Throughout its history, the National Electrical Code Committee has been guided by giants in the electrical industry — too many to mention individually. The first chairman, William J. Hammer, provided the leadership necessary to get the *Code* started. More recently, the *Code* has been chaired by outstanding leaders such as Richard L. Loyd, Richard W. Osborne, Richard G. Biermann, D. Harold Ware, James W. Carpenter, and Michael J. Johnston. Each of these men has devoted many years to the National Electrical Code Committee.

Acknowledgments

Building on our experience from the 2014 edition, this edition of this handbook has been more of a team effort than any previous edition. We got an early start so that we could give this book the most thorough review it has ever had. The team met frequently to discuss and debate the merits of the commentary, and we rewrote much of it in those meetings. A critical goal was to reduce “code speak” to make the book more readable. As a result, we hope you find this book easier to understand and more helpful. These meetings also engendered some great ideas for future editions. Although the word “synergy” may be overused, the editors wish to thank Debra Rose and Ken Ritchie for all they did to create the synergy of this team. Special thanks to Debra, the project manager, who kept this project on track and handled all the important logistical details.

The editors would like to express thanks to Cheryl Langway and Josiane Domenici for their contributions to the design and artwork and for obtaining the necessary permissions. Without the efforts of Debra, Ken, Cheryl, and Josiane, this new and improved edition of the *NEC Handbook* would not have been possible. We also gratefully acknowledge the fine work of Cara Grady, whose attention to detail helps us to make those editorial changes that make us all look good. The editors also wish to thank Jeff Sargent and Tim McClintock for their work on the list of Technical Changes for the 2017 *NEC*.

One of the critical positions to the success of the *NEC* is the recording secretary/project administrator. We have been blessed to have had Kimberly Shea work with us on the last two editions of the code. We wish to thank her for her dedication. We also wish to thank the electrical support staff, Carol Henderson and Mary Warren, for their support of this project.

The editors express special appreciation to the International Association of Electrical Inspectors and IAEI CEO/Executive Director David Clements for their contribution of a significant number of outstanding photographs for this edition of the handbook. We have conferred closely with members of the National Electrical Code Committee in developing the revisions incorporated into the 2017 edition of the *Code*. The assistance and cooperation of code-making panel chairs and various committee members are gratefully acknowledged.

The editors wish to note the passing of several current and former committee members and friends, including Richard Biermann, Len Sessler, Paul Duks, Dick Murray, Joe Ross, Doug Pirkle, Nancy Loyd, Tom Thierheimer, Charlie Trout, Nelson Montgomery, John Minick, Dick Nalbert, Tim Andrea, Jeff DesJarles, Ron Kirby, Pam Cloutier, Michael Ber, Marion Kehoe, William Crist, Joe Pipkin, and Joel Rencsok. Dick Murray was an editor for three editions of this handbook. We are grateful for his contributions.

The editors also thank the manufacturers and their representatives who generously supplied photographs, drawings, and data upon request. Special thanks also to the editors of and contributors to past editions, especially Jeff Sargent, Joe Sheehan, and John Caloggero. Their work provided an excellent foundation on which to build.

Richard G. Biermann Award

The Richard G. Biermann Award was created this year to honor the memory of Richard G. Biermann, the former chair of the National Electrical Code Correlating Committee. His service on the *NEC* included serving as chair of Code-Making Panel 16 (CMP) and as a member of several other CMPs. Mr. Biermann also served NFPA as a member of the Standards Council and as a member of the Board of Directors. In 1995, he received the Paul C. Lamb Award in recognition of his outstanding service to NFPA.

This award honors outstanding volunteerism on task groups, code-making panels, the Correlating Committee, or promoting the adoption and application of the *NEC*. We are pleased to announce that Mr. John R. Kovacik has been selected as the first recipient.

John Kovacik is UL's Primary Designated Engineer (PDE) for industrial control equipment, components, and assemblies including control panels and industrial machinery. His primary responsibilities are driving consistency, integrity, and engineering quality in the establishment and application of UL product certification requirements.

John's 42-year career with UL includes many years of experience with codes and standards. He represents UL on a number of technical committees covering a broad range of subjects for NFPA, NEMA, and the IEC. This includes membership as UL's principal representative on the NFPA 20 Committee for Stationary Fire Pumps and the NFPA 79 Committee for Industrial Machinery. He serves as the Technical Advisor for the U.S. National Committee Technical Advisory Group for IEC/SC 121A.

John is UL's principal member on the National Electrical Code Correlating Committee. As UL's representative on this committee, he is responsible for coordinating UL's participation in *NEC* activities. He is also a member of *NEC* Code-Making Panels 12 and 13.

John is a Corporate Fellow of UL's William Henry Merrill Society, has received the IEC 1906 Award, the NFPA Committee Service Award, the NFPA Richard G. Biermann Award, and is an NFPA Life Member.

About the Editors

Mark W. Earley, P.E., is the chief electrical engineer at NFPA. He has served as secretary of the *NEC* since 1989, co-author of NFPA's reference book *Electrical Installations in Hazardous Locations*, and editor for the *NFPA 70E® Handbook for Electrical Safety in the Workplace*. Prior to joining NFPA, he worked as an electrical engineer at Factory Mutual Research Corporation (now FM Global). Additionally, he has served on several of NFPA's electrical committees and *NEC* code-making panels. Mr. Earley is a registered professional engineer (licensed in Rhode Island) and a member of the International Association of Electrical Inspectors (IAEI), the Institute of Electrical and Electronics Engineers (IEEE), the Society

of Fire Protection Engineers (SFPE), the Automatic Fire Alarm Association (AFAA), the UL Electrical Council, the U.S. National Committee of the International Electrotechnical Commission, and the Canadian Electrical Code, Part 1 Committee. He has also been the recipient of various awards in the electrical industry, including the distinguished service award from the U.S. National Committee of the International Electrotechnical Commission, the meritorious service award from the American National Standards Institute (ANSI), the award for outstanding service to the electrical industry from the National Electrical Contractors Association (NECA) and the International Brotherhood of Electrical Workers (IBEW), and the honorary Artie's Apple Award from the Southwestern Section of IAEI, in recognition of his dedication and exemplary efforts toward education.

Christopher D. Coache is a senior electrical engineer at NFPA. Prior to joining NFPA, he was employed as an electrical engineer and as a compliance engineer in the information technology industry. He has participated in the International Electrotechnical Commission (IEC), Underwriters Laboratories (UL), and the Instrument Society of America (ISA) standards development. Mr. Coache serves as the staff liaison for NFPA 73, *Standard for Electrical Inspections for Existing Dwellings*; NFPA 110, *Standard for Emergency and Standby Power Systems*; NFPA 111, *Standard on Stored Electrical Energy Emergency and Standby Systems*; NFPA 70B, *Recommended Practice for Electrical Equipment Maintenance*; and *NFPA 70E®, Standard for Electrical Safety in the Workplace®*.

He is also an editor of the *Handbook for Electrical Safety in the Workplace®* and the *National Fire Alarm and Signaling Code Handbook*. Mr. Coache is a member of IAEI and IEEE.

Mark Cloutier is a senior electrical engineer at NFPA, where he is part of the electrical staff that participates in the development of the *NEC* and the *NEC Handbook*. He also serves as staff liaison for NFPA 79, *Electrical Standard for Industrial Machinery*; NFPA 790, *Standard for Competency of Third-Party Field Evaluation Bodies*; and NFPA 791, *Recommended Practice and Procedures for Unlabeled Electrical Equipment Evaluation*. Mr. Cloutier has been involved in the electrical industry for over 30 years, working as an electrical engineer for the industrial consumer division of a major automatic test equipment company and as an electrical contractor and electrician. He holds electrician licenses in both Massachusetts and Maine,

a B.S. degree in electrical engineering from Southeastern Massachusetts University, and is a member of IEEE and IAEL. He also represents NFPA on several UL product standards as part of their standards development process.

Gil Moniz is a senior electrical specialist at NFPA. Prior to joining NFPA in 2013, he served as the Northeast Field Representative for the National Electrical Manufacturers Association (NEMA), an electrical inspector for the city of New Bedford, Massachusetts, a licensed master electrician in Massachusetts, and licensed journeyman in Massachusetts and Rhode Island. Mr. Moniz served as chair of Code-Making Panel 1 for the 2011 and 2014 *NEC* and as a principal member of Code-Making Panel 20 for the 2008 *NEC*. He also served on the 2008 and 2012 New York State Residential Code Technical Subcommittees, Massachusetts Electrical Code Advisory Committee, New York City Electrical Advisory Board, New York

City Electrical Code Revisions and Interpretations Committee, and as an advisor to the Rhode Island Electrical Code Subcommittee.

Derek Vigstol is the electrical technical lead for NFPA, where he serves as a technical resource for the development and implementation of new products in support of NFPA electrical codes and standards. He joined NFPA in 2015 as a senior electrical specialist, where he assisted in the codes and standards development process for multiple NFPA documents along with providing answers to technical questions from NFPA members. Prior to joining NFPA, Mr. Vigstol was an instructor at the Minneapolis Electrical JATC and a licensed Minnesota master and journeyman electrician. He has taught apprentice electrician students as well as provided continuing education classes for electrical license renewal in Minnesota.

In 2014, he became the inaugural *NEC* Challenge Champion by proving his knowledge of the *NEC* against competitors from across the country. Mr. Vigstol is also a member of IAEL.

Technical Changes

Editor's Note: This table provides an overview of major code changes from the 2014 to the 2017 edition of *NFPA 70®, National Electrical Code®*. Purely editorial and formatting changes are not included. For more information about the reason(s) for each change, visit www.nfpa.org/70. The first revision (FR), second revision (SR), and second correlating revision (SCR) numbers are given in the third column of this table for reference to the official documentation of the technical committee's actions.

Section	Comments	FR/SR/SCR Reference
Article 90		
90.2(A)	Revised to clarify that some <i>NEC</i> rules apply to removals.	FR-1
90.2(B)	Revised to include "Energy Storage" to the list of <i>NEC</i> scope exclusions.	FR-2
90.3	Revised to permit Chapters 5, 6, and 7 to modify each other.	FR-3
90.7	Revised to require suitability of product safety standards to be compatible with the <i>NEC</i> .	SR-1
Article 100		
Scope	Revised to specify that Part I definitions apply for electrical systems operating at 1000 volts or less, and that Part II definitions apply for electrical systems operating over 1000 volts.	FR-6
Accessible, Readily (Readily Accessible)	Revised to clarify that ready access is not precluded by the use of keys. Added new Informational Note covering supervised or controlled conditions.	SCR-35
Associated Apparatus	Relocated to Article 100 because the term is used in more than one article.	FR-3919
Associated Nonincendive Field Wiring Apparatus	Relocated to Article 100 because the term is used in more than one article.	FR-3923
Building	Revised to correlate with model building codes.	FR-9
Cable Routing Assembly	Revised to include Type PLTC cables in plenum, riser, and general-purpose applications.	FR-4503
Coaxial Cable	Relocated to Article 100 because the term is used in more than one article.	FR-4501
Combustible Dust	Relocated to Article 100 because the term is used in more than one article.	FR-3929
Combustible Gas Detection System	Relocated to Article 100 because the term is used in more than one article.	FR-3904
Communications Equipment	Added informational note to identify that the definition includes computer/data processing equipment.	SR-4506
Communications Raceway	Revised to include Type PLTC cables and data cables associated with information technology and communications equipment.	SR-4505
Composite Optical Fiber Cable	Relocated term to Article 100 because it is used in more than one article.	FR-4513
Conductive Optical Fiber Cable	Relocated term to Article 100 because it is used in more than one article.	FR-4513
Control Drawing	Relocated term to Article 100 because it is used in more than one article.	FR-3906
Cord Connector [as applied to Hazardous (Classified) Locations]	Added term used in multiple hazardous (classified) location articles.	SR-3913
Dust-Ignitionproof	Relocated term to Article 100 because it is used in more than one article.	FR-3907
Dusttight	Relocated term to Article 100 because it is used in more than one article.	FR-3910
Electric Sign	Revised to correlate with product standard by including signs that are electrically operated.	FR-5144
Electrical Circuit Protective System	Relocated term to Article 100 because it is used in more than one article.	FR-4502
Field Evaluation Body (FEB)	Added definition extracted from NFPA 790.	FR-1041

(continues)

Section	Comments	FR/SR/SCR Reference
Field Labeled (as applied to evaluated products)	Added definition associated with equipment that has been field evaluated.	FR-1041
Hermetically Sealed	Relocated term to Article 100 because it is used in more than one article.	FR-3912
Information Technology Equipment (ITE)	Relocated term to Article 100 because it is used in more than one article. Revised to cover IT equipment rated up to 1000 volts.	FR-3340
Innerduct	Relocated term to Article 100 because it is used in more than one article.	FR-4511
Interactive Inverter	Revised to recognize that inverters can be interactive with other than utility power sources.	FR-995
Intrinsically Safe Apparatus	Relocated term to Article 100 because it is used in more than one article.	FR-3920
Intrinsically Safe System	Relocated term to Article 100 because it is used in more than one article.	FR-3921
Mobile Equipment	Relocated term to Article 100 because it is used in more than one article.	FR-3926
Nonconductive Optical Fiber Cable	Relocated term to Article 100 because it is used in more than one article.	FR-4514
Nonincendive Circuit [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3913
Nonincendive Component [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3913
Nonincendive Equipment [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3913
Nonincendive Field Wiring [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3913
Nonincendive Field Wiring Apparatus [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3913
Oil Immersion [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3913
Optical Fiber Cable	Relocated term to Article 100 because it is used in more than one article.	FR4514
Portable Equipment	Relocated term to Article 100 because it is used in more than one article.	FR-3926
Pressurized [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3924
Process Seal [as applied to Hazardous (Classified) Locations]	Added term used in multiple hazardous (classified) location articles.	FR-3999
Purged and Pressurized [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3915
Simple Apparatus [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3921
Structure	Revised to include the phrase “other than equipment.”	FR-13
Unclassified Locations [as applied to Hazardous (Classified) Locations]	Relocated term to Article 100 because it is used in more than one article.	FR-3916

Section	Comments	FR/SR/SCR Reference
Voltage, Nominal	Added informational note on battery units.	SR-24
Article 100, Part II	Revised to indicate that terms are unique to systems operating over 1000 volts.	FR-7
Substation	Relocated from Part I to Part II. Revised to distinguish substations from other types of electrical distribution and control equipment.	FR-2429
Article 110		
110.3(A) Informational Note	Added informational note to clarify equipment can apply to new, used, refurbished, or reconditioned.	FR-31
110.3(C)	Added requirement for product testing, evaluation, and listing to be performed by a qualified testing laboratory in accordance with applicable product standards.	SR-2
110.5	Revised to include aluminum.	FR-39
110.11 Informational Note	Added informational note referring to other codes for flood provision requirements.	FR-35
110.14	Revised to delete the informational note to correlate with new 110.14(D).	FR-41
110.14(D)	Added requirement for tightening torque values and calibrated torque tool to achieve torque value.	FR-40
110.16	Revised to require additional marking requirements for non-dwelling unit service equipment rated 1200 amperes or more.	SR-11
110.21(A)	Revised to include equipment marking requirements for reconditioned equipment.	SCR-22
110.22(C) Informational Note	Added informational note to provide additional information on series tested systems.	FR-44
110.24(A)	Revised to require the calculation to be documented and made available to those authorized to design, install, inspect, maintain, and operate the system.	SR-10
Article 110, Part II	Revised upper level of circuit voltages covered.	FR-47
110.26(A)	Revised to upper level of circuit voltages covered. Added Informational Note referencing <i>NFPA 70E</i> .	FR-15
Table 110.26(A)(1)	Revised to address working spaces for upper level of circuit voltages.	FR-15
110.26(A)(3)	Added exception to correlate with 480.9(D) for top clearances for battery systems on open racks.	FR-15
110.26(A)(4)	Added working space requirements for "limited access" areas.	SR-12
110.26(A)(5)	Added requirement for separation from high-voltage equipment.	FR-15
110.26(E)(2) Exception	Added exception to permit structural overhangs or roof extensions in this zone.	SR-14
110.27(A)	Revised upper level of circuit voltages covered.	SR-16
110.27(C)	Revised upper level of circuit voltages covered.	FR-49
110.28	Revised upper level of circuit voltages covered.	SR-17
Article 110, Part III	Revised upper level of circuit voltages covered.	FR-51
110.30	Revised upper level of circuit voltages covered. Added reference to 110.41.	SCR-21
Table 110.31	Revised to correlate with 110.26(A)(5) and 110.26(F)(2).	SR-19
110.31(B)(1)	Revised to delete "unit substation" to correlate with the definition of "Substation" in Article 100.	FR-23
110.33(A)(2)	Revised upper level of circuit voltages covered.	FR-24
Table 110.34(A)	Revised to correlate with Table 110.26(A)(1).	FR-25
110.34(B)	Revised upper level of circuit voltages covered.	SR-23
110.34(C)	Revised upper level of circuit voltages covered.	FR-27
110.34(D)	Revised to prohibit control by automatic means only.	FR-28
Table 110.34(E)	Revised to correlate with 110.27(A)(4).	SR-21
110.41	Added section that requires pre-energization and operating tests.	FR-36
Article 110, Part IV	Revised upper level of circuit voltages covered.	FR-53
110.73	Revised upper level of circuit voltages covered.	SCR-24
110.74	Revised upper level of circuit voltages covered.	FR-54

(continues)

Section	Comments	FR/SR/SCR Reference
Article 210		
210.1	Revised to state Article 210 contains the general requirements for branch circuits.	FR-7512
210.3	Relocated from 210.2. Revised table by removing cross-references to amendatory branch circuit requirements contained in Chapters 5, 6, and 7 .	SR-303
210.4(D)	Revised to reference 200.4(B) for grouping of all conductors of multiwire branch circuits.	FR-322
210.5(C)(1)	Added exception to requirement for marking conductors supplied from systems with different voltages.	SR-304
210.5(C)(2)	Revised to provide additional means for marking direct current conductors.	SR-305
210.6 D)	Revised to accommodate LED-type luminaires.	FR-345
210.7	Revised to clarify requirement applies to devices and/or equipment on the same mounting strap or yoke.	SR-306
210.8	Revised to provide direction on how receptacle proximity is determined.	SR-318
210.8(A)(7)	Revised to indicate receptacle proximity is measured from top inside edge of sink bowl.	SR-316
210.8(B)	Revised to expand GFCI protection to more receptacle voltage, phase, and current ratings.	SR-322
210.8(B)(3)	Added exception to clarify ready access requirement for GFCI-type receptacles located on rooftops.	SR-322
210.8(B)(5)	Revised to indicate receptacle proximity is measured from top inside edge of sink bowl and to correlate Exception No. 2 with terms used in Article 517 .	SR-322
210.8(B)(9)	Added requirement for GFCI protection of receptacles in crawl spaces.	SCR-117
210.8(B)(10)	Added requirement for GFCI protection of receptacles in unfinished areas of basements.	SR-322
210.8(E)	Added requirement for GFCI protection of 120-volt lighting outlets installed in crawl spaces.	SR-317
210.11(C)(3)	Revised to clarify the required branch circuit can supply receptacle outlets in more than one bathroom.	FR-330
210.11(C)(4)	Added requirement for a 20-ampere branch circuit dedicated to garage receptacle outlets.	SR-324
210.12(B)	Revised to reference AFCI protection methods specified in 210.12 (A) to add bathrooms to the areas required to be protected, and to include “devices” installed at locations not meeting the definition of <i>outlet</i> .	SR-320
210.12(C)	Added requirement for AFCI protection in guest rooms and guest suites.	FR-352, SR-328
210.12(D)	Relocated from 210.12(B) and revised to also include dormitory units.	SR-328
210.17 (2014)	Relocated to 625.40 .	FR-353
210.17	Relocated from 210.18 .	FR-357
210.18	Relocated from 210.3 .	FR-357
210.52(A)(2)	Revised to include work surfaces that are not countertops and to cover fixed panels in exterior and interior walls.	SR-307
210.52(A)(4)	Revised to also apply to work surfaces that are not countertops.	SR-307
210.52(B)(1) Exception No. 2	Revised to permit the exception to be applied to any appliance.	SR-308
210.52(C)	Revised to also apply to work surfaces that are not countertops.	SR-309
210.52(C)(1)	Revised to also apply to work surfaces that are not countertops.	SR-309
210.52(C)(3)	Revised to specify that peninsula countertops are considered to extend from the perpendicular wall at the end of the peninsula.	SR-309
210.52(C)(5)	Revised to also apply to work surfaces that are not countertops.	SR-309
210.52(D)	Revised to clarify receptacle outlet location where the basin is installed in or on a countertop and to specify the type of receptacle outlet permitted in or on a bathroom countertop.	SR-310
210.52(G)	Revised to include garages, accessory buildings, and basements at two-family dwellings.	FR-310
210.52(G)(1)	Revised the requirements for garage receptacle outlets to permit receptacles on the exterior of the garage to utilize the same branch circuit as the required garage receptacles.	SR-326

Section	Comments	FR/SR/SCR Reference
210.64	Revised measurement, location, and applicability. Added exception for services rated more than 120 volts to ground that supply certain types of equipment.	FR-323
210.70(A)(2)	Revised to permit dimmer control of stairway lighting outlet(s).	SR-325
210.71	Added requirement for receptacle outlets in meeting rooms.	SR-329
Article 215		
215.1	Revised to clarify Article 215 requirements are not limited to only feeders supplying branch circuit loads.	FR-338
215.2(A)(1) Exception Nos. 1 and 3	Relocated existing exceptions to directly follow the requirement to which they apply.	FR-337
215.2(A)(1) Exception No. 2	Added exception permitting use of conductor ampacity associated with high insulation temperature rating for that portion of the feeder installed outside of supply and termination equipment enclosures.	FR-337
215.3	Revised to clarify that conductors operating at up to 1000 volts are covered in Parts I through VIII.	FR-335
215.9	Revised to require feeder level GFCI devices be “readily accessible.”	FR-334
215.12(A)	Revised to clarify grounded conductor identification is required only where conductor is insulated.	FR-332
215.12(C)(2)	Revised to provide additional means for marking direct current conductors.	SR-327
Article 220		
Table 220.3	Revised to remove references to requirements that are not directly related to calculating electrical load and those references to load calculation requirements contained in Chapters 5, 6, and 7.	FR-340
220.12 Exception No. 2	Added exception for bank and office occupancies permitting reduction of lighting load based on allowable load density prescribed by adopted energy codes.	SR-313
220.14(G)	Revised to clarify that show window load calculation is based on linear measurement.	FR-327
220.87	Revised to clarify how the 15 minute maximum demand is determined.	FR-344
Article 225		
225.4	Revised to update conductor insulation type to reflect current wire and cable manufacturing practice.	FR-904
225.7(D)	Revised upper level of circuit voltages covered.	FR-902
225.12	Revised to reflect materials currently used in the manufacture of insulators.	FR-905
225.19(A)	Revised to correlate with the <i>National Electrical Safety Code</i> .	FR-908
225.27	Revised to expand applicability of requirement.	FR-920
Article 230		
230.7 Exception No. 1	Revised to use terminology more commonly associated with supply-side installations.	FR-926
230.10	Revised to also prohibit service equipment from being supported by vegetation.	FR-928
230.24(B)	Added requirement covering service conductor clearance above railroad tracks.	FR-929
230.29	Revised to cover bonding metal structures used to support service conductors.	SR-909
230.30(A) Exception	Revised to replace “judged to be suitable” with “approved.”	FR-930
230.41 Exception	Revised to replace “judged to be suitable” with “approved.”	FR-932
230.42(A)	Revised to clarify how minimum conductor ampacity and busway rating is determined.	SR-910
230.44	Revised to clarify requirements for single conductors installed in cable tray and to provide separate list item for tray cable.	SR-911
230.53	Revised to provide more objective assessment criteria.	FR-903
230.54(C)	Revised to clarify requirement applies to service raceways and service cables.	SR-912
230.66	Added new exception to allow the use of utility supplied and controlled meter sockets that are not listed.	SR-919

(continues)

Section	Comments	FR/SR/SCR Reference
230.82(6)	Revised to include additional electric supply systems.	FR-939
230.91	Revised to clearly indicate location of service disconnecting means in relation to fuses used as the service overcurrent protective device.	FR-948
230.95(C)	Revised to specify test procedure and who can perform the required testing.	SR-915
Article 240		
240.6(A)	Revised to move the standard ampere rating sizes to new Table 240.6(A) .	FR-2703
240.67	Added requirement to provide means to reduce incident energy for fuses rated 1200 amperes or higher.	SR-2702
240.87	Revised to add two additional arc flash mitigation methods. Added Informational Notes to assist with application.	FR-2706
Article 250		
Table 250.3	Revised to include references to 820.106 and Articles 770 and 830 .	FR-1202
250.4(A)(1) Informational Note	Added Informational Note to reference NFPA 780.	SCR-48
250.4(B)(1) Informational Note	Added Informational Note to reference NFPA 780.	SCR-49
250.22	Added list item (6) to correlate with 393.60(B) .	SR-1203
250.24(C)(1)	Revised to include “cable” to provide consistent sizing requirements for raceways and cables.	FR-1209
250.24(C)(2)	Revised to include “cable” to provide consistent sizing requirements for raceways and cables.	FR-1210
250.30(A)(1)	Revised to replace “transformer” with “separately derived system.”	FR-1213
250.30(A)(4)	Revised to better describe a grounding electrode and recognize the water pipe and the structural metal frame as covered in 250.68(C) that are being used are not grounding electrodes.	SR-1210
250.36(A)(6)	Revised to better describe a grounding electrode and include the conductors that are suitable to extend the grounding electrode connection.	SR-1206
250.52(B)(3)	Added list item to specify that pool-bonding grids as prescribed in 680.26(B)(1) and (B)(2) are not permitted to be used as a grounding electrode.	SR-1209
250.60 Informational Note 1 & 2	Revised editorially to correlate with NFPA 780.	SR-1211
250.64(F)(3)	Revised to include length requirements to correlate with changes made to 250.64(D)(1)(3) in the 2014 <i>NEC</i> .	FR-1226
250.66(A), (B), and (C)	Revised to clarify “daisy chaining” grounding electrodes to form a grounding electrode system and sizing requirements.	SR-1215
250.68(C)(1)	Revised to identify interior metal water piping no more than 1.52 m (5 ft) inside of a building is permitted to extend the connection to a grounding electrode.	SCR-51
250.68(C)(2)	Relocated text from 250.52(A)(2) to permit the structural metal frame of a building to serve as a conductor to interconnect electrodes when the hold-down bolts for a steel column are connected to a concrete encased electrode.	SR-1216
250.68(C)(3)	Revised to permit a rebar-type concrete encased electrode to extend the grounding electrode connection and provide additional installation requirements to prevent any corrosion due to contact with the earth.	SR-1216
250.94	Revised to include an alternate connection option that allows connections to be made on a common busbar with other bonding jumpers.	FR-1215
250.102	Revised to add “grounded conductor” to the title and add aluminum and copper clad aluminum to clarify size requirements for larger conductors if the ungrounded supply conductors are different material than the bonding jumper.	FR-7509
250.104(A)(1)	Revised to provide permitted locations to bond metal water piping to and correlation with applicable sections for sizing bonding jumpers.	SR-1220
250.104(A)(2)	Revised to change reference from 250.122 to 250.102(D) .	SR-1220
250.104(B)	Revised to include that, where bonded to one or more grounding electrodes, the grounding electrode conductor or bonding jumper to the grounding electrode must be of sufficient size and to change reference from Table 250.102(C)(1) to 250.122 .	SR-1220

Section	Comments	FR/SR/SCR Reference
250.104(D)(1) and (2)	Revised to change the reference from Table 250.66 to Table 250.102(C)(1) for sizing bonding jumpers.	SR-1220
250.118(5)c	Revised to provide a maximum trade size to correlate with the U.L. listing for flexible metal conduit used for equipment grounding.	FR-1229
250.119(B)	Revised to require identification to encircle the conductor.	SR-1221
250.119(C)	Revised to require equipment grounding conductors in flexible cords to be insulated.	FR-1231
250.122(F)	Revised to separate requirements for conductors in parallel for individual conductors installed in raceways or cable tray and installation of multiconductor cables. Revised to include sizing requirements for the equipment grounding conductors.	SCR-52, SCR-53
250.148	Revised to clarify that all of the equipment grounding conductors present in the box are required to be connected together regardless of the circuit they are associated with.	SR-1227
250.186	Revised to provide clarity and consistency with 250.24(C). Reference to Table 250.66 and 12½ percent requirements were deleted and replaced with a reference to Table 250.102(C)(1).	SR-1228
Article 280		
280.12	Relocated from 280.2.	SR-1234
280.14	Relocated from 280.12.	FR-1248
Article 300		
300.3(B)(1)	Revised to include the neutral and grounded conductors in the isolation permitted.	FR-601
300.3(B)(4) Exception	Revised to add “column width panelboard” to the title.	FR-602
Table 300.5	Revised to add a note to address burial depth requirements for pool, spa, and fountain lighting.	SR-623
300.5(B)	Revised to delete the last sentence since 110.14(B) already covers this requirement.	FR-605
300.5(D)(4)	Revised to include electrical metallic tubing to the permitted raceways.	FR-606
300.5(F)	Revised to include conductors among the items to protect from damage.	FR-607
300.5(G)	Revised to require spare or unused raceways to be sealed with sealants identified for use with cable insulation, conductor insulation, bare conductors, shields, or other components..	FR 608
300.5(J)	Revised informational note to add “cables and conductors.”	FR-609
300.7(B)	Revised to include expansion-deflection or deflection fittings as acceptable methods.	SR-602
300.11	Revised to include a separate section to address requirements for wiring systems above suspended ceilings.	SR-603
300.22(B) Exception	Added exception that permits wiring methods meeting listed low smoke and flame spread properties.	FR-614
300.22(C)(3)	Revised to correlate with 300.22(C)(1) for low smoke and heat release properties.	SR-605
300.37 Exception	Added exception for airfield lighting cable.	SR-624
Article 310		
310.15(B)(3)(a)(4)(d) Exception	Added exception to require 60 percent adjustment factor if stacked or bundled longer than 600 mm (24 in.).	FR-1503
310.15(B)(3)(c)	Deleted Table 310.15(B)(3)(c). Added requirement that, where the distance above the roof to the bottom of the raceway or cable is less than 23 mm (¾ in.), a temperature adder of 33°C (60°F) shall be included.	SR-1506
310.15(B)(7)	Revised to include a single-phase 208Y/120-volt system.	SR-1505
310.15(B)(7)(5)	Added item requiring application of correction or adjustment factors.	FR-1504
Table 310.15(B)(16), (18), and (20)	Revised to include a reference to 310.15(B)(3)(a).	FR-1505
310.60(B)	Relocated from 310.60(C).	FR-1520
310.60(B) Informational Note 1	Revised to delete reference to IPCEA publication, which is no longer available.	FR-1506
Table 310.104(A)	Revised to include Thermoset XHHN and moisture-resistant Thermoset XHWN and XHWN-2.	FR-1517

(continues)

Section	Comments	FR/SR/SCR Reference
Article 312		
312.1	Revised to indicate application does not apply above 1000 volts unless specifically referenced elsewhere in the <i>NEC</i> .	FR-2401
Table 312.6(A) and Note 2	Revised to include compact stranded aluminum conductors.	SR-2403
312.8	Revised to permit power monitoring equipment to be installed within switch or overcurrent device enclosures.	SR-2401
Article 314		
314.15	Revised to include specifications on the sizing and geometry for drainage openings.	FR-2405
314.16(A) and (B)	Revised to include requirements for boxes that include internal barriers.	FR-2406
314.17(B)	Revised to include requirements for minimum cable sheath length for metal boxes.	FR-2407
314.20	Revised to clarify the requirements apply to flush-mounted installations.	SR-2404
314.23(B)(1)	Revised to clarify mounting hole requirements.	SR-2405
314.27(E)	Revised to clarify support requirements for separable attachment fittings.	SR-2406
314.28(E)(1)	Revised to require power distribution blocks to be marked "suitable for use on the line side of service equipment" if they are installed on the line side.	SR-2407
Article 320		
320.6	Added requirement for Type AC cable and fittings to be listed.	FR-1808
320.30(A)	Revised to require listed cable ties identified for securement.	SR-1802
320.30(D)	Revised to clarify supporting and securing are not required for these specific applications.	FR-1812
Article 322		
322.6	Added requirement for Type FC cable and fittings to be listed.	FR-1801
Article 324		
324.12 (5)	Revised to not prohibit Type FCC in administrative areas of hospital and school buildings.	SR-1804
Article 328		
328.6	Added requirement for Type MV cable and fittings to be listed.	FR-1814
328.14	Revised informational note to reference NECA MV cable installation standard.	FR-1819
328.30	Added requirement for supporting and securing Type MV cable.	SR-1815
Article 330		
330.6	Added requirement for Type MC cable and connecting fittings to be listed. (Listing requirement covering MC cable fittings was in deleted 330.40.)	FR-1816
330.15	Added requirement covering exposed installations of Type MC cable.	FR-1820
330.30(A)	Revised to require listed cable ties identified for securement.	SR-1807
330.30(D)	Revised to clarify supporting and securing are not required for these specific applications.	FR-1822
330.40 (2014)	Relocated to new 330.6.	FR-1817
Article 332		
332.6	Added requirement for Type MI cable and fittings to be listed.	FR-1806
Article 334		
334.12(A)(2)	Revised to more accurately describe the space above a dropped or suspended ceiling.	FR-1826
334.30	Revised to require listed cable ties identified for securement.	SR-1811
334.30(B)(2)	Revised to specify occupancy types in which unsupported length of cable can be installed in the space above an accessible ceiling.	FR-1831
334.80	Revised to replace "derated" with "calculated."	FR-1825
Article 336		
336.6	Added requirement for Type TC cable and fittings to be listed.	FR-1833
336.10(2)	Revised to permit Type TC cable in cable tray that is mechanically discontinuous.	FR-1832

Section	Comments	FR/SR/SCR Reference
336.10(7)	Revised to clarify installation conditions and to specify exception applies only to this permitted use.	FR-1832
336.10(9)	Revised to permit use for generator connections at one- and two-family dwellings.	SR-1808
336.10(10)	Relocated condition covering direct burial from 336.12(4).	FR-1839
Article 338		
338.6	Added requirement for Types SE and USE cables and fittings to be listed.	FR-1827
338.10(B)(4)	Revised to limit conductor operating temperature restriction to cables with ungrounded conductors sized 10 AWG and smaller.	FR-1828
Article 340		
340.6	Revised to require fittings used with Type UF cable to be listed.	FR-1829
Article 342		
342.14	Revised to clarify acceptable fittings.	FR-2129
342.60	Revised to include stainless steel.	FR-2131
Article 344		
344.14	Revised to clarify acceptable fittings.	FR-2137
Article 348		
348.30(A)	Revised to require cable ties to be listed and identified for securement and support.	FR-2166
Article 350		
350.10	Revised to remove specific references with a general reference to Chapter 5.	FR-2168
350.28	Added section to require trimming and removing of rough edges.	FR-2169
350.3	Revised to require cable ties to be listed and identified for securement and support.	FR-2170
Article 355		
355.12(A)	Revised to update 501.10(B)(3) with 501.10(B)(1)(6).	FR-2111
Article 356		
356.10 Informational Note and (5)	Revised to replace "LFNC-B" with "LFNC."	FR-2102
356.12(2)	Revised to replace "approved" with "listed."	FR-2103
356.30	Revised to replace "LFNC-B" with "LFNC" and require cable ties to be listed and identified for securement and support.	FR-2104
Article 358		
358.10	Revised to add clarity and include stainless steel EMT. Relocated requirements from 358.12.	SR-2102
358.12	Revised to add clarity. Relocated requirements to 358.10.	SR-2103
358.14	Relocated 358.12(6) to new section. Revised to clarify acceptable fittings.	FR-2142
358.100	Revised to clarify metal types used in the manufacture of EMT.	FR-2143
Article 362		
362.12	Revised to remove the upper voltage limitation.	FR-2114
362.20(B)	Revised to increase the maximum size permitted.	FR-2116
362.30	Revised to require cable ties to be listed and identified for securement and support.	FR-2115
Article 366		
366.20	Added requirement for grouping where conductors are installed in parallel.	FR-2179
366.22	Revised to add "cables."	FR-2174
Article 368		
368.17(C) Exception 4	Added exception to permit alternative methods of providing ready access.	FR-2148
Article 368, Part IV	Revised upper level of circuit voltages covered.	FR-2149
368.240	Revised upper level of circuit voltages covered.	FR-2151

(continues)

Section	Comments	FR/SR/SCR Reference
Article 370		
370.12	Revised to correlate with Chapter 5 .	FR-2152
370.23 Exception	Revised to remove the upper voltage limitation.	FR-2153
Article 372		
Article 372	Renumbered article to align with the Chapter 3 numbering format.	SR-2105
Article 374		
Article 374	Renumbered article to align with the Chapter 3 numbering format.	SR-2106
Article 376		
376.20	Added requirement for grouping where conductors are installed in parallel.	FR-2182
376.22	Revised to add "cables."	FR-2183
376.56(B)(1)	Revised to require power distribution blocks to be marked "suitable for use on the line side of service equipment" if installed on the line side of service equipment.	SCR-38
Article 378		
378.20	Added requirement for grouping where conductors are installed in parallel.	FR-2106
378.22	Revised to add "cables."	FR-2107
Article 384		
384.6	Revised to remove "closure strips."	SR-2111
384.10	Revised to remove the voltage limitation and change the reference to Chapter 5 .	FR-2158
384.22	Revised to add "cables."	FR-2159
Article 386		
384.6	Revised to remove "closure strips."	SR-2111
Article 392		
392.10(E)	Added requirement for airport lighting cables installed in cable trays.	SR-2107
392.20(A) and B)	Revised upper level of circuit voltages covered	FR 2123
392.22(A)	Revised to address requirements for fill calculations where dividers are used.	FR-2124
392.80(A) and (B) Informational Notes	Added informational note that refers to 110.14(C) and 110.40 for additional conductor limitations.	SR-7506
Article 396		
396.2	Added definition of <i>insulated conductor</i> .	SR-1814
Article 398		
398.1	Revised to increase voltage limitation from 600 volts to 1000 volts.	FR-1838
Article 400		
Article 400 Title	Revised to add "flexible" before "cable" to correlate with 400.1 .	Global FR-1510
400.1 Informational Note	Added informational note to advise that flexible cords used in listed cord sets and power supply cords are covered by this article.	SCR-36
400.3	Revised to add "flexible" before "cable" to correlate with 400.1 .	Global SR-1502
Table 400.5(A)(1)	Revised to add ampacities for cords with conductor sizes 7, 5, and 3 AWG.	FR-1518
400.6(A)	Revised to add "flexible" before "cable" to correlate with 400.1 .	Global SR-1502
400.10	Relocated from 400.7 for uses permitted and revised to include "flexible."	Global FR-1519
400.12	Relocated from 400.8 for uses not permitted. Revised to include "flexible cord sets and power supply cords."	Global SR-1504
400.12(5)	Added exception to correlate with 300.22(C)(3) .	SR-1504
400.14	Revised to add "flexible" before "cable" to correlate with 400.1 .	Global SR-1502
400.17	Revised to add "flexible" before "cable" to correlate with 400.1 .	Global SR-1502

Section	Comments	FR/SR/SCR Reference
400.21(A)	Revised to add “flexible” before “cable” to correlate with 400.1 and “copper” before “flexible stranding.”	FR-1508
400.21(B)	Revised to add “flexible” before “cable” to correlate with 400.1.	Global SR-1502
Article 402		
402.3 Informational Note	Revised to correlate with 310.104.	FR-1515
402.12	Relocated from 402.11 for uses not permitted.	Global FR-1519
Article 404		
404.2(C)	Revised to add new requirement for switching devices to meet 404.22 and add exception to address replacement/retrofit limitations and numerical limits on neutral currents. Revised to clarify conditions exempt from providing a grounded conductor at switch locations.	SCR-54
404.9(B)	Revised to require metal faceplates be grounded.	FR-2417
404.14(F)	Revised to include “or control device.”	FR-2418
404.15 (2014)	Relocated to new 404.20.	FR-2419
404.16 (2014)	Relocated to new 404.26.	FR-2420
404.17 (2014)	Relocated to new 404.27.	FR-2421
404.18 (2014)	Relocated to new 404.28.	FR-2422
404.22	Added requirement for electronic lighting control switches and exception to correlate with 404.2(C) Exception.	SCR-55
Article 406		
406.2	Added definition for <i>outlet box hood</i> .	SCR-56
406.3(E)	Revised to cover required content and location of the marking on controlled receptacles.	SR-5111
406.3(F)	Added requirement for 125 volt, 15- and 20-ampere receptacles that also provide Class 2 power.	FR-5101
406.4 (B) Exception No. 2	Revised to expand applicability to “generator sets.”	FR-5103
406.4(D)(2)	Revised marking requirement for replacement receptacles at outlets without an equipment grounding conductor. Added informational notes covering cord-and-plug-connected utilization equipment requiring equipment grounding connection.	SR-5104
406.4(D)(3)	Revised to address requirements for replacements, where GFCI protection would be required.	FR-5106
406.4(D)(4)	Revised requirement for AFCI protection of replacement receptacles and added exceptions.	SCR-47
406.4(D)(5)	Revised to exempt replacement non-grounding receptacles from tamper-resistant requirement.	FR-5107
406.5(E)	Revised to limit applicability to only countertop surfaces.	SR-5106
406.5(F)	Added requirement specific to work surfaces that are not considered to be countertops.	SR-5106
406.5(G)	Relocated requirement covering orientation of receptacles in countertop and other work surfaces.	SR-5106
406.5(H)	Relocated requirement covering receptacles installed in seating areas. Revised item (1) to recognize that all furniture power distribution equipment is cord-and-plug-connected.	FR-5108
406.6(D)	Added requirement to cover receptacle faceplates with night light and/or USB port.	FR-5109
406.9(B)(1)	Revised to require “extra-duty” marking only on listed outlet box hoods.	SR-5102
406.12	Revised to include receptacles rated 15- and 20-amperes, 250 volts. Added informational note.	SCR-45
406.12(D)	Added requirement for tamper-resistant receptacles in certain educational facilities.	SCR-45
406.12(E)	Added requirement for tamper-resistant receptacles in certain health care facilities.	SCR-45
406.12(F)	Added requirement for tamper-resistant receptacles in certain places of assembly.	SCR-45
406.12(G)	Added requirement for tamper-resistant receptacle in dormitories.	SCR-45
406.12 Exception	Revised exception to include added occupancy types.	SCR-45
406.15	Deleted requirement covering dimmer-controlled receptacles for lighting loads.	FR-5113

(continues)

Section	Comments	FR/SR/SCR Reference
Article 408		
408.3(A)(2)	Revised to add “panelboard” and new exception to correlate with 408.36.	SR-2410
408.3(C)	Revised to update the reference from “Table 250.66” to “250.102(C)(1).”	SR-2412
408.4(B)	Revised to require marking to be permanent, durable, and not handwritten.	FR-2427
Article 409		
409.22	Revised to create new subdivisions “(A)” and “(B)” and new requirements for short-circuit current calculation documentation.	SCR-1
409.110(3)	Revised to require documentation for location of disconnecting means for all circuits 50 volts or more.	SR-3004
Article 410		
410.62(B)	Revised to correlate cord terminology with Table 400.4. Added informational note regarding proper application of flexible cord.	FR-5117
410.62(C)(1)	Revised to clarify conditions under which luminaires are permitted to be connected with flexible cord.	SR-5109
410.130(G)(1) Exception No. 2	Revised to clarify that the exception applies to the entire luminaire rather than individual ballasts.	FR-5119
Article 411		
Article 411, Title	Revised to correlate title with the types of “low-voltage” lighting systems covered.	FR-5147
411.3(A)	Revised to remove 30-volt limitation.	FR-5147
411.3(B)	Revised to remove reference to limited energy tables in Chapter 9.	FR-5147
411.4(A) and (B)	Revised for correlation with expanded types of “low-voltage” lighting systems covered and to clarify that fixed wiring methods are to be selected from Chapter 3.	FR-5147
411.6(D)	Revised to apply to insulated conductors in exposed and concealed locations.	FR-5147
Article 422		
422.2	Deleted <i>vending machine</i> definition.	FR-4875
422.5	Revised to consolidate all appliance GFCI requirements into one section.	FR-4801
422.5(A)	Revised to specify voltage, system, and current ranges of appliances requiring GFCI protection.	FR-4801
422.5(B)	Revised to identify permitted methods for appliance GFCI protection and to specify requirements for the GFCI devices.	FR-4801
422.6	Added requirement on listing of appliances.	SR-4801
422.14 (2014)	Deleted requirement on equipment covered in new Article 425.	FR-4874
422.16(B)(2)	Revised to create separate requirements on cord length and receptacle location for each appliance type and clarify the exception.	SR-4804
422.16(B)(4)	Revised maximum cord length to clarify text in the exception and terminology on “protecting against physical damage.”	SR-4805
422.18	Revised to add new listed method for supporting ceiling (paddle) fans.	SR-4806
422.21	Revised to establish maximum amount of combustible surface area between ceiling (paddle) fan canopy and edge of associated outlet box.	FR-4806
422.23 (2014)	Relocated to 422.5(A).	FR-4807
422.30	Revised to recognize that an appliance can be supplied by multiple feeders or multiple branch circuits and that the multiple disconnects for a single appliance have to be grouped and identified to indicate there are multiple disconnecting means.	FR-4811
422.31(A)	Revised to establish safe work practice conditions for disconnecting means.	FR-4812
422.31(C)	Revised for consistency with similar requirements on equipment disconnecting means.	FR-4813
422.33(A)	Revised to expand requirement to cover separable connections other than cord and plug.	SR-4807

Section	Comments	FR/SR/SCR Reference
422.49 (2014)	Relocated to 422.5(A) .	FR-4808
422.51 (2014)	Relocated to 422.5(A) .	FR-4809
422.52 (2014)	Relocated to 422.5(A) .	FR-4810
Article 424		
424.3(A)	Revised to only specify maximum rating of branch circuits supplying two or more outlets for fixed electric space-heating equipment.	FR-4872
424.9	Revised to delete text redundant to 110.2 .	FR-4821
424.19	Revised disconnecting means requirements for heating equipment with multiple supply circuits.	FR-4822
424.34	Revised requirements covering nonheating leads installed by the equipment manufacturer.	FR-4824
424.35	Revised to remove color-coding requirement for nonheating leads.	FR-4825
424.36	Revised to clarify assumed ambient temperature for wiring installed above heated ceilings.	FR-4815
424.38(A)	Revised to permit heating cables to leave the room in which they originate.	FR-4826
424.38(B)	Revised and added conditions under which heating cable cannot be used.	FR-4827
424.39	Revised to clarify requirement applies only to ceiling installations of space heating cable.	SR-4809
424.40	Revised conditions under which heating cable can be spliced.	FR-4829
424.41(B)	Revised conditions under which adjacent runs of heating cable are permitted.	FR-4831
424.41(C)	Revised requirement for isolating conductive surfaces from heating cable.	FR-4832
424.44(A) (2014)	Deleted limitation on cable heat rating per linear foot.	FR-4833
424.44(B)	Revised of conditions under which adjacent runs of heating cable are permitted.	FR-4833
424.44(C) (2014)	Deleted requirement for separation between heating cable and metal embedded in concrete or poured masonry floors.	FR-4833
424.45	Added requirement covering installation of heating cables under floor coverings.	FR-4834
424.45 (2014)	Relocated to 424.46	FR-4834
424.47	Added requirement covering heating cable circuit labels.	FR 4823
424.66	Revised to remove all requirements on working space about duct heating equipment for correlation with new 110.26 (A)(4) .	SCR-40 and 42
424.70	Revised to clarify requirements for installation of electrode-type boilers are in Part VIII .	FR-4820
424.92(D) (2014)	Deleted requirement covering heating panel circuit labels.	SR-4811
424.94	Revised to clarify assumed ambient temperature for wiring installed above heated ceilings.	FR-4816
424.95	Revised to clarify assumed ambient temperature for wiring installed in interior walls.	FR-4817
424.97	Revised condition under which excess nonheating leads can be cut in the field. Revised to clarify which conductors are not subject to branch circuit ampacity requirements.	FR-4836
424.98 (2014)	Deleted limitation on panel or panel set heat rating per square foot.	FR-4837
424.99(B) (2014)	Deleted limitation on panel or panel set heat rating per square foot.	FR-4844
424.99(B)(4)	Revised to remove installation condition that is otherwise specified in the manufacturers' installation instructions.	FR-4839
424.99(B)(5)	Revised to specify that GFCI protection is required for all installations and to incorporate informational note into a requirement.	SR-4812
424.99(B)(6)	Added requirement for heating panels and heating panel sets to have integral grounding means.	SR-4812
Article 424, Part X	Added Part X containing installation requirements for low-voltage fixed electric space-heating equipment.	FR-4843
Article 425		
Article 425	Added article covering fixed resistance and electrode industrial process heating equipment.	SR-4813

(continues)

Section	Comments	FR/SR/SCR Reference
Article 426		
426.1(B)	Added informational note referencing industry standard containing relevant testing, design, installation, and maintenance provisions.	FR-4845
426.32	Revised to limit the secondary output to 30 volts maximum and to remove the condition permitting higher equipment operating voltages if GFCI protection is provided.	FR-4846
Article 427		
427.20	Revised to clarify required marking of nonheating leads.	FR-4848
427.27	Revised to limit the secondary output to 30 volts for general applications with new exception permitting higher secondary voltage output where installed at industrial establishments.	FR-4849
Article 430		
430.2, Part Winding Motor	Revised to relocate the first paragraph from 430.4 to a new definition.	FR-3010
Table 430.10(B)	Revised to permit smaller gauge conductors to correlate with 430.22(G)(1) and (2).	FR-3012
Table 430.12(C)(1)	Revised to eliminate the gap in nominal voltages in the table.	FR-3019
430.22(F)	Revised to reference all motors in 430.22(A)–(G).	FR-3013
430.53(D)(4)	Added subsection that includes requirements for a 7.5 m (25 ft) tap for a single motor.	FR-3014
430.99	Added requirement for documentation and availability of short circuit current calculation.	FR-3016
430.130(A)(4)	Added requirement for the short circuit ground fault device to be provided as an integral part of power conversion equipment.	FR-3017
Table 430.249 and Table 430.150	Revised to correlate voltages referenced above the tables with the voltages in the tables.	FR-3018
Article 440		
440.4(B), Exception 3	Revised to remove equipment supplied from a branch circuit protected at 60 amperes or less.	FR-3004
440.9	Added requirement for a wire type equipment grounding conductor to be provided in the outdoor portion of the metallic raceways that use non-threaded fittings.	FR-3005
440.10	Added requirements for short-circuit current and documentation data for calculations.	FR-3006
440.33	Revised text into a list format for clarity.	FR-3009
440.65	Revised to include a heat detecting circuit interrupter (HDCI).	FR-3021
Article 445		
445.10	Added informational note referencing NFPA 37.	FR-4587
445.11	Revised the required markings on generators.	FR-3617
445.13	Revised to add requirement for connecting tap conductors to load side of generator OCPDs other than portable generators rated 15 kW or less.	SR-3618
445.14	Revised to include direct-current voltage level at which live parts have to be made inaccessible to accidental contact by unqualified persons.	SR-3614
445.18(A)	Added subdivision on generator disconnecting means. Revised requirement on interruption of ungrounded conductors by generator disconnecting means.	SCR-82
445.18(B)	Added subdivision on prime mover shutdown. Revised the conditions under which it can be used as the generator disconnecting means and for a remotely operated shutdown for larger generators.	SR-3620
445.18(C)	Added subdivision on generators operating in parallel. Revised disconnecting means and generator isolation requirements.	FR-3661
Article 450		
450.5 Exception	Deleted the exception.	FR-2431
450.23(A)	Added informational note that provides examples of restrictions for listing of liquid.	FR-2432
450.23(B)	Added informational note that provides examples of restrictions for listing of liquid.	SR-2415
450.43(C)	Revised to correlate with 110.26(C)(3).	FR-2433

Section	Comments	FR/SR/SCR Reference
Article 480		
480.3	Added requirement on listing of batteries and battery management equipment.	SR-3629
480.4(A)	Revised requirement on corrosion prevention at battery connections.	FR-3641
480.4(C)	Added informational note providing guidance on conductor connections at battery terminals.	FR-3642
480.6	Revised maximum direct current voltage for batteries associated with engine starting, ignition, or control.	SR-3615
480.7(A)	Revised voltage level at which direct current disconnects are required.	SR-3616
480.7(B)	Revised requirements for remotely controlled battery disconnecting means.	FR-3664
480.7(D)	Revised notification requirements. Added informational note on equipment short-circuit current rating and its relationship to establishing safe work practices per NFPA 70E.	SCR-83
480.8	Revised requirements for insulating conductive battery containers from ground.	FR-3644
480.9	Revised to consolidate requirements on battery support systems.	FR-3645
480.10(A)	Added informational note referencing standard on ventilation of storage battery systems.	FR-3646
480.10(D)	Revised the working space requirements for top terminal batteries. Revised informational note by including reference to applicable standard for clearances about VRLA batteries.	FR-3647
480.11(A)	Revised requirement on vented cell flame arresters. Added informational note on their function.	FR-3649
480.11(B)	Revised requirement for pressure-release vents on only certain sealed batteries.	FR-3650
Article 490		
490.3	Revised to change title to "Other Articles." Relocated "oil-filled equipment" to subdivision "(A)." Added "(B)" for enclosures in damp or wet locations.	FR-2434
Article 500		
500.2 (2014)	Deleted definition section because all defined terms have been relocated to Article 100 .	FRs-3918, 3904, 3906, 3907, 3909, 3912, 3913, 3915, 3916, and 3929
500.4(B) Informational Notes	Added Informational Note No. 6.	FR-3962
500.5(A)	Revised section title and correlated area classification information on ammonia with the ASHRAE standard.	FR-3934
500.6 Exception	Revised to include Class III materials.	FR-3985
500.8(C)(3)	Revised to permit alternate material group marking on equipment. Added informational note providing examples of the type of information that the alternate marking could include.	FR-3984
500.8(D)(2)	Deleted Table 500.8 (D)(2) and associated text.	FR-3982
500.8(E)(2) and Informational Note	Revised to make metric thread engagement uniform for all gas groups.	SR-3921
Article 501		
501.10(A)(1)(a) Exception	Revised to permit additional type of nonmetallic conduit and to clarify intended application of the exception.	FR-3940
501.10(A)(2)	Revised to clarify only one of the methods can be employed for a given installation.	SCR-90
501.10(B)(1)	Revised to allow threadless fittings with metal conduit and cablebus.	SR-3901
501.15(A)(1)	Revised to provide additional conditions associated with factory-sealed enclosures and to no longer permit conduit bodies between a seal fitting and an explosionproof enclosure.	SR-3922
501.15(D)(1)	Revised to establish proximity between cable seal and enclosure in which cable terminates.	FR-3973
501.15(E)(3)	Revised to clarify the conditions under which sealing of cables is not required.	FR-3972

(continues)

Section	Comments	FR/SR/SCR Reference
501.105(B)(1) through (5)	Revised to reorganize, clarify, and expand temperature marking requirements for enclosures containing certain types of equipment.	FR-3971
501.105(B)(6)	Revised to permit interlocked receptacle and attachment plug connection that cannot be opened or energized under load and to clarify existing requirements on cord-and-plug connection of instrumentation circuits.	SCR-92
501.115(B)(1)(3)	Revised to describe markings on enclosures considered to be factory sealed.	SR-3923
501.125(A)(4)	Revised to restrict the use of this type of machine to industrial locations that have restricted access and qualified persons servicing the equipment.	FR-3966
501.125(B)	Revised to reorganize requirements for clarity and to add a condition under which a shaft bonding device is permitted. Added informational note providing guidance on shaft bonding devices and preventing ignition capable energy discharge.	SR-3927
501.145(B)	Deleted exception for certain types of cord-and plug-connected equipment.	FR-3975
Article 502		
502.10(A)(1)(5)	Added requirements under which Type ITC-HL cable can be installed in Class II, Division 1 locations.	FR-3942
502.10(B)(1)(6) and (9)	Added Type MV, Type TC-ER, and cablebus to wiring methods permitted in Class II, Division 2 locations.	FR-3943
502.125(B) Exception	Added machines with sealed components and openings to list of permitted alternative equipment.	SCR-4
Article 503		
503.10(A)(1)(4) and (5)	Added Type MV cable and cablebus to wiring methods permitted in Class III, Division 1 locations.	FR-3944
Article 504		
504.1	Revised to expand applicability to all hazardous (classified) locations covered in Chapter 5 .	FR-3992
504.2	Relocated definitions used in more than one article to Article 100 .	FRs-3919, 3920, and 3921
504.10 (A)	Revised to convert exception text into positive statement.	FR-3991
504.10(B) and (D)	Revised for improved organization of requirements by relocating text related to the maximum surface temperature of “simple apparatus” from 504.10(B) to 504.10(D) .	FR-3990
504.60(A) and (B)	Revised to clarify hazardous (classified) location bonding requirements for metal intrinsically safe apparatus and metal raceways.	FR-3998
Article 505		
505.2	Relocated definitions used in more than one article to Article 100 .	FRs-3905, 3917, and 3922
505.4(A)	Revised existing informational note. Added informational note on gas detection equipment.	SR-3919
505.4(B)	Added informational notes on portable/transportable equipment and equipment utilizing optical emissions technology.	SR-3919
505.5(A)	Revised section title and correlated area classification information on ammonia with ASHRAE standard. Revised informational note on ammonia refrigeration systems to clarify type of refrigerant system covered and to add a referenced standard.	SCR-5
505.7(F)	Revised to provide condition under which equipment with short-circuit current rating (SCCR) exceeding 10 kA is permitted.	FR-3978
505.8(A)	Revised to correct title of protection technique to correlate the use of the term in associated requirements.	FR-3980
505.9(C)(2) Informational Note No. 4	Revised to include Class I, Zone 1 in two examples of zone equipment marking.	FR-3977
505.9(E)(2)	Revised to correlate metric thread engagement with equipment standards for flame-proof equipment.	FR-3979

Section	Comments	FR/SR/SCR Reference
505.9(F)	Revised to clarify requirement for sealing optical fiber cables with or without current-carrying conductors.	FR-3988
505.15(A)	Revised to clarify limitations on type of circuits that can connect to equipment in Class I, Zone 0 locations.	FR-3986
505.15(C)(1)(9)	Added cablebus to wiring methods permitted in Class I, Zone 2 locations.	FR-3946
505.16(B)(2)	Revised to describe markings on enclosures considered to be factory sealed.	SR-3924
Article 506		
506.2	Relocated definitions used in more than one article to Article 100 .	FRs-3903, 3908, 3911, 3914, 3923, 3924, and 3925
506.4(B)	Added informational note on equipment utilizing optical emissions technology.	FR-4000
506.6(A)	Revised to correlate with relevant materials standard and with Article 500 . Revised to incorporate informational note into material group description.	SCR-9
506.6(B)	Revised to correlate with relevant materials standard and with Article 500 . Revised to incorporate informational note into material group description.	SCR-8
506.5(C)	Revised to correlate with relevant materials standard and with Article 500 . Revised to incorporate informational note into material group description.	SCR-10
506.9(B)	Revised to correlate with how products are certified for use in Zone 20, 21, and 22 locations.	SR-3911
506.9(C)(2)	Revised exception to correct required information required on equipment marking and to include additional information for the marking example contained in the informational note.	SR-3910
506.9(E)(2)	Revised to clarify requirement applies only to enclosure with metric threaded openings and the associated metric threaded fittings or adapters.	FR-3931
506.9(F)	Revised to clarify requirement for sealing optical fiber cables with or without current-carrying conductors.	FR-3989
506.15(C)(10)	Added cablebus to wiring methods permitted in Zone 22 locations.	FR 3947
Article 511		
511.3(C)	Revised to tabularize area classification information for major and minor repair garages where heavier-than-air fuel is transferred or dispensed. Added informational note referencing Table 8.3.2 in NFPA 30A.	FR-3954
511.3(D)	Revised to tabularize area classification information for major repair garages where vehicles using lighter-than-air fuel are repaired or stored. Added informational note referencing Table 8.3.2 in NFPA 30A.	FR-3955
511.8	Added requirement on wiring methods installed under a commercial garage.	FR-3994
Article 513		
513.2	Relocated definitions used in more than one article to Article 100 .	FR-3926
Article 514		
514.3(B)(2) and Table 514.3(B)(2)	Revised area classification information where CNG, LNG, and LP-Gas are dispensed as motor fuels.	FR-4001
514.3(B)(3)	Added requirements on spacing separations where CNG, LNG, and LP-Gas are stored or dispensed.	FR-4002
514.8 Exception No. 2	Revised to permit Type HDPE conduit as an underground wiring method.	FR-3993
514.9	Revised to permit an explosionproof reducer at a seal fitting.	FR-3995
514.11	Revised requirements on emergency circuit disconnects for fuel dispensing and other electrically powered equipment at attended and unattended self-service motor fuel dispensing stations to correlate with NFPA 30A.	FR-3996

(continues)

Section	Comments	FR/SR/SCR Reference
Article 515		
515.3 and Table 515.3	Revised to update extract reference and the requirement referenced in Informational Note No. 2. Revised Table 515.3 by adding informational note with reference to associated requirement in NFPA 30.	SCR-11
Article 516		
Article 516	Revised to arrange requirements into five parts.	SR-3914
516.1	Revised to include “spraying” in scope of article. Added Informational Note No. 2 on extracted material.	SR-3914
516.2	Revised to delete terms not used in the requirements, to update extracted definitions, and to add new definitions of terms used in revised article.	SR-3914
516.3 (2014)	Deleted this section and incorporated requirements into appropriate locations in new article arrangement.	SR-3914
516.4	Revised to include only those area classification requirements applicable to “open containers.” Revised to update extracted material to reflect the requirements in the current edition date of the source standard.	SR-3914
516.5	Revised to include only those area classification requirements applicable to “spray application processes.” Revised to update extracted material to reflect the requirements in the current edition date of the source standard.	SR-3914
516.6	Revised to relocate requirements for wiring in Class I locations and to update extracted material to reflect the requirements in the current edition of the source standard.	SR-3914
Article 516, Part IV	Added requirements for hazardous (classified) location classification and control of ignition sources for spray application operations in temporary membrane enclosures.	SR-3914
Article 516, Part V	Relocated hazardous (classified) location classification requirements for coating and dipping processes.	SR-3914
Article 517		
517.2, Exposed Conductive Surfaces	Revised to move nonmandatory text to new informational note and to update the referenced section to correlate with NFPA 99.	SR 4212
517.2, Health Care Facilities	Revised to include “mobile enclosures” and “human” to correlate with NFPA 99 and to relocate examples to a new informational note.	FR-4238
517.2, Isolated Power System	Revised to include the referenced section to correlate with NFPA 99.	FR-4239
517.2, Isolation Transformer	Added the referenced section to correlate with NFPA 99 extracted material.	FR-4240
517.2, Invasive Procedure	Added definition that correlates with NFPA 99.	FR-4256
517.2, Life Safety Branch	Revised to update the referenced section to correlate with NFPA 99.	FR-4241
517.2, Governing Body	Added definition that correlates with NFPA 99.	FR-4255
517.2, Limited Care Facility	Revised to update the referenced section to correlate with NFPA 99.	FR-4242
517.2, Line Isolation Monitor	Revised to update the referenced section to correlate with NFPA 99.	FR-4243
517.2, Medical Office (Dental Office)	Added definition that correlates with NFPA 99.	FR-4244
517.2, Nursing Home	Revised to update the referenced section and standard from NFPA 99 to NFPA 101.	FR-4245
517.2, Patient Bed Location	Revised to update the referenced section to correlate with NFPA 99.	FR-4246
517.2, Patient Care Space	Revised to incorporate numbered health care category spaces to correlate with NFPA 99 and informational notes that provide examples.	SR-4215
517.2, Patient Care Vicinity	Revised to update the referenced section to correlate with NFPA 99.	FR-4248
517.2, Patient Equipment Grounding Point	Revised to update the referenced section to correlate with NFPA 99.	FR-4249
517.2, Reference Grounding Point	Revised to update the referenced section to correlate with NFPA 99.	FR-4250

Section	Comments	FR/SR/SCR Reference
517.2, Selected Receptacles	Added the referenced section to correlate with NFPA 99.	FR-4251
517.2, Task Illumination	Revised to update the referenced section to correlate with NFPA 99.	FR-4253
517.2, Total Hazard Current	Revised to update the referenced section to correlate with NFPA 99.	FR-4252
517.2, Wet Procedure Location	Added the referenced section to correlate with NFPA 99.	FR-4254
517.10(B), Informational Note	Revised to update the referenced section to correlate with NFPA 99.	FR-7513
517.13	Revised to replace "Areas" with "Spaces" to correlate with NFPA 99.	FR-4261
517.13(B)	Revised to specify the copper equipment grounding conductors must be insulated with green insulation and correlate with isolated ground receptacle requirements with 517.16.	SCR-16
517.16(A) and (B)	Revised to add isolated ground receptacle requirements with a new subdivision "(A)" for "Inside of Patient Care Vicinity" and "(B)" for "Outside of Patient Care Vicinity."	SR-4228
517.17	Revised to include "Category 1 spaces" to correlate with NFPA 99.	FR-4262
517.18	Revised to include Category 2 spaces to correlate with NFPA 99, and to provide the governing body the authority to designate similar risk level spaces.	FR-4266
517.19	Revised to include Category 1 spaces to correlate with NFPA 99.	FR-4267
517.19(A)	Revised to include distinctive color or marking for electrical receptacles or cover plates.	FR-4267
517.19(C)(1)	Revised to require a minimum of two branch circuits with at least 12 receptacles but no more than 24 on one of the required branch circuits.	FR-4267
517.19(C)(2)	Revised to correlate with receptacle combinations in NFPA 99.	FR-4267
517.19(E)	Revised to prohibit standard locknuts for bonding.	FR-4267
517.19(F)	Revised to include "Category 1 spaces" to correlate with NFPA 99.	FR-4267
517.21	Revised to include "Category 1 spaces" to correlate with NFPA 99.	FR-4264
517.29	Revised to relocate requirements from 517.30 to a new section titled "Essential Electrical Systems for Hospitals and Other Health Care Facilities."	FR-4271
517.29(A) and (B)	Revised to incorporate numbered health care category spaces to correlate with NFPA 99 extracted material, and to provide introductory information related to "essential electrical systems."	FR-4271
517.30	Revised to relocate requirements from 517.35 to 517.30 to provide a logical sequence.	FR-4276
517.30(B)(1) and (2)	Revised to relocate requirements from 517.35, to change the title to "Types of Power Sources," to clarify permitted configurations for generating units/external utility service, and to add new requirements for fuel cell systems.	FR-4276
517.30(C)	Revised to relocate requirements from 517.35(C) to provide a logical sequence and editorial revision.	FR-4276
517.31	Revised to relocate requirements from 517.30 to provide a logical sequence.	FR-4276
517.31(A)	Revised to require division between branches to occur at transfer switches where more than one transfer switch is required.	FR-4276
517.31(C)(3)(e) and (f)	Revised to include two additional conditions where flexible metal raceways and metal sheathed cable assemblies are permitted.	FR-4276
517.32	Revised to relocate requirements from 517.31 and to correlate language extracted from NFPA 99.	FR-4272
517.33	Revised to relocate requirements from 517.32 and to correlate language extracted from NFPA 99.	FR-4273
517.34	Revised to relocate requirements from 517.33 and to incorporate numbered health care category spaces to correlate with NFPA 99.	FR-4274
517.34(B)	Added subdivision that permits controlling of task illumination on the critical branch.	FR-4274
517.35	Revised to relocate requirements from 517.34.	FR-4275
517.40	Revised the title to include essential electrical system "Type 2." Added informational note to incorporate numbered health care category spaces to correlate with NFPA 99 and to provide guidance on category space application and recognition that care used in these facilities necessitates compliance with 517.40 and 517.41, unless care is comparable to a hospital.	FR-4268

(continues)

Section	Comments	FR/SR/SCR Reference
517.40(B)	Added new Informational Note No. 2 to provide guidance on application of other requirements for emergency egress and loadshed conditions where optional loads are connected.	FR-4268
517.41(A) and (B)	Revised to relocate requirements from 517.44 and to correlate language extracted from NFPA 99.	FR-4279
517.41(C)	Revised to relocate requirements from 517.44, correlate language extracted from NFPA 99, delete the informational note, and relocate physical separation requirements from the informational note into mandatory language.	FR-4279
517.42	Revised to relocate requirements from 517.41.	FR-4277
517.42(A)	Revised to require division between branches to occur at transfer switches where more than one transfer switch is required. Added Informational Note No. 2 referring to NFPA 99.	SR-4219
517.42(B)	Revised to update the referenced section to correlate with NFPA 99 extracted material.	SR-4220
517.42(B) Informational Note Figures 517.42(a) and (b)	Revised to remove references to the critical branch.	SR-4220
517.42(D)	Revised to add “equipment branch,” remove references to the critical branch, and add an informational note referencing NFPA 99.	FR-4277
517.42(E)	Revised to include distinctive color or marking for electrical receptacles or cover plates and replace “essential electrical system” with “life safety or equipment branches.” Added informational note recommending the same color marking throughout the facility.	FR-4277
517.43(A), (B), and (C)	Revised to relocate requirements from 517.42.	FR-4270
517.43(D)	Revised to add reference section of extracted material.	FR-4270
517.43(E)	Revised to add reference section of extracted material and requirement for minimum of 5 ft-candles.	FR-4270
517.43(F)	Revised to add reference section of extracted material.	FR-4270
517.43(G)	Revised to update reference section of extracted material.	FR-4270
517.44	Revised to relocate requirements from 517.43, replace all references to “critical branch” with “equipment branch,” and add reference section of extracted material.	FR-4278
517.44(A)	Revised to correlate with NFPA 99.	SR-4229
517.45(A)	Revised to correlate with the new definition of <i>governing body</i> and incorporate numbered health care Category 3 space and requirements for alternate power systems to correlate with NFPA 99.	FR-4280
517.45(C)	Revised to incorporate numbered health care category spaces to correlate with NFPA 99.	FR-4280
517.45(D)	Added subdivision for “General Care Patient Care Areas” and requirements for the essential electrical distribution system.	FR-4280
517.45(E)	Revised to require alternate power sources to comply with the requirements of NFPA 99.	FR-4280
517.80	Revised to replace “Areas” with “Spaces” to correlate with NFPA 99.	FR-4206
517.160(B)(1)	Revised to require line isolation monitors to be listed.	FR-4207
Article 520		
520.2, Adapter	Added definition to address various configurations for attachment plugs or receptacles.	FR-4212
520.2, Stage Switchboard	Revised to add “permanently installed” to clarify the definition does not include portable.	FR-4213
520.2, Stage Switchboard, Portable	Added definition to clarify the difference between a portable or permanently installed stage switchboard.	FR-4214
520.2, Two-Fer	Revised to correlate with the new definition of <i>adapter</i> .	SR-4227
520.9	Revised to add a reference to 210.23 and exemption from 210.8(B)(4).	SCR-13
Table 520.44(C)(3)(a)	Revised to add a separate table for ampacity adjustment where load diversity factor is 50 percent minimum.	FR-4210
520.49	Revised to remove the requirement for the device to be located in the loft above the scenery with a tight, self-closing door but require door to remain closed except during servicing.	FR-4216

Section	Comments	FR/SR/SCR Reference
520.51	Revised to replace “conductor derating” with “ampacity adjustment.”	FR-4215
520.53	Revised to relocate requirements for feeders to new 520.54 and to update the portable stage switchboard construction requirements. Added requirements for portable stage switchboards to be listed.	FR-4281
520.54	Relocated the requirements for feeders to new section and revised for clarity.	FR-4281
520.62(F)	Added subdivision for installation requirements of single-conductor feeders.	FR-4218
520.68(A)(3)	Revised to increase the maximum length from 1.0 m to 2.0 m (3.3 ft to 6.6 ft).	FR-4220
520.68(B)	Revised to require load diversity to be 50 percent or less when ampacity adjustment factors are applied.	SR-4207
520.68(C)	Added subdivision to require compliance with 240.5 for overcurrent protection of conductors.	FR-4219
520.(C)	Revised to increase the maximum length from 1.0 m to 2.0 m (3.3 ft to 6.6 ft).	FR-4221
Article 520, Part VI	Revised title to include dressing areas and makeup areas.	SR-4226
520.71	Revised to add makeup to the types of rooms where pendant lampholders are not permitted.	FR-4223
520.72	Revised to add makeup areas, delete “incandescent,” and include all types of light sources to be equipped with guards, excluding recessed lamps.	FR-4223
520.73	Revised to replace “lights” with “luminaires, lampholders,” add makeup counters or rooms, and relocate the requirements for pilot lights to new 520.74.	FR-4223
520.74	Relocated pilot light requirements from 520.73 to this section. Added new requirement for protecting from physical damage, permanent identification requirements, and lamp type.	FR-4222
Article 522		
Table 522.22	Revised to update the referenced table for temperature correction factors.	FR-4224
522.25	Revised to increase the voltage threshold from 50 volts to 60 volts.	SR-7508
Article 525		
525.23(D)	Added subdivision to require that portable GFCI receptacles on branch circuits fed by a flexible cord be listed, labeled and identified for portable use.	SCR-120
Article 530		
530.23	Revised to add a reference exemption from 210.8(B)(4).	SCR-15
Article 547		
547.5(F)	Revised to remove “covered.” Added informational note referencing 250.120(B) for aluminum and copper-clad aluminum conductors.	FR-5442
547.5(G)	Revised to remove “general purpose” to provide GFCI protection for all receptacles.	FR-5443
Article 550		
550.2, Manufactured Home	Revised to correlate with the definition in NFPA 501.	SR-5406
550.13(B)	Revised text to a list format for clarity and to expand GFCI protection for dishwasher outlets and receptacles within 1.8 m (6 ft) of all sinks.	SR-5414
550.15(H)	Revised to a list format for clarity and to require conduit or raceway to be identified for use in wet locations.	SR-5407
550.25(B)	Revised to require all 120-volt branch circuits that supply 15- and 20-ampere outlets to comply with 210.12.	SR-5403
Article 551		
551.2, Recreational Vehicle Park	Revised to correlate with the definition in NFPA 1194.	FR-5407
551.2, Recreational Vehicle Site	Revised to correlate with the definition in NFPA 1194.	FR-5408
551.43(C)	Revised to clarify that a single 15-amp receptacle cannot be protected with a 20-amp overcurrent device.	FR-5450
551.71	Revised to create subdivisions for clarity.	SR-5408

(continues)

Section	Comments	FR/SR/SCR Reference
551.71(A)	Added subdivision for 20-ampere receptacle. Revised to add “recreational vehicle site supply equipment.”	SR-5408
551.71(B)	Added subdivision for 30-ampere receptacle requirements.	SR-5408
551.71(C)	Added subdivision for 50-ampere receptacle requirements. Revised to require a minimum of 20 percent for existing sites and 40 percent for new installations.	SR-5408
551.71(D)	Added subdivision for tent site requirements.	SR-5408
551.71(E)	Added subdivision for additional receptacles.	SR-5408
551.71(F)	Added subdivision for GFCI requirements. Revised to exempt RV site electrical equipment from the tamper- or weather-resistant requirements.	SR-5408
551.72	Revised to create subdivisions for clarity.	FR-5412
551.72(A)	Added subdivision that includes requirements for single phase systems. Revised to include 120/208 volt systems and relocate the requirements in 551.73(D).	FR-5412
551.72(B)	Added subdivision that includes requirements for three phase systems.	FR-5412
551.72(C)	Added subdivision that includes requirements for receptacles.	SCR-18
551.72(D)	Added subdivision that includes requirements for neutral conductors. Relocated the informational note from 551.73(D) to Informational Note No. 1. Added Informational Note No. 2 to clarify RV site supply circuits are not continuous loads.	SCR-18
551.73(A)	Revised to increase the “9600” to “12,000” volt-amperes for sites equipped with 50-ampere supply facilities.	FR-5413
551.75	Revised to create subdivisions.	FR-5414
551.75(B)	Added subdivision to specify that a grounding electrode is only required for recreational vehicle site supply equipment used as service equipment.	FR-5414
Article 552		
552.5	Added section that provides requirements for labels.	FR-5415
552.41(B)(1) and (3)	Revised to require a minimum depth for a countertop	FR-5418
552.4 (F)(2)	Revised to include “or other similar horizontal surface”	FR-5419
552.42	Added section addressing overcurrent protection requirements for branch circuits.	FR-5420
552.43(C)(2)	Revised to clarify liquidtight flexible conduit permissions and remove language already covered elsewhere in the <i>NEC</i> .	FR-5421
552.44(D)	Revised to simplify the label requirements and add additional warning information.	FR-5416
552.44(E)	Revised to simplify the location of the power supply assembly.	FR-5422
552.45(B) Exception	Revised to prevent storage of material in front of the panelboard.	FR-5423
552.46(A)	Revised to include 120/240 volt system.	FR-5424
552.46(A) Exception No. 2	Added exception to permit a sixth circuit without employing an emergency management system, provided the load calculation does not exceed the load of the original five circuits.	FR-5424
552.48(H)	Revised to require cables be secured in addition to supported.	FR-5425
552.48(I)	Revised to require cables be secured in addition to supported, and to relocate the exception into the positive <i>Code</i> rule.	FR-5426
552.48(O)(1)	Revised to create a new subdivision with list items for cord-and-plug connected expandable units.	SR-5404
552.48(O)(2)	Added subdivision with list items for direct wire connected expandable units.	SR-5404
552.48(P)(3)	Revised to simplify the label requirements and add additional warning information.	FR-5427
552.48(Q)	Added section to address pre-wiring installed for other appliances or devices.	FR-5428
552.52(C)	Added subdivision prohibiting switches to be installed in tub or shower spaces unless part of a listed assembly.	FR-5430
552.54(A)	Revised to add ceiling suspended paddle fans to the requirement.	FR-5431

Section	Comments	FR/SR/SCR Reference
552.48(I)	Revised to require cables be secured in addition to supported, and to relocate the exception into the positive Code rule.	FR-5426
552.48(O)(1)	Revised to create a new subdivision with list items for cord-and-plug connected expandable units.	SR-5404
552.48(O)(2)	Added subdivision with list items for direct wire connected expandable units.	SR-5404
552.48(P)(3)	Revised to simplify the label requirements and add additional warning information.	FR-5427
552.48(Q)	Added section to address pre-wiring installed for other appliances or devices.	FR-5428
552.52(C)	Added subdivision prohibiting switches to be installed in tub or shower spaces unless part of a listed assembly.	FR-5430
552.54(A)	Revised to add ceiling suspended paddle fans to the requirement.	FR-5431
552.54(B)	Revised to relocate the prohibition of switches to be installed in tub or shower spaces to new 552.52(C).	FR-5431
552.59(B)	Revised to simplify the label requirements and add additional warning information.	FR-5417
Article 555		
555 Title	Revised to add commercial and noncommercial docking facilities.	SR-5412
555.1	Revised to add one-family dwellings, two-family dwellings, and multifamily dwellings.	FR-5435
555.3	Revised to add boatyards and commercial and noncommercial docking facilities and lowering the ground-fault protection threshold to a maximum 30 mA.	SR-5413
555.19(A)(4)	Revised to include higher rated pin and sleeve devices.	FR-5439
555.15(B)(1)	Revised to delete “where portable electrical hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used.”	FR-5440
555.24	Added section requiring permanent safety signs to be installed to give notice of electrical shock hazard risks to persons using or swimming near a boat dock or marina.	SCR-20
Article 590		
590.4(B)	Revised text to a list format for clarity. Added Type SE cable as a permitted wiring method to be installed in a raceway underground	FR 615
590.4(G)	Revised text to a list format for clarity.	SR-606
590.5	Revised to require listed decorative lighting to be labeled on the product.	FR-617
590.6(A)(1)	Revised to prohibit listed cord sets or devices incorporating listed GFCI from being used in lieu of GFCI-protected receptacle outlets.	FR-618
590.6(B)(2)	Added list item permitting special purpose ground-fault circuit-interrupter protection for personnel.	SR-608
Article 600		
600.1	Revised to include retrofit kits with the other types of equipment covered by the requirements of Article 600.	SR-5119
600.2	Added definition of <i>photovoltaic powered sign</i> .	FR-5133
600.3	Revised to include “photovoltaic powered signs” with the other types of equipment required to be listed.	FR-5134
600.4(B)	Revised to include requirements for marking signs with a retrofitted illumination system or with retrofitted lamps that are powered through existing sign sockets.	SR-5120
600.6(A)	Revised to clarify that the location of the sign disconnecting means can be as specified in (A)(1), (A)(2), or (A)(3).	FR-5137
600.6(A)(1)	Revised to include “sign body” as an enclosure that supply conductors enter.	SCR-46
600.6(A)(1) Exception No. 1	Revised to add metal-jacketed cables identified for the location as a wiring method to protect and isolate branch circuit and feeder conductors installed within the interior of a sign.	SCR-46
600.6(A)(1) Exception No. 2	Added exception for branch circuit or feeder conductors installed within a sign body or enclosure to supply a panelboard located within the interior of a sign enclosure or sign body.	SCR-46

(continues)

Section	Comments	FR/SR/SCR Reference
600.6(A)(2)	Revised to require signs be provided with field-applied marking to indicate location of supply circuit disconnecting means.	FR-5137
600.6(A)(3)	Added exception requiring marking of sign controllers to indicate location of supply circuit disconnecting means where it is not installed <i>within sight</i> of the controller.	FR-5137
600.12	Revised to also apply to photovoltaic (PV) powered signs.	FR-5138
600.12(C)(2)	Revised to reference new Tables 600.33(A)(1) and (A)(2) .	SR-5125
600.24	Revised to clarify that requirements apply to the power supplies rather than the equipment/systems supplied.	FR-5142
600.24(B)	Revised to clarify that metal parts of Class 2 power supplies/sources are to be connected to the EGC of the supply (line side) branch circuit.	FR-5142
600.24(D)	Revised to clarify that the requirement applies to the conductors on the load (secondary) side of the Class 2 power source.	FR-5142
600.33	Revised title to clarify that requirements apply to any type of lighting system supplied by Class 2 circuits.	FR-5139
600.33(A)(1) and (A)(2)	Revised to increase minimum Class 2 circuit conductor size and to add new tables prescribing permitted types of Class 2 cables and acceptable substitutions based on location of installation.	SR-5124
600.33(A)(3)	Revised to require cables installed in wet locations be listed and marked for the application.	FR-5139
600.33(A)(4)	Added requirement for cables installed outdoors and exposed to sunlight to be listed and marked for the application.	FR-5139
600.33(B)	Revised to provide maximum interval for cable support and securement.	SR-5123
600.34(A) through (F)	Added requirements covering the installation and field wiring of photovoltaic (PV) powered signs.	FR-5145
Article 604		
604.6	Added section requiring listing.	FR5449
604.10	Relocated from 604.4 for uses permitted.	FR5447
604.12	Relocated from 604.5 for uses not permitted	FR5448
604.100	Relocated from 604.6 for construction requirements.	FR5449
Article 605		
605.6	Revised to require lighting equipment be labeled.	FR-5130
605.9	Revised to apply the limitation to receptacles rather than receptacle outlets.	FR-5131
Article 610		
610.2	Deleted informational note containing description and temperature and voltage ratings of festoon cables.	FR-3301
610.32	Revised to require means to disconnect crane or hoist motor power from operating station.	FR-3302
610.42(B)(3) (2014)	Deleted condition permitting tap conductors without separate overload protection for brake coil operation.	FR-3303
610.43(A)(3)	Revised requirements on the use of thermal sensing elements for crane branch circuit and motor overload protection.	FR-3304
610.55 (2014)	Deleted requirement on crane operation/functionality that is more appropriately covered in other industry standards.	FR-3305
Article 620		
620.5(B)	Revised to establish ac and dc voltage levels at which guarding of live parts is required for equipment that will be worked on while energized.	SCR-80
620.11 Informational Note	Revised to clarify material contained in the informational note.	FR-3329
620.11(A)	Revised to allow conductors to be protected by using either flame-retardant cable/conductors or an approved method of physical protection that affords flame retardancy for the cable/conductors.	SR-3329

Section	Comments	FR/SR/SCR Reference
620.16(A)	Added requirement for elevator control panels to be marked with their short-circuit current rating.	SR-3330
620.16(B)	Added requirement to prohibit elevator control panels from being installed where available short-circuit current exceeds the marked rating.	SR-3330
620.21(A)(1)(a)	Revised to expand permitted applications for Class 2 circuit cables in hoistways and pits.	FR-3385
620.21(A)(1), (2), and (3)	Revised to remove 1.8 m (6 ft) limitation on flexible cords and cables in hoistways and pits, on cars, and in machinery/control rooms and spaces.	FR-3385
620.23(A)	Revised to clarify the minimum number of circuits required for lighting and receptacles in machinery/control rooms and spaces.	SR-3331
620.24(A)	Revised to clarify the minimum number of circuits required for lighting and receptacles in the hoistway pit.	SCR-72
620.24(C) Informational Notes	Added informational note referencing 620.85 for GFCI protection requirements.	FR-3388 & SCR-72
620.37(B)	Revised to correlate with terminology on lightning protection “down conductors” used in NFPA 780	FR-3389
620.42	Revised to provide correct Chapter 5 references.	FR-3390
620.51	Revised to clarify the types of equipment subject to the disconnecting means requirement.	FR-3391
620.51(C)(1)	Revised the requirements covering access to and location of disconnecting means for motor controllers located in hoistways.	FR-3392
620.51(D)(2)	Added requirement to mark elevator control panels with maximum available fault current and for updating the marking to reflect changes in the electrical system that impact the available fault current level at the control panel location.	SR-3334
620.51(E)	Added requirement for surge protection of equipment designated as an emergency load.	FR-3395
620.85	Revised to provide more comprehensive coverage of the areas associated with elevators that require GFCI protection of 125-volt, 15- and 20-ampere receptacles.	FR-3394
Article 625		
625.1	Revised to include wireless charging technology to the equipment types covered in Article 625.	SCR-73
625.2, Cable Management System	Revised to include cables supplying wireless power transfer equipment.	FR-3363
625.2, Charger Power Converter	Added definition associated with wireless power transfer systems.	FR-3361
625.2, Fastened in Place	Added definition related to certain types of EVSE.	FR-3360
625.2, Fixed in Place	Added definition related to certain types of EVSE.	FR-3360
625.2, Output Cable to Primary Pad	Added definition associated with wireless power transfer systems.	FR-3411
625.2, Portable (as applied to EVSE)	Added definition related to certain types of EVSE.	SR-3339
625.2, Primary Pad	Added definition of a wireless power transfer system component.	FR-3412
625.2, Wireless Power Transfer	Added definition of electric vehicle charging methodology.	FR-3413
625.2, Wireless Power Transfer Equipment	Added definition describing two types of power transfer equipment associated with a wireless power transfer system.	SR-3340
625.4	Revised to increase the maximum ac and dc system voltages to 1000 volts.	FR-3364
625.5	Revised to require that wireless power transfer equipment be listed.	SR-3341 and Global SCR-119
625.10	Revised to delete requirements that are a function of product construction/safety standards and do not lend themselves to practical enforcement in the field.	FR-3366
625.15(A) through (C)	Revised to expand applicability to wireless power transfer equipment.	FR-3367

(continues)

Section	Comments	FR/SR/SCR Reference
625.16	Revised to expand applicability to wireless power transfer equipment.	FR-3368
625.19	Revised based on inclusion of new definition for <i>portable equipment</i> in 625.2 and the corresponding changes made to equipment rating requirements in 625.44(A).	FR-3380
625.22	Revised excluding equipment rated less than 60 volts dc.	SR-3343
625.40	Added requirement specifying that outlets for electric vehicle charging be supplied by an "individual branch circuit."	FR-3371
625.41	Relocated requirements on overcurrent protection. Revised to expand applicability to wireless power transfer equipment.	FR-3372
625.42	Relocated requirements on charging equipment ratings. Revised to expand applicability to wireless power transfer equipment.	FR-3373
625.43	Relocated requirements on disconnecting means. Revised to expand applicability to wireless power transfer equipment.	FR-3374
625.44	Revised to expand applicability to wireless power transfer equipment.	FR-3379
625.44(A)	Revised to correlate with new definition of <i>portable</i> , to provide dc receptacle configuration and ampere ratings, to increase voltage rating of dc receptacles supplying EVSE, and to provide a requirement on supply cord length.	SR-3345
625.44(B)	Revised to correlate with new definition of <i>stationary</i> , to add a three-phase receptacle configuration, and to provide a requirement on supply cord length.	SR-3344
625.44(C)	Revised to correlate with new definition of <i>fixed</i> .	SR-3346
625.47	Added requirement covering charging equipment supplied by multiple circuits.	SR-3347
625.48	Revised to update requirement for compatibility with current technology for delivery of energy to and from an EV and to add a new informational note.	FR-3376
625.50	Revised to exclude portable EVSE from mounting location requirements.	FR-3381
625.52(A) and (B)	Revised to expand applicability to wireless power transfer equipment.	FR-3377
Article 625, Part IV	Added requirements covering the installation and field wiring of wireless power transfer equipment.	SCR-75
Article 626		
626.31(C)	Revised to include 1000-volt-rated receptacle configuration.	FR-3382
626.32(A)	Revised to include 1000-volt-rated power supply cable assemblies.	FR-3383
626.32(C)	Revised to include 1000-volt-rated attachment plug and cord connector.	FR-3384
Article 630		
630.6	Added requirement for listing of equipment covered by Article 630.	SR-3302
630.31	Revised to relocate text related to circuit performance to new informational note.	FR-3332
Article 640		
640.2, Technical Power System	Revised for technical accuracy.	FR-3308
640.3(B)	Revised to distinguish between ducts and other spaces used for environmental air and to add two exceptions referencing requirements in Article 725.	SR-3304
640.3(C)	Revised to correlate with equipment covered by the scope of Article 392.	SR-3310
640.3(M)	Revised to correlate cross-reference with revisions made in Article 650.	FR-3327
640.6(A) (2014)	Deleted requirement redundant to 110.12.	FR-3311
640.21(C)	Added informational note.	FR-3312
640.22	Revised to include requirement for bonding of metal equipment racks and enclosures and to delete text redundant to 110.12.	FR-3313
640.25	Revised to require marking of speaker assemblies for use in fire resistance-rated assemblies and to remove reference to withdrawn standard in the informational note.	SR-3305

Section	Comments	FR/SR/SCR Reference
640.42(B) and (C)	Revised to correct terminology associated with optical fiber cables.	FRs-3315 & 3316
640.43	Revised to include requirement for bonding of metal equipment racks and to delete text redundant to 110.12.	FR-3317
Article 645		
645.2, Informational Technology Equipment	Relocated definition used in more than one article to Article 100.	FR-3340
645.3	Revised to correct reference.	SR-3308
645.3(B)	Revised to improve usability and to correct cross-references.	SR-3309
645.3(C)	Revised to expand requirement to include bonding of equipment.	SR-3310
645.3(D)	Revised to correct cross-reference.	FR-3343
645.3(E)	Revised to require use of only listed cables and equipment.	FR-3344
645.3(F)	Revised to require use of only listed cable routing assemblies and equipment.	FR-3345
645.3(G)	Revised to require use of only listed cables and equipment.	FR-3346
645.3(H)	Added requirement on use of optical fiber cables in ITE rooms.	FR-3347
645.3(I)	Relocated requirement from 645.6.	FR-3350
645.4	Revised to clarify intended application of Article 645.	SR-3311
645.5(E)	Revised to improve usability and to correlate with the requirements in 645.3 for fire alarm and coaxial cables.	SR-3312
645.5(F)	Revised to limit unsupported cables to underfloor installation only. Added informational note.	SCR-81
645.6 (2014)	Relocated to 645.3(I).	FR-3350
645.10(B)	Revised how information can be conveyed to first responders. Added table of cross-references for underfloor wiring.	SR-3315
645.18	Added requirement for surge protection of equipment supplying power to critical operations data systems that correlates with surge protection requirements in Article 708 for critical operations power systems.	FR-3356
Article 646		
646.2, Modular Data Center	Revised upper voltage rating of MDCs and clarified applicability of referenced product standards.	FR-3398
646.3(B)	Revised to improve usability, to clarify requirement applies to "other spaces used for environmental air," and to correct cross-references.	SR-3321
646.3(D)	Revised to correct cross-reference.	FR-3399
646.3(E)	Revised to clarify that only listed cable and equipment can be used in an MDC.	FR-3400
646.3(F)	Revised to clarify that all equipment, cables, raceways, and cable routing assemblies are required to be listed.	SR-3322
646.3(G)	Revised to clarify that only listed cable and equipment can be used in an MDC.	FR-3402
646.3(L)	Revised to add reference to 645.4 in (L)(3) and to delete text in (L)(6) and (7) (2014) because it is covered elsewhere in 646.3.	FR-3404
646.7(B) Exception and Informational Note No. 1	Revised to create new exception based on statement from Informational Note No. 2 (2014).	SR-3324
646.13	Revised to include "information technology equipment" to the types of equipment enumerated.	SR-3326
646.20(B) Informational Notes	Revised for consistency with the 1000-volt threshold used elsewhere in the NEC.	FR-3408
646.21	Revised for consistency with similar requirement in Article 480 and to add other types of battery supports.	FR-3409
Article 647		
647.30	Revised terminology associated with conductors supplying sensitive electronic equipment.	FR-3352

(continues)

Section	Comments	FR/SR/SCR Reference
Article 650		
650.1	Revised scope to clarify types of circuits covered in Article 650 . Added informational note.	FR-3318
650.2	Added section with definitions for <i>electronic organ</i> , <i>pipe organ</i> , and <i>sounding apparatus</i> .	FR-3319
650.3	Revised to clarify relationship between Article 650 and Chapters 1 through 7 .	FR-3320
650.4	Revised to specify the dc power supply be listed. Added informational note on typical characteristic of organ power supplies.	FR-3321
650.5	Revised to require double insulation of power supplies and bonding of metal enclosures containing power supplies.	FR-3322
650.7	Revised methods for conductor splicing, support of internal wiring, and tags for abandoned internal wiring.	FR-3324
650.8	Revised maximum overcurrent protection for conductor sizes 20 AWG through 28 AWG.	FR-3325
650.9	Added requirement and associated informational note on isolating conductive parts to preclude accidental contact.	FR-3326
Article 660		
660.5	Revised location of and access to disconnecting means with new exceptions permitting alternative approaches.	FR-3333
Article 669		
669.6 A) and (B)	Revised dc voltage that triggers requirements for insulated supports and protection against accidental contact.	SR-3319
Article 670		
670.1	Revised to correlate with upper voltage rating for insulated conductors covered in Tables 310.15(B)(16) through 310.15(B)(20) .	FR-3335
670.5	Revised to amend “fault current” to “short-circuit current” and to add short-circuit current field marking requirement.	SR-3336
670.6	Added requirement for surge protection of equipment having safety interlock circuits	FR-3357
Article 680		
680.2, Electrically Powered Pool Lift	Added definition to correlate with requirements for this type of equipment in new Part VIII of Article 680 .	FR-4860
680.2, Storable Swimming, Wading, or Immersion Pools; or Storable/Portable Spas and Hot Tubs	Revised to clarify location of pools, spas, or hot tubs with nonmetallic polymeric or inflatable walls covered by this definition.	FR-4873
680.3 (2014)	Deleted cross-reference requirement covered by 90.3 .	FR-4850
680.4	Revised to require listing of products and equipment associated with swimming pool installations.	SR-4815
680.7	Added requirement on environmental exposure certification and materials for grounding and bonding termination and connection hardware.	SR-4816
680.7 through 680.12 (2014)	Revised to renumber sections as 680.8 through 680.13 .	FR-3883
680.11	Revised wiring methods, cover requirements, and allowable function for underground wiring installed near or under swimming pools.	FR-4853
680.12	Revised requirement and added informational note related to corrosive environments typical to most equipment rooms and pits containing equipment associated with pools, spas, hot tubs, and similar bodies of water.	FR-4854
680.14(A) and (B)	Added requirement specifying conditions under which an area is considered to be a corrosive environment and for certification/identification of the wiring methods used in such locations.	SCR-43
680.21(A)(1)	Revised to establish requirements for installations in corrosive and in noncorrosive environments.	SR-4818

Section	Comments	FR/SR/SCR Reference
680.21(A)(2) (2014)	Deleted requirement because it does not address a condition unique to the locations covered by Article 680 and is covered by general rules of Chapter 3.	SR-4818
680.21(A)(2)	Revised to require listed fittings.	SR-4818
680.21(A)(3) (2014)	Deleted requirement because it does not address a condition unique to the locations covered by Article 680 and is covered by general rules of Chapter 3.	SR-4818
680.22(A)(2)	Revised distance and device type requirements for receptacles supplying circulating pumps and other similar function equipment.	FR-4856
680.22(B)(7)	Added requirement covering gas-fired equipment with low-voltage ignition systems.	SR-4819
680.23(A)(2)	Revised to require equipment to be “labeled” and “identified” in addition to “listed.”	SR-4820
680.23(A)(3)	Revised to require GFCI protection for personnel performing any maintenance/service activity associated with underwater luminaires operating above the “low-voltage contact limit.”	FR-4858
680.23(F)(1)	Revised to separate requirements for installations in corrosive environments from those in noncorrosive environments and to add “power supplies” for pool lights in the exception.	FR-4862 and SCR-41
680.23(F)(3)(2)	Revised to use correct term for the conductor used to ground equipment and to include bonding jumpers required in nonmetallic raceways connected to underwater luminaires.	FR-4861
680.24(A)(1)	Revised to require equipment to be “labeled” and “identified” in addition to “listed.”	SR-4821
680.25(A)	Revised to separate requirements for installations in corrosive environments from those in noncorrosive environments and to incorporate grounding requirements unique to Article 680 installations formerly located in 680.25(B).	SR-4829
680.25(B) (2014)	Revised to relocate grounding requirement unique to Article 680 installations and to delete requirements covered elsewhere in the NEC.	FR-4864
680.26(B)(2)	Revised to clarify extent of perimeter surface area covered by bonding requirement.	FR-4865
680.27(A)(2)	Revised to remove restriction on installing only one type of LFNC.	FR-4866
680.27(B)(1) and (2)	Revised to add exceptions recognizing availability of listed pool cover systems operating at or below the “low-voltage contact limit” and to delete informational notes referencing bas c requirements on equipment installed in wet or damp environments.	FR-4867
680.28	Added requirement covering protection of circuits supplying electrical components operating above the low-voltage contact limit that are associated with gas-fired water heaters for pools, spas, and similar bodies of water.	FR-4869
680.41	Revised to align with term defined in Article 100.	FR-4867
680.42(B)(1)	Revised to require equipment to be “labeled” and “identified” in addition to “listed.”	SR-4823
680.42(C)	Revised to limit application of requirement to interior branch circuits only. Added informational note referencing 680.25 for feeder requirements.	FR-4868
680.43(D)(2)	Revised to require equipment to be “labeled” and “identified” in addition to “listed.”	SR-4825
680.44(A)	Revised to require equipment to be “labeled” and “identified” in addition to “listed.”	SR-4826
680.62(A)(1)	Revised to require equipment to be “labeled” and “identified” in addition to “listed.”	SR-4827
680.74	Revised to restructure requirement to improve usability, to clarify those items not required to be bonded, and to include blower motors that are part of a hydromassage bathtub assembly.	FR-4870
680.81 through 680.85	Added series of requirements covering the certification, marking, protection, and field installation of “electrically powered pool lifts.”	SR-4830
Article 682		
682.2	Revised to expand GFCI protection for personnel to all receptacles of the specified rating and configuration installed within the datum plane.	FR-4871
Article 685		
Table 685.3	Revised to update Article 430 reference and to expand 705.12 reference to include entire section.	FR-3337

(continues)

Section	Comments	FR/SR/SCR Reference
Article 690		
690.1	Revised to correlate with new Article 691 and to clarify that energy storage systems and loads supplied by the PV system output are not within the scope of Article 690 . Revised associated figures.	SR-928
690.2, Array	Revised to include arrays producing alternating current.	FR-950
690.2, Bipolar Photovoltaic Array	Revised to clarify this type of array produces only direct current.	FR-958
690.2, Blocking Diode (2014)	Deleted definition because it is no longer used in Article 690 .	FR-951
690.2, Building Integrated Photovoltaics (2014)	Deleted definition because it is no longer used in Article 690 .	FR-951
690.2, DC-to-DC Converter Output Circuit	Added definition for term introduced into 2017 Article 690 requirements.	FR-952
690.2, DC-to-DC Converter Source Circuit	Added definition for term introduced into 2017 Article 690 requirements.	FR-952
690.2, Functional Grounded PV System	Added definition to distinguish PV systems having a reference potential to ground from those that are solidly grounded.	SR-932
690.2, Generating Capacity	Added definition for term introduced into 2017 Article 690 requirements.	FR-1002
690.2, Interactive System	Revised to delete redundant term and to remove language describing energy storage systems based on inclusion of new Article 706 .	FR-959
690.2, Interactive Inverter Output Circuit	Added definition to distinguish interactive inverter output conductors from feeder and service conductors.	FR-953
690.2, Inverter Input Circuit	Revised to remove detail that could unnecessarily constrain connection configurations.	FR-960
690.2, Inverter Output Circuit	Revised to remove detail that could unnecessarily constrain connection configurations.	FR-960
690.2, Multimode Inverter	Revised to recognize that interactive connections are not made exclusively to utility sources.	FR-961
690.2, Photovoltaic System DC Circuit	Added definition used in general requirements covering all dc conductors of a PV system.	FR-952
690.2, Photovoltaic System Voltage (2014)	Deleted definition to correlate with other revisions that specify applicability to dc systems, ac systems, or both.	SR-931
690.3 (2014)	Deleted requirement deemed unnecessary based on proper use of code structure per 90.3 .	FR-956
690.4(B)	Revised to include field labeling as an equipment certification option.	FR-957, SR-933
690.4(D)	Revised to permit multiple PV systems to be installed in or on a building or structure and the requisite directory at each system disconnecting means where the systems are located remotely from each other.	FR-963
690.4(E)	Added requirement on prohibited location of PV equipment and PV system disconnecting means.	FR-962
690.5 (2014)	Relocated to 690.41 .	FR-991
690.6(C) (2014)	Deleted requirement because rules for ac and dc circuit disconnecting means are adequately covered in Part III of Article 690 .	FR-964
690.6(D) (2014)	Deleted outdated text that did not establish requirement unique to ac modules.	FR-964
690.7	Revised first paragraph to provide description of maximum PV system dc circuit voltage, establish maximum dc circuit voltages based on occupancy type, and exempt PV dc equipment rated 1500 volts or less from Parts II and III of Article 490 .	FR-1020, SCR-62
690.7(A)	Revised to simplify existing requirements for calculating maximum system voltage of dc PV source and output circuits. Added new option with associated informational note for calculating maximum system voltages where generating capacity is 100 kW or more.	FR-1020, SCR-63
690.7(B) (2014)	Deleted requirement referencing Article 210 per 90.3 .	FR-1020, SCR-63
690.7(B)	Added requirement on calculating maximum voltages for dc-to-dc converter source and output circuits.	FR-1020, SCR-64

Section	Comments	FR/SR/SCR Reference
690.7(C) (2014)	Relocated to first paragraph of 690.7.	FR-1020
690.7(C)	Relocated from 690.7(E) of 2014 edition. Revised conditions under which maximum bipolar source and output circuit voltage is determined. Revised the condition on circuit conductor grounding to specify other than solidly grounded connections and to include the text that was formerly expressed as an exception.	FR-1020, SR-938
690.7(D) (2014)	Deleted requirement that is not unique to PV systems and is adequately covered by 110.27.	FR-1020
690.7(E) (2014)	Revised and relocated to 690.7(C).	FR-1020
690.8(A)(1)	Revised to provide alternative method and associated informational note covering engineering supervision of source circuit current calculations for systems having a generating capacity of 100 kW or more.	SCR-65
690.8(A)(5)	Revised to amend applicability from dc-to-dc converter output circuits to dc-to-dc converter source circuits.	FR-968
690.8(A)(6)	Added requirement for determining dc-to-dc converter output circuit current.	FR-968
690.8(B)	Revised to include adjustable electronic overcurrent protective devices.	SCR-66
690.9(A)	Revised to clarify application of overcurrent protection to PV system conductors and equipment and where overcurrent protection is required for systems that are connected to both inherently power-limited sources and sources with higher current availability. Revised exception to include dc-to-dc converter source circuits.	FR-972, SCR-100
690.9(B)	Revised to include requirement for overcurrent protective devices used in the dc portion of a PV system be listed for use in PV systems, to add clarity by arranging requirements and former exception text into a list, and to add adjustable electronic devices as a protection method.	SR-942
690.9(C) (2014)	Deleted because requirement has been integrated into 690.9(B).	FR-972
690.9(C)	Relocated text from 690.9(D) of the 2014 edition and revised to apply same equipment and conductor OCPD requirement to grounded and ungrounded PV dc systems.	FR-972, SR-943
690.9(D) (2014)	Revised and relocated to 690.9(C).	FR-972
690.9(D)	Relocated from 690.9(F) of the 2014 edition.	FR-972
690.9(E) (2014)	Deleted based on revision made to 690.9(C).	FR 972, SR-943
690.9(F) (2014)	Relocated to 690.9(D)	FR-972
690.10	Revised to reference 710.15 for requirements covering stand-alone systems.	SCR-101
690.10(A) through (D) (2014)	Relocated to 710.15 in new Article 710, Stand-Alone Systems.	SCR-101
690.11	Revised to apply arc-fault protection requirement to all PV system dc circuits, to remove performance requirements more appropriately covered in product standards, and to add exception exempting conductors associated with certain PV installations from the arc-fault requirement.	SR-945
690.12	Revised to specify objective of rapid shutdown and to provide exception exempting circuits associated with certain PV installation from the rapid-shutdown requirement. Deleted cross-reference to 690.56(C) because it is expected that designers, installers, and inspectors will review and implement all applicable marking requirements from 690.56, including those covering rapid shutdown.	FR-1008, SCR-102
690.12(A)	Revised to clarify that rapid shutdown applies only to conductors of circuits supplied by the PV system.	FR-1008, SCR-102
690.12(B)	Revised to establish a boundary creating two areas of rapid shutdown protection, to provide separate requirements for protection inside and outside of the boundary, and to specify performance requirements for the rapid shutdown equipment inside and outside the boundary.	FR-1008, SCR-102
690.12(C)	Added requirements covering the operation, indication, location, number of, and type of device(s) used to initiate rapid shutdown.	FR-1008, SCR-102
690.12(D)	Revised to specify equipment used for rapid shutdown protection must be listed specifically for providing that protection.	FR-1008, SCR-102

(continues)

Section	Comments	FR/SR/SCR Reference
690.13	Revised to specify that all PV systems must be provided with a means to disconnect the PV system from all other wiring systems and to clarify the disconnecting means must open all circuit conductors.	FR-1014
690.13(A)	Revised to correlate with requirements for rapid shutdown specified by 690.12 and to move bathroom prohibition to 690.4(E).	SR-946
690.13(B)	Revised to require marking that indicates the position (on or off) of the disconnecting means and to mark the disconnecting means with a specific warning where line and load terminals are energized when it is in the open position.	SR-947
690.13(C)	Revised to require SUSE (suitable for use as service equipment) rated equipment only where PV system is connected on the supply side of the service disconnecting means.	FR-1014
690.13(D)	Revised requirement and added informational note to clarify that more than one PV system can be installed and each PV system can be provided with a maximum of six disconnecting means. Added text to clarify what constitutes the PV system disconnecting means where multiple interactive inverters are interconnected to other power sources through a single ac disconnecting means.	FR-1014
690.13(E) (2014)	Deleted specific text of this requirement because the revision to the general rule for PV disconnects in 690.13 meets the intent of 690.13(E) as stated in the 2014 edition.	FR-1014
690.13(E)	Added requirement establishing the minimum ratings for PV disconnecting means.	SR-948
690.13(F)	Added requirement specifying the requisite conditions for PV system disconnecting means.	SCR-103
690.15	Revised requirement and added informational note to clearly state purpose of the isolating devices/disconnecting means required by this section, to specify which conductors of the circuit are subject to the requirement, and to establish current level at which isolating devices (connectors) are not permitted to be used.	FR-1013
690.15(A)	Revised to establish proximity of isolating device or equipment disconnecting means to the equipment it serves to isolate.	FR-1013, SCR-104
690.15(B)	Added requirement on interrupting rating of equipment disconnecting means used for equipment isolation.	FR-1013
690.15(C)	Added requirement covering performance, type, and marking of equipment isolating devices.	SR-950
690.15(D)	Added requirement covering performance, type, and marking of equipment disconnecting means.	FR-1013, SCR-105
690.16 (2014)	Deleted of section because requirements are now covered by 690.15.	FR-1009
690.17 (2014)	Deleted section because requirements are now covered by 690.13 and 690.15.	FR-1009
690.18 (2014)	Deleted requirement that was more oriented toward maintenance and servicing of modules rather than their installation.	FR-1009
690.31(A)	Revised to include Type MC cable as a wiring method, to relocate and reidentify Table 690.31(E) as Table 690.31(A) for application to all wiring methods, and to remove informational note containing outdated reference to conductors used for module interconnection.	SR-953
690.31(B)	Revised to consolidate redundant requirements, to specify identification is required for “accessible” conductors, and to require that only solidly grounded conductors comply with 200.6.	SR-954
690.31(C)(1)	Revised to reference Articles 334 and 338 for supporting and securing of single-conductor cable.	SR-955
690.31(C)(2)	Revised to replace “labeled” with “identified” relative to use of single-conductor PV wire in cable trays.	SR-955
690.31(D)	Revised to simplify requirement by specifying multiconductor cables be listed and identified for the conditions associated with installations in outdoor locations.	SR-956
690.31(E)	Revised to clarify use of flexible cords, flexible cables, and stranded copper PV wire for making connections to moving parts of tracking arrays. Added table establishing the minimum number of strands for PV wire sizes 18 AWG through 1000 kcmil.	SR-957

Section	Comments	FR/SR/SCR Reference
690.31(G)	Revised to incorporate new term “PV system dc circuits” and to specify the requirement applies only to PV systems in or on buildings.	SR-959
690.31(G)(3)	Revised to incorporate new term “PV system dc circuits.”	SR-961
690.31(G)(4)	Revised to incorporate new term “PV system dc circuits.”	SR-962
690.31(I)	Revised to remove the term “photovoltaic system voltage” and to clarify the type of bipolar system requiring a notice warning of the hazard resulting from disconnecting the grounded conductor.	FR-978
690.31(J) (2014)	Deleted requirement addressing a hazard that could not occur in a two-wire circuit.	SR-963
690.33	Revised to exempt connectors associated with certain building integrated photovoltaic (BIPV) products.	SR-964
690.33(C)	Revised to differentiate between the dc and ac circuit voltage at which a tool is needed to open a connector.	SR-965
690.35(2014)	Deleted section because its requirements were either covered elsewhere or were not prohibited by Article 690. (There is no need to distinguish between ungrounded and reference grounded PV system/circuits in regard to wiring methods.)	FR-982
Article 690, Part V	Revised to add “bonding” to title of Part V.	FR-983
690.41(A)	Revised to clarify methods of grounding PV systems by distinguishing between functional (reference) and solidly grounded systems for correlation with related changes throughout Article 690.	SR-966
690.41(B)	Relocated requirements for ground-fault protection from 690.5 and revised to correlate with related changes on “functional” grounded systems throughout Article 690. Deleted warning label requirement as a result of new equipment isolation requirements in 690.15.	SR-966
690.42	Revised to clarify the location of the grounding connection for systems with dc ground-fault protection and dc systems that are solidly grounded, and to incorporate into the general rule language from exception in the 2014 edition.	SR-967
690.43	Revised to consolidate and clarify equipment bonding requirements and to recognize the increased availability of products listed, labeled, and identified for making bonding connections to module frames and metal support structures.	FR-993
690.45	Revised to clarify basis for sizing equipment grounding conductors for PV source and PV output circuits.	SR-968
690.46	Revised to follow the general requirement covering the use of solid conductors in raceways.	FR-985
690.47(A)	Revised requirement and added informational note to clarify and differentiate grounding electrode connection requirements for reference (functional) grounded systems from those required for solidly grounded systems.	FR-995, SCR-106
690.47(B)	Revised to change connection of an array frame or structure from a mandatory to a permissive requirement.	FR-995, SCR-106
690.48 (2014)	Deleted requirement related to maintenance/repair procedure on a completed installation.	FR-986
690.49 (2014)	Deleted requirement related to maintenance/repair procedure on a completed installation.	FR-986
690.53	Revised to clarify that the requirement applies to dc PV system disconnecting means and to required dc equipment disconnecting means.	SR-970
690.55	Revised to specify required marking of PV system output circuit conductors where they are connected to an energy storage system.	SR-971
690.56(A)	Revised to remove detail on acceptance of plaque or directory location and to remove reference to marking requirement for wiring methods in 690.31(G)(4).	FR-997
690.56(B)	Revised to default to marking requirement specified by 705.10.	FR-998
690.56(D)	Revised to provide text, symbols, font color, and other details to be used on signs indicating the type of rapid shutdown provided at a building. Revised to include examples of rapid shutdown signs, to establish requirement for providing a directory where different types of rapid shutdown or systems without rapid shutdown are located on the same building, and to set requirements for identifying the rapid shutdown switch.	FR-989, SCR-107

(continues)

Section	Comments	FR/SR/SCR Reference
Article 690, Part VII	Revised Part VII to include only 690.59, which references Parts I and II of Article 705.	SCR-108
Article 690, Part VIII	Revised Part VIII to include only 690.71, which contains a reference to new Article 706, Energy Storage Systems, and 690.72, which covers self-regulated PV charge control for systems interconnected with an energy storage system.	FR-1012
Article 690, Part IX (2014)	Deleted Part IX because it did not contain requirements unique to PV systems operating over 1000 volts.	FR-1010
Article 690, Part X (2014)	Deleted Part X because it did not contain requirements unique to electric vehicle supply equipment supplied by a PV system. (EVSE may be supplied by, but is not part of a PV system.)	FR-1011
Article 691		
Article 691	Added article with requirements on applicability, installation, equipment approval, engineered design, disconnection, and arc-fault mitigation unique to large-scale photovoltaic electric power production facilities.	SCRs-110, 111, 112 SRs-976, 977, 978, 979, 981, 982, 983, 984, 985
Article 692		
692.1	Revised to create simplified comprehensive scope statement along with an informational note describing several modes of fuel cell operation.	SCR-113
692.3 (2014)	Deleted requirement deemed unnecessary based on proper use of code structure per 90.3.	FR-946
692.6	Revised to include field labeling as a certification option and edits to provide text consistent with parallel requirements in Articles 690 and 694.	FR-946
692, Part VIII (2014)	Deleted Part VIII because the general requirements for installations rated over 1000 volts apply to fuel cells.	FRs-912 and 913
Article 694		
Entire article	Revised throughout to remove “small” prior to “wind” for correlation with scope of article.	FR-7516 (Global Input)
694.1	Revised to make text similar to that contained in the scopes and associated informational notes of Articles 690 and 692 and to Informational Note Figure 694.1(a) to illustrate that wind power systems may be interconnected with other than utility electric power production sources.	SR 922
694.2, Guy (2014)	Deleted term that is not unique in application to Article 694.	SR-923
694.2, Tower	Revised to make term unique in application to Article 694.	SR-924
694.3 (2014)	Deleted requirement deemed unnecessary based on proper use of code structure per 90.3.	FR-914
694.7(B)	Revised to include field labeling as a certification option and to include text and associated informational note related to the process involved in the certification and listing of wind electric systems.	SR-925
694.7(D)	Revised the term used to describe the location at which Type 3 SPDs are permitted to be installed.	FR-944
694.7(F)	Revised to include field labeling as a certification option and to delete unnecessary description of pole or tower material.	FR-915
694.7(G)	Added requirement providing working space clearances unique to Article 694.	SR-921
694.10(A)	Revised to remove cross-reference to requirements that have been deleted from Article 694.	FR-917
694.18 (2014)	Deleted requirements covering stand-alone systems based on inclusion of new Article 710.	FR-916
694.40	Revised to use terminology that correlates with Article 250, to remove unnecessary cross-references, and to provide additional guidance in the informational note.	FR-1024
694.60	Revised to require that equipment be “labeled” in addition to being “listed” and “identified.”	FR-999
694, Part VIII (2014)	Deleted Part VIII because the general requirements for installations rated over 1000 volts apply to wind electric systems.	FR-918
Article 695		
695.3 Informational Note	Added informational note containing NFPA 20 references covering power supply reliability.	FR-3651
695.3(C)(1) and (2)	Revised to provide more specific cross-references.	FR-3652

Section	Comments	FR/SR/SCR Reference
695.4(B)(1)(3)(b)	Deleted text to correlate with change made in 695.4(B)(2)(a)(1) on sizing feeder overcurrent protective devices at multibuilding campus-style complexes.	FR-3653
695.4(B)(2)(a)(1)	Revised to clarify requirement for sizing feeder overcurrent protective devices at multibuilding campus-style complexes.	FR-3653
695.4(B)(3) a)(1) through (4)	Added exception to clarify that a normal source disconnecting means at multibuilding campus-style complexes is only subject to the requirement for lockable disconnecting means.	SR-3622
695.6(A)(2)	Revised to clarify that certified cable and raceway systems are available to meet the requirement for 2-hour protection from fire.	SR-3623
695.6(D)	Revised to remove restriction on installing only one type of LFNC.	FR-3655
695.6(E)	Revised to clarify that GFPE is not prohibited in power circuits upstream of the fire pump power circuit, to align with NFPA 20.	SR-3624
695.14(E)	Revised to remove restriction on installing only one type of LFNC and to include EMT as a permitted wiring method.	SR-3625
695.14(F)	Revised to add control circuit supervision and failure mode requirement. Added informational note with referencing NFPA 20. Revised and relocated existing informational note on electrical circuit protective systems.	SR-3626
695.15	Added requirement covering surge protection of fire pump controllers.	FR-3658
Article 700		
700.2, Branch Circuit Emergency Lighting Transfer Switch	Added definition and associated Informational Note for equipment listed to transfer power at the branch circuit level.	FR-3607
700.2, Luminaire, Directly Controlled	Added definition and associated informational note for dimmable luminaires that are automatically restored to full illumination when power is transferred from normal to emergency source.	SR-3601
700.3(C)	Revised to expand requirement to other emergency system equipment.	FR-3608
700.3(F)	Added requirement to provide means to connect a portable or temporary alternate power source when permanently installed alternate power source is out of service for maintenance or repair.	FR-3616, SCR-84
700.4(B)	Deleted last sentence to correlate with new requirement in 700.3(F).	FR-3617
700.5(C)	Revised to expand listing requirement to all equipment voltage ratings.	FR-3609
700.5(F)	Added requirement for field marking of transfer equipment with short-circuit current rating.	FR-7518
700.6(D)	Revised requirement covering the location of ground-fault sensing equipment where multiple alternate sources are connected in parallel.	FR-3638
700.7(A)	Revised to address premises having multiple on-site alternate sources of emergency power.	FR-3611
700.10(A)	Revised to expand applicability to raceways, cables, and receptacles.	FR-3612, SCR-85
700.10(B)(5)	Revised requirement and added informational note figures to clarify compliant options for supplying common bus from which emergency circuits are supplied.	FR-3613
700.10(D)	Revised to add new occupancy types where emergency feeders are required to be protected from fire.	SR-3612
700.10(D)(1)	Revised to clarify methods of protecting emergency feeders from fire and to correlate terminology with that used in product certification standards.	SR-3604
700.10(D)(3)	Revised to add control circuit supervision and failure mode requirement.	SR-3611
700.12	Revised to add new occupancy types where the alternate source of emergency power is required to be protected from fire.	SR-3613
700.12(A)	Revised to delete performance and maintenance related inspection requirements that are addressed in NFPA 111.	SR-3606
700.12(F)(2)(1)	Revised to remove provision that is part of the product certification process and improve readability.	SR-3607

(continues)

Section	Comments	FR/SR/SCR Reference
700.25	Added requirement establishing conditions of use for transfer switches installed in branch circuits.	FR-3620
700.31	Revised to improve technical accuracy.	FR-3621
Article 701		
701.3(C)	Revised to expand requirement to other legally required standby system equipment.	FR-3623
701.5(C)	Revised to expand listing requirement to all equipment voltage ratings.	FR-3624
701.5(D)	Added requirement for field marking of transfer equipment with short-circuit current rating.	FR-7519
701.6(A)	Revised to clarify condition of alternate power source operation covered by the requirement.	FR-3625
701.6(D)	Revised covering the location of ground-fault sensing equipment where multiple alternate sources are connected in parallel.	SR-3608
701.7(A)	Revised to address premises having multiple on-site alternate sources of legally required standby power.	FR-3626
701.12(A)	Revised to delete performance and maintenance related inspection requirements that are addressed in NFPA 111.	SR-3609
701.12(G)(4)	Revised to remove requirement that is part of the product certification process and improve readability.	SR-3610
701.26	Revised to improve technical accuracy.	FR-3629
Article 702		
702.5	Added requirement for field marking of transfer equipment with short-circuit current rating.	FR-7520
702.6(A)	Revised to clarify condition of alternate power source operation covered by the requirement.	FR-3630
702.7(A)	Revised to address premises having multiple on-site alternate sources of legally required standby power.	FR-3631
702.12(A)	Revised of title to clarify application of requirement.	FR-3633
702.12(C)	Added requirement for connection of portable generators to premises wiring systems using power inlets rated 100 amperes and greater.	FR-3632
Article 705		
705.2, Interactive Inverter Output Circuit	Revised to recognize that interactive connections are not made exclusively to utility sources.	FR-1042
705.2, Microgrid Interconnect Device (MID)	Added definition for equipment used with an onsite generation and distribution system to disconnect from and operate in parallel with a primary power source.	SR-989
705.2, Microgrid System	Added definition for on-site premise power generation, storage, and distribution system that cannot operate independently from or in parallel with a primary power source.	SR-988
705.2, Multimode Inverter	Revised to recognize that interactive inverters are not used exclusively with utility sources.	SR-990
705.2, Stand-Alone System	Relocated definition used in more than one article to Article 100 .	SR-991
Table 705.3	Added references to new related articles.	SR-992
705.6	Relocated from 705.4. Revised to identify typical power sources that are interconnected, to include field labeling as an equipment certification option, and to recognize that interactive connections are not made exclusively to utility sources.	SR-993
705.8	Relocated from 705.6 .	SR-994
705.10	Revised to clarify where plaques or directories are to be located and to require the markings comply with 110.21(B) .	FR-1043
705.12(B) and (C) (2014)	Deleted as a result of revisions to 705.12 specifying interconnections are made either on the supply side or on the load side of the service disconnecting means.	SR-995
705.12(B)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	SR-997
705.12(B)(1)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	FR-1025
705.12(B)(2)(1)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	FR-1025

Section	Comments	FR/SR/SCR Reference
705.12(B)(2)(2)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	FR-1025
705.12(B)(2)(3)(a)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	FR-1025
705.12(B)(2)(3)(b)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	FR-1025
705.12(B)(2)(3)(d)	Added requirement to accommodate interconnected sources in a center-fed panelboard installed at dwelling units.	SR-997
705.12(B)(2)(3)(E)	Revised to clarify requirement covering engineered approach to busbar protection.	SR-997
705.12(B)(5)	Revised to expand applicability to all sources of power that are interconnected with the primary source.	SR-997
705.12(B)(6) (2014)	Deleted requirement due to unavailability of equipment to provide required circuit protection.	FR-1025
705.21	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1026
705.22	Revised to correlate requirements for rating of disconnecting means with those contained in Article 690, to provide for warning messages consistent with those contained in Article 690, and to reference 110.25 for locking requirements.	SCR-114
705.23	Added requirement for a means to disconnect/isolate interactive systems from other sources and equipment.	SR-999
705.30(D)	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1027
705.40	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1036
705.42	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1036
Article 705, Part II	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1030
705.60(B)	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1037
705.60(C)	Added requirement for the ampacity of power source output circuit conductors connected to feeder conductors having a higher ampacity than the output conductors.	SCR-115
705.70	Revised to recognize that interactive inverters are not used exclusively with utility sources and to use acronym for alternating and direct current.	FR-1038
705.82	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1033
705.95(B)	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1034
705.100(A) and Informational Note	Revised to recognize that interactive inverters are not used exclusively with utility sources.	FR-1035
Article 705, Part IV	Added Part IV, which contains requirements for power source(s) that can be operated as a microgrid independent of other power sources.	FR-1045, SCR-116
Article 706		
Article 706	Added article covering energy storage systems that includes defined terms and requirements on system classification, equipment certification, disconnecting means, connection to other energy sources, location, directories, circuit sizing, overcurrent protection, charge control, electrochemical energy storage systems, flow battery energy storage systems, and other energy storage technologies.	FR-3622; SRs-3643, 3634, 3638, 3658, 3635, 3659, 3636, 3633, 3640, 3641, 3644, 3645, 3646, 3648, 3649, 3631, 3651, 3652, 3653, 3654, 3655, 3632, 3656, 3657; SCRs-86, 87, 88, 89, Global SCR-119
Article 708		
708.10(A)(2)	Revised to require receptacles supplied from the COPS be equipped with visible means to indicate device is energized.	FR-3634

(continues)

Section	Comments	FR/SR/SCR Reference
708.10(C)(1)	Revised to clarify mandatory intent to use only specified wiring methods.	FR-3659
708.10(D)(2)	Revised to provide consistency with Article 700 requirements for protecting feeders from fire and to correlate terminology with that used in product certification standards.	SR-3605
708.20(E)	Revised to expand requirement to cover new, in addition to existing, battery technologies.	FR-3636
708.24(E)	Added requirement for field marking of transfer equipment with short-circuit current rating.	FR-7521
708.52(B)	Deleted statement specifying that GFPE is not required for equipment supplied by ungrounded systems.	FR-3660
Article 710		
Article 710	Added article covering stand-alone systems that includes requirements on equipment certification, supply capacity, conductor sizing, use of 120-volt circuits to supply 240-volt equipment, energy storage equipment, back-fed circuit breakers, and supply voltage and frequency control.	SR-987
Article 712		
Article 712	Added article covering direct current microgrids that includes defined terms and requirements on equipment certification, circuit requirements, disconnecting means, wiring methods, ground-fault and arc-fault detection/protection, grounding, marking, overcurrent protection, and systems rated over 1000 volts.	FR-3663, SR-3627
Article 725		
725.1	Revised to replace “appliance” with “utilization equipment.”	FR-619
725.3(C)	Revised existing exception for permitting cables installed in ducts in accordance with 725.135(B). Added exception permitting cables to be installed in other spaces used for environmental air where installed in accordance with 725.135(C).	SR-609
725.3	Revised to include new list items (M) for cable routing assemblies and (N) for communications raceways.	FR-624
725.121(A)(4)	Revised to expand the limited-power circuit equipment permitted as a power source. Revised the informational note by referencing additional UL standards.	FR-620
725.121(C)	Added requirement for labeling of limited power circuit output connection points on listed IT equipment and listed industrial control panels and equipment.	SCR-25
725.133	Revised to update the reference to include new section 725.144.	SR-612
725.135(C)	Revised to permit cables installed in plenum cable routing assemblies and Types CL2P and CL3P cables supported by open metallic cable trays or cable tray systems.	FR-626
725.135(J)	Revised to permit Type PLTC-ER cable to transition between cable trays and between cable trays and utilization equipment or devices for a distance not to exceed 1.8 m (6 ft) without continuous support.	FR-627
725.135(K)	Revised to expand permitted installations under modular flooring and planks.	SR-620
725.135(L)	Revised to expand permitted installations under modular flooring and planks.	SR-621
725.135(M)	Revised to expand permitted installations under modular flooring and planks.	SR-622
725.144	Added section to provide requirements for cables that are used for transmission of data and power.	SR-611
Table 725.154(A)	Revised to include CMUC and permitted use of cable routing assemblies.	FR-628
725.170	Added requirement for listing and marking of equipment for power and data transmission.	SR-614
725.179	Revised to delete cable routing assemblies and communications raceways to correlate with 725.3(M) and (N).	SR-615
725.179(G)	Revised to include minimum temperature ratings for Class 2 and 3 cables.	FR-630
725.179(I)	Added requirement for limited power (LP) cables.	SR-615
Article 727		
727.4(5)	Added exception to permit Type ITC-ER cable to transition between cable trays and between cable trays and utilization equipment or devices for a distance not to exceed 1.8 m (6 ft) without continuous support.	FR-631

Section	Comments	FR/SR/SCR Reference
Article 728		
728.4	Revised to delete portion of requirement redundant to 110.2 per NEC arrangement specified in 90.3.	FR-632
728.5 (C)	Revised to include requirement and associated informational note covering raceway fill for fire-resistive cable systems.	FR-633
Article 760		
760.3(B)	Revised existing exception for permitting cables installed in ducts. Added and new exception permitting cables to be installed in other spaces used for environmental air where installed in accordance with 760.135(C).	SR-616
760.3(L)	Revised to include new list item for cable routing assemblies.	FR-646
760.3(M)	Revised to include new list item for communications raceways.	FR-646
760.53(B)	Revised to correlate with 300.22 terminology.	FR-635
760.133	Revised to add “cable routing assemblies” and to correlate with 725.133.	FR-636
760.135(B)	Revised to correlate with 300.22 terminology.	FR-639
760.135(C)	Revised to include Type FPLP cables installed in plenum routing assemblies.	FR-640
Table 760.154	Revised to include permitted use of cable routing assemblies.	FR-641
760.176	Revised to include minimum temperature ratings for non-power-limited fire alarm cables.	SR-618
760.176(G)	Revised to require additional marking for conductor size and temperature ratings for cables rated in excess of 60°C (140°F).	FR-643
760.179(C)	Revised to include minimum temperature ratings for PLFA cables.	SR-619
760.179(I)	Revised to require additional marking for conductor size and temperature ratings for cables rated in excess of 60°C (140°F).	FR-642
Article 770		
770, Informational Note	Revised to delete explanatory material that identified changes in terminology from previous editions of the NEC.	FR7503
770.2	Deleted definitions because defined terms have been relocated to Article 100.	FR-4511, FR-4513, FR-4514, FR-4515
770.2, Exposed (to Accidental Contact)	Added informational note referencing additional definitions of <i>exposed</i> in Article 100.	SR450
770.12 (2014)	Relocated to section 770.110.	FR4517
770.24	Added informational note recognizing that contaminants may impact optical fiber cable properties.	PI-563 & PC-73
770.44	Added section that provides requirements for overhead outside plant optical fiber cables.	FR4519
770.48(A)	Revised to permit RMC and IMC to extend the point of entry.	SR4511
770.48(B)	Revised to clarify restrictions for unlisted outside plant cable installed in rigid polyvinyl chloride conduit and electrical metallic tubing.	FR4521
770.93	Revised to delete the informational note.	FR4523
770.100(B)(1)	Revised to delete the informational note.	FR4524
770.100(B)(2)	Revised to include a reference to 250.94(A) for intersystem bonding terminations.	SR26
770.100(B)(3)	Revised to clarify that lightning protection system conductors, not just air terminals, are not be used as a part of the grounding electrode conductor or as a grounding electrode.	FR4526
770.100(D), Informational Note No. 1	Revised to clarify that no lightning protection system component may be used to provide the required bonding jumper.	FR4527
770.110(A)(2)	Revised to include the applications requirements of Table 800.154(b), the listing requirements of 800.182, and for correlation with 770.110(C), cable routing assemblies.	SR4513

(continues)

Section	Comments	FR/SR/SCR Reference
770.110(A)(3)	Relocated from section 770.12.	FR4517
770.110(C)	Revised to include the reference to listing requirements of 800.182 and the installation requirements of 800.110(C).	FR4529
770.113	Revised to include cable routing assemblies.	FR4530
770.113(A)	Revised to include a reference to 770.179.	SR4514
770.113(C)	Revised to include a reference to 800.182 listing requirements for communications raceways and cable routing assemblies and to delete Informational Note No. 2.	FR4533
770.113(D)	Revised to delete raceways and cable routing assemblies because their requirements are covered in 770.110.	FR4534
770.113(E)	Revised to include innerduct.	FR4535
770.133(B)	Revised to combine requirements for “with communication cables” and “with other circuits” under one subdivision.	FR4540
770.133(C)	Revised to add “Optical Fiber” to the title.	FR4541
Table 770.154(a)	Revised to correlate with 770.113 and permitted use of cable routing assemblies. Revised terminology to correlate with 300.22. Deleted Informational Note No. 3.	FR4542
770.179	Revised to require additional marking for conductor temperature ratings for cables rated in excess of 60°C (140°F).	FR4543
Article 800		
Article 800, Informational Note	Revised to delete the explanatory material that identified changes in terminology from previous editions of the NEC.	FR-7504
800.2	Deleted specific definitions because defined terms have been relocated to Article 100.	FR-4502 and SR-4504
800.2, Exposed (to Accidental Contact)	Added informational note referencing additional definitions of <i>exposed</i> in Article 100.	SR-4562
800.2, Point of Entrance	Revised to delete “from rigid metal conduit (RMC), or from intermediate metal conduit (IMC)” to correlate with 800.48.	SR-4519
800.3(H)	Added item to address temperature limitation of conductors.	SR-4566
800.12	Revised to delete section and relocate to 800.110(A).	FR-4888
800.24	Revised to add a reference to 800.170(C) for additional listing requirements. Added informational note providing possible contaminants of optical fiber cables during the construction process.	SR-4522
800.47(A)	Revised title to correlate with section content and titles in Articles 770 and 820.	FR-4653
800.48	Revised to permit RMC and IMC to extend the point of entry.	SR-4524
800.53	Added informational note referencing NFPA 780 for separation distances.	FR-4656
800.90(A)(3)	Added informational note referencing NFPA 780.	FR-4657
800.93	Revised title to clarify that it is the non-current-carrying members that are to be grounded.	FR-4659
800.100(B)(2)	Revised to include a reference to 250.94(A) for intersystem bonding terminations.	SCR-27
800.100(B)(3)	Revised to clarify that lightning protection system conductors, not just air terminals, are not be used as a part of the grounding electrode conductor or as a grounding electrode.	FR-4662
800.100(D)	Revised to clarify that no lightning protection system component may be used to provide the required bonding jumper.	FR-4663
800.110(A)(2)	Revised to include the applications requirements of Table 800.154(b) and the listing requirements of 800.182 and for correlation with 800.110(C), cable routing assemblies.	FR-4664
800.110(A)(3)	Relocated from 770.12.	FR-4688
800.110(C)	Revised to include the reference to listing requirements of 800.182 and the installation requirements of 800.110(C).	FR-4665
800.113(C)	Revised to include a cable routing assemblies.	FR-4668

Section	Comments	FR/SR/SCR Reference
800.113(E)	Revised to include innerduct.	FR-4670
800.113(J)	Revised to expand permitted installations under modular flooring and planks.	FR-4671
800.113(K)	Revised to expand permitted installations under modular flooring and planks.	FR-4672
800.113(L)	Revised to expand permitted installations under modular flooring and planks.	FR-4673
800.133(A)(1)	Revised to combine requirements for “optical fiber and communication cables” and “other circuits” under one subdivision.	SR-4535
Table 800.154(a)	Revised to correlate with 800.113 and permitted use of cable routing assemblies. Revised terminology to correlate with 300.22 and Informational Note No. 1 referring to 800.2 for definition of <i>point of entrance</i> . Deleted Informational Note No. 3.	FR-4676 and SR-4535
800.154(B)	Revised terminology to correlate with 300.22 and expansion of permitted installations under modular flooring and planks and to add “communication raceway” to the table note.	FR-4676
800.179	Revised to require additional marking for conductor temperature ratings for cables rated in excess of 60°C (140°F).	FR-4678
800.179(G)	Revised to delete the reference to 800.179(E) because there are currently no CMX-CI cables and no “fire-resistive” CMX cables.	FR-4680
800.182	Revised to clarify that “communications” does not modify “cable routing assemblies” and to add a reference to new Tables 800.182(a) and (b).	FR-4684
Table 800.182(a)	Added table that includes marking requirements for cable routing assemblies.	FR-4684
Table 800.182(b)	Added table that includes marking requirements for communications raceway.	FR-4684
800.182(A)	Revised to clarify that “communications” does not modify “cable routing assemblies.” Added two informational notes to provide guidance on fire-resistant and low-smoke producing characteristics and added informational note referencing NFPA 90A.	SR-4537
800.182(B)	Revised to clarify that “communications” does not modify “cable routing assemblies.” Added informational note to reference standards that define fire-resistant characteristics.	FR-4686
800.182(C)	Revised to clarify that “communications” does not modify “cable routing assemblies.” Added informational note referencing standards that define fire-resistant characteristics.	FR-4687
Article 810		
Article 810, Informational Note	Revised to delete the explanatory material that identified changes in terminology from previous editions of the NEC and to add references to Figures 800(a) and 800(b).	FR-7505
810.15	Revised to define a zone where grounding is not required and new informational note referencing NFPA 780.	FR-4546
810.18, Informational Note No. 1 and 2	Revised Informational Note No. 1 to include a reference for sideflash calculations in NFPA 780.	FR-4547
Article 820		
Article 820, Informational Note	Revised to delete the explanatory material that identified changes in terminology from previous editions of the NEC and to add references to Figures 800(a) and 800(b).	FR-7506
820.2, Coaxial Cable	Deleted definition because defined term has been relocated to Article 100.	FR-4501
820.2, Exposed (to Accidental Contact)	Added informational note referencing additional definitions of <i>exposed</i> in Article 100.	SR-4556
820.2, Point of Entrance	Revised to delete “from rigid metal conduit (RMC), or from intermediate metal conduit (IMC)” to correlate with 820.48.	SR-4541
820.3(J)	Revised to delete section and relocate to 820.110.	FR-4551
820.24	Revised to add a reference to 800.170(C) for additional listing requirements. Added informational note to provide possible contaminants of optical fiber cables during the construction process.	SR-4503
820.44(E)(3)	Added informational note referencing NFPA 780 for sideflash calculations.	FR-4554
820.47(B)	Revised to add non-power-limited fire alarm cables.	FR-4555

(continues)

Section	Comments	FR/SR/SCR Reference
820.48	Revised to permit RMC and IMC to extend the point of entry.	SR-4542
820.49	Revised to include all metallic entrance conduit for grounding.	FR-4557
820.100, Exception	Revised to permit alternative grounding where entirely inside of a building or within a defined zone. Added informational note referencing NFPA 780.	FR-4559
820.100(B)(2)	Revised to include a reference to 250.94(A) for intersystem bonding terminations.	SCR-31
820.100(B)(3)	Revised to clarify that lightning protection system conductors, not just air terminals, are not be used as a part of the grounding electrode conductor or as a grounding electrode.	FR-4562
820.100(D), Informational Note No. 1	Revised to clarify that no lightning protection system component may be used to provide the required bonding jumper.	FR-4563
820.110(A)(2)	Revised to include references to Table 800.154(b) for application requirements, 800.182 for listing requirements, and 362.24 through 362.56 for electrical nonmetallic tubing.	FR-4564
820.110(A)(3)	Added subsection to include requirements for innerduct for coaxial cable.	SR-4544
820.110(C)	Revised to include references to Table 800.154(c) for application requirements and 800.182 for listing requirements, and to delete the installation requirements covered in the reference to 800.113.	FR-4565
820.113	Revised to add cable routing assemblies.	FR-4566
820.113(B)	Revised to correlate with 300.22 terminology.	FR-4568
820.113(C)	Revised to clarify specific types of communications raceways and cable routing assemblies.	FR-4569
820.113(E)	Revised to include innerduct.	FR-4571
820.133(A)(1)	Revised to combine requirements for “optical fiber and communication cables” and “other circuits” under one subdivision.	FR-4578
Table 820.154a	Revised to correlate with 800.113 and permitted use of cable routing assemblies. Revised terminology to correlate with 300.22 and Informational Note No. 1 referring to 800.2 for definition of <i>point of entrance</i> . Deleted Informational Note No. 3.	FR-4580
820.179	Revised to require additional marking for conductor temperature ratings for cables rated in excess of 60°C (140°F).	FR-4581
Article 830		
Article 830, Informational Note	Revised to delete the explanatory material that identified changes in terminology from previous editions of the <i>NEC</i> .	FR-7507
830.1, Informational Note No. 1	Revised to add twisted pair broadband communications media type.	FR-4588
830.2, Exposed (to Accidental Contact)	Added informational note referencing additional definitions of <i>exposed</i> in Article 100.	SR-4547
830.2, Network-Powered Broadband Communications Circuit	Revised to replace “single-family” with “one-family dwelling” to correlate with the definition in Article 100.	FR-4591
830.3(E)	Revised to replace “optical network terminal” with “network interface unit.”	FR-4592
830.3(G) (2014)	Deleted section because requirements are covered in 830.110(C).	FR-4593
830.24	Revised to add 300.4(A), (D), (E), and (F) to provide physical protection methods and 800.170(C) for low smoke and heat release properties. Added informational note to provide possible contaminants of optical fiber cables during the construction process.	SR-4503
830.44(G)(3), Informational Note	Added informational note referencing NFPA 780 for sideflash calculations.	FR-4597
830.44(G)(4), Exception	Revised to clarify protection pertains to physical protection.	FR-4598
830.47(A)	Revised title to correlate with section content and titles in Articles 770 and 820.	FR-4599
830.49	Revised to include all metallic entrance conduit for grounding.	FR-4601
830.90(A)	Added informational note to reference NFPA 780.	FR-4602
830.93(A)	Deleted the informational note.	FR-4603

Section	Comments	FR/SR/SCR Reference
830.100(B)(1)	Deleted the informational note.	FR-4604
830.100(B)(2)	Revised to include a reference to 250.94(A) for intersystem bonding terminations.	SR-32
830.100(D), Informational Note No. 1	Revised to clarify that no lightning protection system component may be used to provide the required bonding jumper.	FR-4607
830.110(A)(2)	Revised to include references to Table 800.154(b) for application requirements, 800.182 for listing requirements, and 362.24 through 362.56 for electrical nonmetallic tubing.	FR-4608
830.110(A)(3)	Added subsection to include requirements for innerduct.	FR-4609
830.110(C)	Revised to include references to Table 800.154(c) for application requirements and 800.182 for listing requirements, and to delete the installation requirements covered in the reference to 800.113.	FR-4610
830.113	Revised to add a reference to 830.110 for installation requirements for raceways and cable routing assemblies.	FR-4611
830.113(B)	Revised to correlate with 300.22 terminology.	FR-4612
830.113(C)	Revised to clarify specific types of communications raceways and cable routing assemblies.	FR-4613
830.113(E)	Revised to include innerduct.	FR-4615
830.113(H)	Added section to address requirements for cable trays.	FR-4618
830.133(A)(1)	Revised to combine requirements for “low-power network-powered broadband communications circuit cables with optical fiber cables and low-power network-powered broadband communications circuit cables with other circuits” under one subdivision.	FR-4645
Table 830.154(a)	Revised to correlate with 800.113 and permitted use of cable routing assemblies. Revised terminology to correlate with 300.22 and Informational Note No. 1 referring to 800.2 for definition of <i>point of entrance</i> . Deleted Informational Note No. 3.	SR-4555
830.179	Revised to require minimum temperature rating and additional marking for conductor temperature ratings for cables rated in excess of 60°C (140°F).	FR-4621
Article 840		
840.1	Revised to expand the scope to include other types of broadband communications systems. Revised the informational note to provide information on the expanded scope and types of equipment employed.	FR-4582
840.2	Revised to include a reference to 645.2.	FR-4583
840.2, Fiber-to-the-Premises (FTTP)	Deleted definition because the term is not used in the article.	FR-4585
840.2, Network Terminal	Revised to correlate with the expanded scope for other types broadband communications systems.	FR-4586
840.2, Premises Community Antenna Television (CATV) Circuit	Revised to correlate with the expanded scope for other types broadband communications systems.	FR-4623
840.3(B)	Revised to include references to 770.3(B), 800.3(B), and 820.3(B) to correlate with the expanded scope for other types broadband communications systems.	FR-4624
840.3(E)(4), Informational Note	Added informational note to reference 725.121.	FR-4625
840.2, Premises Communications Circuit	Revised to correlate with the expanded scope for other types broadband communications systems.	FR-4622
840.3(F)	Added section to reference other Chapter 8 article requirements.	FR-4626
840.3(G)	Added section to reference 725.139(D)(1) and 800.133(A)(1)(c) for additional installation requirements.	FR-4627
840.44	Revised to add “aerial” to correlate with Articles 800, 820, and 830.	FR-4629
840.45	Added section to address requirements for overhead (aerial) communications wires and cables.	FR-4631
840.46	Added section to address requirements for overhead (aerial) coaxial cables.	FR-4631

(continues)

Section	Comments	FR/SR/SCR Reference
840.47	Revised to replace “optical fiber” with “wires” to correlate with the expanded scope for other types broadband communications systems.	FR-4632
840.47(A)	Revised to provide separate requirements for optical fiber installations to correlate with the expanded scope for other types broadband communications systems.	FR-4632
840.47(B)	Added section for communications wire and cable to correlate with the expanded scope for other types broadband communications systems.	FR-4632
840.47(C)	Added section for coaxial cable to correlate with the expanded scope for other types broadband communications systems.	FR-4632
840.48	Revised to correlate with the expanded scope for other types broadband communications systems.	FR-4633
840.48(A)	Added section for optical fiber cable to correlate with the expanded scope for other types broadband communications systems.	FR-4633
840.48(B)	Added section for communications wire and cable to correlate with the expanded scope for other types broadband communications systems.	FR-4633
840.48(C)	Added section for coaxial cable to correlate with the expanded scope for other types broadband communications systems.	FR-4633
840.49	Revised to add references to 800.49 and 820.49 to correlate with the expanded scope for other types broadband communications systems.	FR-4634
840.93(C)	Revised to replace “ONT (optical network terminal)” with “network terminal” to correlate with the expanded scope for other types broadband communications systems.	FR-4635
840.100	Revised to replace “ONT (optical network terminal)” with “network terminal” to correlate with the expanded scope for other types broadband communications systems.	SR-4560
840.101	Revised to replace “ONT (optical network terminal)” with “network terminal” to correlate with the expanded scope for other types broadband communications systems.	FR-4637
840.106	Revised to replace “ONT (optical network terminal)” with “network terminal” to correlate with the expanded scope for other types broadband communications systems.	FR-4638
840.100	Revised to add cable routing assemblies to the section title.	FR-4639
840.110(A)	Added section for optical fiber cable to correlate with the expanded scope for other types broadband communications systems.	FR-4639
840.110(B)	Added section for multipair communications cables to correlate with the expanded scope for other types broadband communications systems.	FR-4639
840.110(C)	Added section for coaxial cable to correlate with the expanded scope for other types broadband communications systems.	FR-4639
840.113	Revised to add twisted pair-based and coaxial cable-based systems and to replace “ONT (optical network terminal)” with “network terminal” to correlate with the expanded scope for other types broadband communications systems.	FR-4640
840.154	Revised to remove raceways in the title to correlate with 770.154 only addressing the applications of listed optical fiber cables.	FR-4642
Article 840, Part VI	Added Part VI, which contains requirements for power over Ethernet (PoE) and other powering systems that provide power over data communications cables.	FR-4643
840.160	Added section to include a reference to 725.144 for power delivery circuits that exceed 60 watts on communications cables.	SR-4564
840.170(A)	Revised to replace ONT (optical network terminal) with network terminal to correlate with the expanded scope for other types of broadband communications systems.	FR-4644
840.170(C)	Revised to replace the title of “Premises Communications Circuits” with “Communications Equipment,” to replace ONT (optical network terminal) with network terminal, and to add a requirement for listing in accordance with 800.170.	SR-4565
840.170(D)	Added section requiring cable routing assemblies and communications raceways to be listed in accordance with 800.182.	FR-4644

Section	Comments	FR/SR/SCR Reference
840.170(E)	Added section requiring communications wires and cable to be listed and marked in accordance with 800.179.	FR-4644
840.170(F)	Revised to replace ONT (optical network terminal) with network terminal to correlate with the expanded scope for other types broadband communications systems.	FR-4644
840.170(G)	Added section to provide listing requirements for circuits intended to provide power over communications cables.	FR-4644
Chapter 9		
Table 1, Note 9	Revised to clarify application conduit or tubing fill where single conductors are installed as an assembly.	FR-2126
Table 4, Article 356, LFNC-A, B, and C	Added tables for Type liquidtight flexible nonmetallic conduit (LFNC-A, B, and C) and note to each table referencing 356.2.	FR-2127
Informative Annex B		
B.310.15(B)(7)	Revised notes to correlate with notes in 310.15 tables.	FR-1512
Informative Annex C		
Annex C	Added Table C.7 and Table C.7(A) to identify fills for LFNC-C for both concentrically stranded conductors and compact conductors.	FR-2128
Informative Annex D		
Example D3	Revised to correct the calculated load to reflect only the requirements of Article 220.	FR-341
Example D7	Revised to include a comparison of the minimum conductor ampacity when corrected for elevated ambient temperature and to add a table with minimum permitted conductor sizes without ampacity correction or adjustment for service and feeder ratings of 100 through 400 amperes.	FR-1513 and SCR-37
Example D8	Revised to add examples for nontime-delay fuse and inverse time circuit breaker.	SR-3007
Informative Annex F		
Annex F, Part I	Revised to correct an equation.	FR-7526

Notice to Users

Throughout this handbook, the commentary text is printed in blue type to distinguish it from the *Code* text. Note that the commentary is not part of the *Code* and therefore is not enforceable.

90.1 Purpose.

(A) Practical Safeguarding. The purpose of this *Code* is the practical safeguarding of persons and property from hazards arising from the use of electricity. This *Code* is not intended as a design specification or an instruction manual for untrained persons.

The *National Electrical Code*® (*NEC*®) is prepared by the National Electrical Code Committee, which consists of a correlating committee and 19 code-making panels. The code-making panels have specific technical responsibilities. The scope of the committee is as follows:

This committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

In addition to its overall responsibility for the *National Electrical Code*, the Correlating Committee on National Electrical Code is responsible for correlation of the following documents:

1. NFPA 70B, *Recommended Practice for Electrical Equipment Maintenance*
2. NFPA 70E®, *Standard for Electrical Safety in the Workplace*®
3. NFPA 73, *Standard for Electrical Inspections for Existing Dwellings*
4. NFPA 79, *Electrical Standard for Industrial Machinery*
5. NFPA 110, *Standard for Emergency and Standby Power Systems*
6. NFPA 111, *Standard on Stored Electrical Energy Emergency and Standby Power Systems*
7. NFPA 790, *Standard for Competency of Third-Party Field Evaluation Bodies*
8. NFPA 791, *Recommended Practice and Procedures for Unlabeled Electrical Equipment Evaluation*

(B) Adequacy. This *Code* contains provisions that are considered necessary for safety. Compliance therewith and proper maintenance result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use.

Informational Note: Hazards often occur because of overloading of wiring systems by methods or usage not in conformity with this *Code*. This occurs because initial wiring did not provide for increases in the use of electricity. An initial adequate installation and reasonable provisions for system changes provide for future increases in the use of electricity.

Consideration should always be given to future expansion of the electrical system. Future expansion might be unlikely in some occupancies. In

other occupancies, it may be cost effective to plan for future additions, alterations, or designs during initial installation.

(C) Relation to Other International Standards. The requirements in this *Code* address the fundamental principles of protection for safety contained in Section 131 of International Electrotechnical Commission Standard 60364-1, *Electrical Installations of Buildings*.

Informational Note: IEC 60364-1, Section 131, contains fundamental principles of protection for safety that encompass protection against electric shock, protection against thermal effects, protection against overcurrent, protection against fault currents, and protection against overvoltage. All of these potential hazards are addressed by the requirements in this *Code*.

In addition to being an essential part of the safety system of the Americas and the most widely adopted code for the built environment in the United States, the *NEC* is also adopted and used extensively in many other countries. The *NEC* is compatible with international safety principles, and installations meeting the requirements of the *NEC* are also in compliance with the fundamental principles outlined in IEC 60364-1, *Electrical Installations of Buildings*, Section 131. Countries that do not have formalized rules for electrical installations can adopt the *NEC* and be fully compatible with the safety principles of IEC 60364-1, Section 131.

90.2 Scope.

(A) Covered. This *Code* covers the installation and removal of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following:

- (1) Public and private premises, including buildings, structures, mobile homes, recreational vehicles, and floating buildings
- (2) Yards, lots, parking lots, carnivals, and industrial substations
- (3) Installations of conductors and equipment that connect to the supply of electricity
- (4) Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center

Often, the source of supply is the serving electric utility. The point of connection from a premises wiring system to a serving electric utility system is referred to as the *service point*. The conductors on the premises side of the service point are referred to as *service conductors*. See [Article 100](#) for these definitions.

The source may be a stand-alone system, such as a generator, a battery system, a photovoltaic system, a fuel cell, a wind turbine, or a combination of those sources. Conductors from stand-alone systems are not service conductors, they are feeders. Service conductors are only supplied by a utility source.

See also

Article 230 for service conductor and service equipment requirements, where the only source of supply of electricity is from a utility
Article 705, where the source of supply includes a utility source(s) in combination with alternate energy sources

EXHIBIT 90.1 A conventional generating plant, which is governed by the *National Electrical Safety Code* (top); a support facility that is subject to *NEC* requirements (bottom).

Exhibit 90.1 illustrates the distinction between electric utility facilities to which the *NEC* applies and those to which it does not apply. The electrical equipment in the generating plant is not governed by the rules of the *NEC*. The warehouse is a typical commercial facility in which the electrical installation would be governed by the rules of the *NEC*, regardless of its ownership. Office buildings and warehouses of electric utilities are functionally similar to like facilities owned by other commercial entities.

Industrial and multibuilding complexes and campus-style complexes often include substations and other installations that employ construction and wiring similar to those of electric utility installations. Because these installations are on the load side of the service point, they are within the purview of the *NEC*. At an increasing number of industrial, institutional, and other campus-style distribution systems, the service point is at an owner-maintained substation, and the conductors extending from that substation to the campus facilities are *feeders* (see [Article 100](#)). *NEC* requirements cover these distribution systems in [225.60](#) and [225.61](#) and in [Article 399](#). These overhead conductor and live parts clearance requirements in the *NEC* correlate with those in ANSI C2, *National Electrical Safety Code*® (*NESC*), for overhead conductors under the control of an electric utility.

This section was revised for the 2017 edition to note that the *NEC* also addresses removal of equipment, such as abandoned conductors. Abandoned conductors and cables from several generations of equipment can increase the fire loading in a building. Abandoned cable is

most commonly found where communications systems or computer networks have been upgraded. A number of places in the *NEC* specify where abandoned cable is required to be removed.

(B) Not Covered. This *Code* does not cover the following:

- (1) Installations in ships, watercraft other than floating buildings, railway rolling stock, aircraft, or automotive vehicles other than mobile homes and recreational vehicles

Informational Note: Although the scope of this *Code* indicates that the *Code* does not cover installations in ships, portions of this *Code* are incorporated by reference into Title 46, Code of Federal Regulations, Parts 110–113.

- (2) Installations underground in mines and self-propelled mobile surface mining machinery and its attendant electrical trailing cable
- (3) Installations of railways for generation, transformation, transmission, energy storage, or distribution of power used exclusively for operation of rolling stock or installations used exclusively for signaling and communications purposes
- (4) Installations of communications equipment under the exclusive control of communications utilities located outdoors or in building spaces used exclusively for such installations
- (5) Installations under the exclusive control of an electric utility where such installations
 - a. Consist of service drops or service laterals, and associated metering, or
 - b. Are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, energy storage, or distribution of electric energy, or
 - c. Are located in legally established easements or rights-of-way, or
 - d. Are located by other written agreements either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations. These written agreements shall be limited to installations for the purpose of communications, metering, generation, control, transformation, transmission, energy storage, or distribution of electric energy where legally established easements or rights-of-way cannot be obtained. These installations shall be limited to federal lands, Native American reservations through the U.S. Department of the Interior Bureau of Indian Affairs, military bases, lands controlled by port authorities and state agencies and departments, and lands owned by railroads.

Informational Note to (4) and (5): Examples of utilities may include those entities that are typically designated or recognized by governmental law or regulation by public service/utility commissions and that install, operate, and maintain electric supply (such as generation, transmission, or distribution systems) or communications systems (such as telephone, CATV, Internet, satellite, or data services). Utilities may be subject to compliance

with codes and standards covering their regulated activities as adopted under governmental law or regulation. Additional information can be found through consultation with the appropriate governmental bodies, such as state regulatory commissions, the Federal Energy Regulatory Commission, and the Federal Communications Commission.

Section 90.2(B)(5) is not intended to prevent the *NEC* from being used as an installation regulatory document for these types of installations. The *NEC* is fully capable of being utilized for electrical installations in most cases. Rather, 90.2(B)(5) lists specific areas where the nature of the installation requires specialized rules or where other installation rules, standards, and guidelines have been developed for specific uses and industries. For example, the electric utility industry uses the *National Electrical Safety Code (NESC)* as its primary requirement in the generation, transmission, distribution, and metering of electric energy. See Exhibit 90.1 for examples of electric utility facilities covered or not covered by the *NEC*. In most cases, utility-owned installations are on legally established easements or rights of way. Easements or rights of way may not be available on federally owned lands, Native American reservations, military bases, lands controlled by port authorities or state agencies or departments, and lands owned by railroads. In these limited applications, a written agreement complying with this section may be used to establish the extent of the utility installation.

Article 706, Energy Storage Systems, was introduced in the 2017 edition of the *NEC*. This section was revised for this edition to note that utility installations of energy storage are outside of the scope of the *NEC*. Utility-owned energy storage would be covered by the *NESC*. Energy storage that is not under the exclusive control of an electric utility would be governed by the *NEC*.

(C) Special Permission. The authority having jurisdiction for enforcing this *Code* may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service conductors of the premises served, provided such installations are outside a building or structure, or terminate inside at a readily accessible location nearest the point of entrance of the service conductors.

90.3 Code Arrangement. This *Code* is divided into the introduction and nine chapters, as shown in Figure 90.3. Chapters 1, 2, 3, and 4 apply generally. Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions and may supplement or modify the requirements in Chapters 1 through 7.

Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8.

Chapter 9 consists of tables that are applicable as referenced.

Informative annexes are not part of the requirements of this *Code* but are included for informational purposes only.

An example of how the general rules of Chapter 3 are modified is 300.22, which is modified by 725.3(C) and 760.3(B) and is specifically referenced in 800.3(B), 820.3(C), and 830.3(B). Figure 90.3 is a graphic explanation of the *NEC* arrangement.

The 2017 edition was revised to clarify that the requirements in Chapters 5 through 7 can modify the requirements in Chapters 1

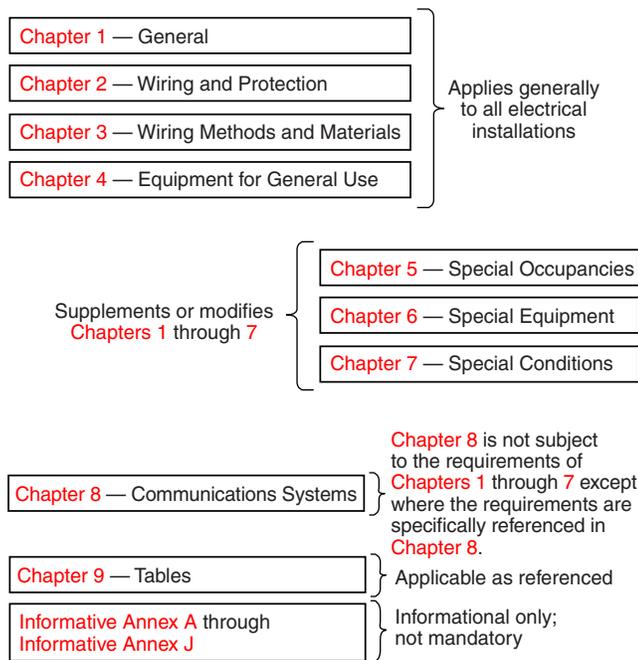

FIGURE 90.3 Code Arrangement.

through 7. Previously, these latter chapters could only modify the requirements in Chapters 1 through 4.

90.4 Enforcement. This Code is intended to be suitable for mandatory application by governmental bodies that exercise legal jurisdiction over electrical installations, including signaling and communications systems, and for use by insurance inspectors. The authority having jurisdiction for enforcement of the Code has the responsibility for making interpretations of the rules, for deciding on the approval of equipment and materials, and for granting the special permission contemplated in a number of the rules.

All materials and equipment used under the requirements of the Code are subject to the approval of the AHJ. Sections 90.7, 110.2, and 110.3, along with the definitions of the terms *approved*, *identified (as applied to equipment)*, *labeled*, and *listed*, are intended to provide a basis for the AHJ to make judgments about the approval of an installation. The phrase “including signaling and communications systems” emphasizes that these systems are also subject to enforcement.

Some localities do not adopt the NEC, but, even in those localities, installations that comply with the current NEC are prima facie evidence that the electrical installation is safe.

By special permission, the authority having jurisdiction may waive specific requirements in this Code or permit alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.

The AHJ is responsible for interpreting the NEC. Using special permission (written consent), the AHJ may permit alternative methods where specific rules are not established in the NEC. For example, the AHJ may waive

specific requirements in industrial occupancies, research and testing laboratories, and other occupancies where the specific type of installation is not covered in the NEC.

This Code may require new products, constructions, or materials that may not yet be available at the time the Code is adopted. In such event, the authority having jurisdiction may permit the use of the products, constructions, or materials that comply with the most recent previous edition of this Code adopted by the jurisdiction.

The AHJ may waive a new NEC requirement during the interim period between acceptance of a new edition of the NEC and the availability of a new product, construction, or material redesigned to comply with the level of safety required by the latest edition. Establishing a viable future effective date in each section of the NEC is difficult because the time needed to change existing products and standards or to develop new materials and test methods usually is not known at the time the latest edition is adopted.

90.5 Mandatory Rules, Permissive Rules, and Explanatory Material.

(A) Mandatory Rules. Mandatory rules of this Code are those that identify actions that are specifically required or prohibited and are characterized by the use of the terms *shall* or *shall not*.

(B) Permissive Rules. Permissive rules of this Code are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the terms *shall be permitted* or *shall not be required*.

Permissive rules are options or alternative methods of achieving equivalent safety — they are not requirements. Permissive rules are often misinterpreted. For example, the frequently used permissive term *shall be permitted* can be mistaken for a requirement. Substituting “the inspector must allow [item A or method A]” for “[item A or method A] shall be permitted” generally clarifies the interpretation.

(C) Explanatory Material. Explanatory material, such as references to other standards, references to related sections of this Code, or information related to a Code rule, is included in this Code in the form of informational notes. Such notes are informational only and are not enforceable as requirements of this Code.

Brackets containing section references to another NFPA document are for informational purposes only and are provided as a guide to indicate the source of the extracted text. These bracketed references immediately follow the extracted text.

A number of requirements in the NEC have been extracted from other NFPA codes and standards. Although NEC requirements based on extracted material are under the jurisdiction of the technical committee responsible for the particular document from which the material was extracted, 90.5(C) clarifies that the NEC requirements stand on their own as part of the NEC. The extracted material with bracketed references does not indicate that other NFPA documents are adopted through reference.

The NEC contains a number of informational notes. Prior to the 2011 edition, these notes were referred to as *fine print notes* or *FPNs*.

They were renamed *informational notes* to clarify that they do not contain requirements, statements of intent, or recommendations. They present additional supplementary material that aids in the application of the requirement they follow. Because informational notes are not requirements of the *NEC*, they are not enforceable.

Footnotes to tables, although also in fine print, are not explanatory material unless they are identified as informational notes. Table footnotes are part of the tables and are necessary for proper use of the tables. Therefore, they are mandatory and enforceable.

Additional explanatory material is located in the informative annexes. The term *informative annex* clarifies that these annexes contain additional information and do not contain recommendations or requirements.

Informational Note: The format and language used in this *Code* follows guidelines established by NFPA and published in the *NEC Style Manual*. Copies of this manual can be obtained from NFPA.

The *National Electrical Code® Style Manual* can be downloaded from the NFPA website at http://www.nfpa.org/assets/files/AboutTheCodes/70/NEC_StyleManual_2015.pdf.

(D) Informative Annexes. Nonmandatory information relative to the use of the *NEC* is provided in informative annexes. Informative annexes are not part of the enforceable requirements of the *NEC*, but are included for information purposes only.

90.6 Formal Interpretations. To promote uniformity of interpretation and application of the provisions of this *Code*, formal interpretation procedures have been established and are found in the NFPA Regulations Governing Committee Projects.

The procedures for Formal Interpretations of the *NEC* are outlined in Section 6 of the NFPA Regulations Governing the Development of NFPA Standards (formerly the Regulations Governing Committee Projects). These regulations are included in the *NFPA Standards Directory*, which is published annually and can be downloaded from the NFPA website.

The National Electrical Code Committee is not responsible for subsequent actions of authorities enforcing the *NEC* that accept or reject its findings. The AHJ is responsible for interpreting *NEC* rules and should attempt to resolve all disagreements at the local level. Two general forms of Formal Interpretations are recognized: (1) those that are interpretations of the literal text, and (2) those that are interpretations of the intent of the committee at the time the particular text was issued.

Interpretations of the *NEC* not subject to processing are those that involve one of the following:

1. A determination of compliance of a design, installation, product, or equivalency of protection
2. A review of plans or specifications or judgment or knowledge that can be acquired only as a result of on-site inspection
3. Text that clearly and decisively provides the requested information
4. Subjects not previously considered by the technical committee or not addressed in the document

Formal Interpretations of *NEC* rules are published in several venues, including *NFPA News*, *NFPA Codes Online.org* (the *National Fire Codes®* subscription service), the NFPA doc info page (www.nfpa.org/70), and various trade publications.

Most requests for interpretation do not qualify for processing as a Formal Interpretation in accordance with NFPA Regulations Governing the Development of NFPA Standards. NFPA staff can often provide an informal interpretation. Informal interpretations are the personal opinions of the author and do not necessarily represent the official position of NFPA or the National Electrical Code Committee.

90.7 Examination of Equipment for Safety. For specific items of equipment and materials referred to in this *Code*, examinations for safety made under standard conditions provide a basis for approval where the record is made generally available through promulgation by organizations properly equipped and qualified for experimental testing, inspections of the run of goods at factories, and service-value determination through field inspections. This avoids the necessity for repetition of examinations by different examiners, frequently with inadequate facilities for such work, and the confusion that would result from conflicting reports on the suitability of devices and materials examined for a given purpose.

It is the intent of this *Code* that factory-installed internal wiring or the construction of equipment need not be inspected at the time of installation of the equipment, except to detect alterations or damage, if the equipment has been listed by a qualified electrical testing laboratory that is recognized as having the facilities described in the preceding paragraph and that requires suitability for installation in accordance with this *Code*. Suitability shall be determined by application of requirements that are compatible with this *Code*.

Informational Note No. 1: See requirements in **110.3**.

Informational Note No. 2: *Listed* is defined in **Article 100**.

Informational Note No. 3: **Informative Annex A** contains a list of product safety standards that are compatible with this *Code*.

Testing laboratories, inspection agencies, and other organizations concerned with product evaluation publish lists of equipment and materials that have been tested and meet nationally recognized standards or that have been found suitable for use in a specified manner. The *NEC* does not contain detailed information on equipment or materials but refers to products as *listed*, *labeled*, or *identified*. See **Article 100** for these definitions. Many certification agencies also perform field evaluations of specific installations in order to render an opinion on compliance with the *code* requirements along with any applicable product standards. NFPA 790, *Standard for Competency of Third-Party Field Evaluation Bodies*, provides requirements for the qualification and competence of a body performing field evaluations on electrical products and assemblies with electrical components. NFPA 791, *Recommended Practice and Procedures for Unlabeled Electrical Equipment Evaluation*, covers recommended procedures for evaluating unlabeled electrical equipment for compliance with nationally recognized standards and with any requirements of the AHJ.

NFPA does not approve, inspect, or certify any installations, procedures, equipment, or materials, nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment, or materials, the AHJ may base acceptance on compliance with NFPA or other appropriate standards. The AHJ may also

refer to the listing or labeling practices of an organization concerned with product evaluations in order to determine compliance with appropriate standards.

Informative Annex A contains a list of product safety standards used for product listing. The list includes only product safety standards for which a listing is required by the *NEC*. For example, **344.6** requires that rigid metal conduit, Type RMC, be listed. By using **Informative Annex A**, the user finds that the listing standard for rigid metal conduit is UL 6, *Electrical Rigid Metal Conduit — Steel*. Because associated conduit fittings are required to be listed, UL 514B, *Conduit, Tubing, and Cable Fittings*, is found in **Informative Annex A** also.

90.8 Wiring Planning.

(A) Future Expansion and Convenience. Plans and specifications that provide ample space in raceways, spare raceways, and additional spaces allow for future increases in electric power and communications circuits. Distribution centers located in readily accessible locations provide convenience and safety of operation.

The requirement for providing the exclusively dedicated equipment space mandated by **110.26(E)** supports the intent of **90.8(A)** regarding future increases in the use of electricity. Communications circuits are important to consider when planning for future needs. Electrical distribution centers should contain additional space and capacity for future additions and should be located for easy accessibility. In commercial and industrial facilities, a common practice is to purchase switchboards with additional capacity to accommodate future expansion, as shown in **Exhibit 90.2**.

(B) Number of Circuits in Enclosures. It is elsewhere provided in this *Code* that the number of circuits confined in a single enclosure be varyingly restricted. Limiting the number of circuits in a single enclosure minimizes the effects from a short circuit or ground fault.

90.9 Units of Measurement.

(A) Measurement System of Preference. For the purpose of this *Code*, metric units of measurement are in accordance with the modernized metric system known as the International System of Units (SI).

Most U.S. industries that do business abroad are predominantly metric because of global sourcing of parts, service, components, and production. However, many domestic industries still use U.S. customary units (sometimes referred to as inch-pound units). Metric dimensions are beginning to appear in the domestic building construction industry because the national standards are being harmonized with international standards. The *NEC* permits distance measurements using either method.

(B) Dual System of Units. SI units shall appear first, and inch-pound units shall immediately follow in parentheses. Conversion from inch-pound units to SI units shall be based on hard conversion except as provided in **90.9(C)**.

(C) Permitted Uses of Soft Conversion. The cases given in **90.9(C)(1)** through **(C)(4)** shall not be required to use hard conversion and shall be permitted to use soft conversion.

EXHIBIT 90.2 A switchboard with spare circuit breakers installed to facilitate future growth. (Courtesy of the International Association of Electrical Inspectors)

(1) Trade Sizes. Where the actual measured size of a product is not the same as the nominal size, trade size designators shall be used rather than dimensions. Trade practices shall be followed in all cases.

In *NEC* raceway articles, metric designators (metric trade sizes) of conduits precede the trade size equivalents. For example, in **350.20(A)**, the size requirement is stated as follows: “LFMC smaller than metric designator 16 (trade size ½) shall not be used.”

(2) Extracted Material. Where material is extracted from another standard, the context of the original material shall not be compromised or violated. Any editing of the extracted text shall be confined to making the style consistent with that of the *NEC*.

(3) Industry Practice. Where industry practice is to express units in inch-pound units, the inclusion of SI units shall not be required.

(4) Safety. Where a negative impact on safety would result, soft conversion shall be used.

(D) Compliance. Conversion from inch-pound units to SI units shall be permitted to be an approximate conversion. Compliance with the numbers shown in either the SI system or the inch-pound system shall constitute compliance with this *Code*.

Informational Note No. 1: Hard conversion is considered a change in dimensions or properties of an item into new sizes that might or might not be interchangeable with the sizes used in the original measurement. Soft conversion is considered a direct mathematical conversion and involves a change in the description of an existing measurement but not in the actual dimension.

Informational Note No. 2: SI conversions are based on IEEE/ASTM SI 10-1997, *Standard for the Use of the International System of Units (SI): The Modern Metric System*.

Soft conversions are numerically accurate. Hard conversions are rounded or approximate values of the customary unit dimension. Soft conversions are required when an approximation would negatively impact safety. **Commentary Table 90.1** offers some examples of the hard conversion process. The conversion of the equivalent U.S. customary units into

metric equivalents shows the small variance between soft conversion and hard conversion units.

COMMENTARY TABLE 90.1 Conversions Using the Hard Conversion Method

U.S. Customary Units	Soft Conversions to SI Units	Hard Conversions to SI Units	Equivalent U.S. Customary Units
½ in.	12.7 mm	13 mm	0.51 in.
¾ in.	19.05 mm	19 mm	0.75 in.
1 in.	25.4 mm	25 mm	0.98 in.
4 in.	102 mm	100 mm	3.94 in.
12 in.	305 mm	300 mm	11.81 in.
2 ft	610 mm	600 mm	1.97 ft
3 ft	914 mm	900 mm	2.95 ft
6 ft	1.83 m	1.8 m	5.91 ft
15 ft	4.57 m	4.5 m	14.76 ft

General

ARTICLE

100 Definitions

Contents

Part I. General

Part II. Over 1000 Volts, Nominal

Scope. This article contains only those definitions essential to the application of this *Code*. It is not intended to include commonly defined general terms or commonly defined technical terms from related codes and standards. In general, only those terms that are used in two or more articles are defined in **Article 100**. Other definitions are included in the article in which they are used but may be referenced in **Article 100**.

Part I of this article contains definitions intended to apply wherever the terms are used throughout this *Code*. **Part II** contains definitions applicable to installations and equipment operating at over 1000 volts, nominal.

The *NEC* defines a number of technical terms in order to provide a common understanding of their use in the *NEC*. Some definitions are not listed in **Article 100** but are included in the *NEC* article in which the term is used. For articles that follow the common format according to the *NEC Style Manual*, the section number is generally XXX.2 Definition(s). For example, the definition of *nonmetallic-sheathed cable* is found in **334.2**.

The *NEC* does not define every term used. General terms are found in non-technical dictionaries. Some technical terms are used as defined in *IEEE 100, The Authoritative Dictionary of IEEE Standards Terms*. It is also important to note that there are many terms used in the electrical trades that are actually registered trademarks for a specific product or line of products. Trademark terms are not used in the *NEC* or this handbook.

Part I. General

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means. (CMP-1)

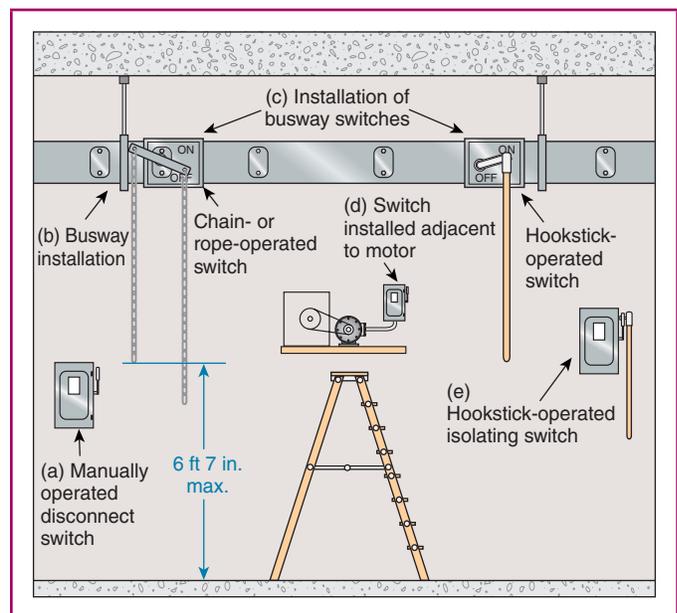

EXHIBIT 100.1 An example of a busway and of switches considered accessible even if located above the 6 feet 7 inch maximum height of the switch handle specified in **404.8(A)**.

Exhibit 100.1 illustrates equipment considered accessible (as applied to equipment) in accordance with requirements elsewhere in the *NEC*. The requirement for the accessibility of switches and circuit breakers used as switches is shown in (a) and is according to **404.8(A)**. In (b), the busway installation is according to **368.17(C)**. The exceptions to **404.8(A)** are illustrated as follows: in (c), busway switches installed according to Exception No. 1; in (d), a switch installed adjacent to a motor according to Exception No. 2; and in (e), a hookstick-operated isolating switch installed according to Exception No. 3.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building. (CMP-1)

Wiring methods located behind removable panels designed to allow access are not considered permanently enclosed and are considered

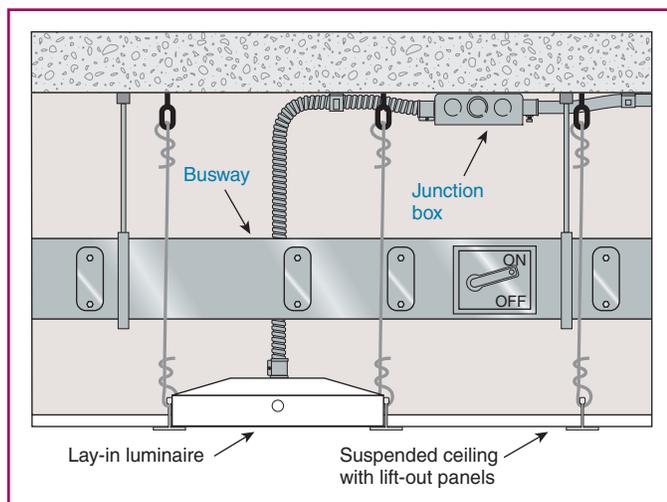

EXHIBIT 100.2 An example of an accessible busway and junction box located above hung ceilings with lift-out panels.

exposed (as applied to wiring methods). Exhibit 100.2 is an example of wiring methods and equipment that are considered accessible despite being located above a suspended ceiling.

See also

300.4(C) regarding cables located in spaces behind accessible panels

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to take actions such as to use tools (other than keys), to climb over or under, to remove obstacles, or to resort to portable ladders, and so forth. (CMP 1)

Informational Note: Use of keys is a common practice under controlled or supervised conditions and a common alternative to the ready access requirements under such supervised conditions as provided elsewhere in the NEC.

Locks are commonly used on electrical equipment and electrical equipment rooms to keep unauthorized persons away from electrical hazards and to prevent tampering. The definition of *readily accessible* does not preclude using locks on service equipment doors or doors of rooms containing service equipment, provided a key or lock combination is available to those for whom ready access is necessary. If a tool is necessary to gain access, the equipment is not readily accessible. Exhibit 100.3 shows an example of a locked electrical equipment door with a warning sign that restricts access.

Sections 230.70(A)(1) and 230.205(A) require service disconnecting means to be readily accessible. However, 230.205(A) permits a mechanical linkage or an electronically actuated switch to provide an equivalent to access.

Adjustable Speed Drive. Power conversion equipment that provides a means of adjusting the speed of an electric motor. (CMP-11)

Informational Note: A variable frequency drive is one type of electronic adjustable speed drive that controls the rotational speed

EXHIBIT 100.3 A warning sign on a locked electrical equipment door.

of an ac electric motor by controlling the frequency and voltage of the electrical power supplied to the motor.

Adjustable Speed Drive System. A combination of an adjustable speed drive, its associated motor(s), and auxiliary equipment. (CMP-11)

Ampacity. The maximum current, in amperes, that a conductor can carry continuously under the conditions of use without exceeding its temperature rating. (CMP-6)

Conditions of use include factors such as ambient temperature and the number of conductors in the cable or raceway. A conductor with insulation rated at 60°C and installed near a furnace where the ambient temperature is continuously maintained at 60°C has no current-carrying capacity. Any current flowing through the conductor will raise its temperature above the 60°C insulation rating. Therefore, the ampacity of this conductor, regardless of its size, is zero.

Additional conductors in a raceway or cable raises the temperature in the raceway, decreasing the available ampacity. [See 310.15(B)(3)(a).]

See also

Table 310.15(B)(2)(a), Table 310.15(B)(2)(b), and Informative Annex B for the ampacity correction factors for temperature **310.15(B)(2)** and its commentary for more on the temperature limitation of conductors

Appliance. Utilization equipment, generally other than industrial, that is normally built in standardized sizes or types and is installed or connected as a unit to perform one or more functions such as clothes washing, air-conditioning, food mixing, deep frying, and so forth. (CMP-17)

Approved. Acceptable to the authority having jurisdiction. (CMP-1)

Typically, approval of listed equipment is more readily given by an authority having jurisdiction (AHJ) if the authority accepts a laboratory's

listing mark. Other options may be available for the jurisdiction to approve equipment, including evaluation by the inspection authority or field evaluation by a qualified laboratory or individual. Where an evaluation is conducted on site, industry standards such as NFPA 79, *Electrical Standard for Industrial Machinery*, if applicable, can be used. NFPA 790, *Standard for Competency of Third-Party Field Evaluation Bodies*, can be used to qualify evaluation services. NFPA 791, *Recommended Practice and Procedures for Unlabeled Electrical Equipment Evaluation*, can be used to evaluate unlabeled equipment in accordance with nationally recognized standards and any requirements of the AHJ.

The definition of *authority having jurisdiction (AHJ)* and both 110.2 and 110.3 provide more information on the approval process. See the definitions of *field evaluation body* and *field labeled* for information on this option for product approval by the AHJ.

Arc-Fault Circuit Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected. (CMP-2)

Arc-fault circuit interrupters are evaluated in accordance with UL 1699, *Standard for Arc-Fault Circuit-Interrupters*, using testing methods that create or simulate arcing conditions to determine a product's ability to detect and interrupt arcing faults. AFCIs are also tested to verify that arc detection is not inhibited by the presence of loads and circuit characteristics that mask the hazardous arcing condition. In addition, these devices are evaluated to determine resistance to unwanted tripping due to the presence of arcing that occurs in equipment under normal operating conditions or to a loading condition that closely mimics an arcing fault, such as a solid-state electronic ballast or a dimmed load.

Askarel. A generic term for a group of nonflammable synthetic chlorinated hydrocarbons used as electrical insulating media. (CMP-9)

Informational Note: Askarels of various compositional types are used. Under arcing conditions, the gases produced, while consisting predominantly of noncombustible hydrogen chloride, can include varying amounts of combustible gases, depending on the askarel type.

Associated Apparatus [as applied to Hazardous (Classified) Locations]. Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affects the energy in the intrinsically safe circuits and is relied on to maintain intrinsic safety. Such apparatus is one of the following:

- (1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location

(CMP-14)

Informational Note No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.

Informational Note No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to

limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.

Associated Nonincendive Field Wiring Apparatus [as applied to Hazardous (Classified) Locations]. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Such apparatus are one of the following:

- (1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location

(CMP-14)

Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Attachment Plug (Plug Cap) (Plug). A device that, by insertion in a receptacle, establishes a connection between the conductors of the attached flexible cord and the conductors connected permanently to the receptacle. (CMP-18)

See NEMA WD 6, *Wiring Devices — Dimensional Requirements*, for the standard attachment plug configurations.

Authority Having Jurisdiction (AHJ). An organization, office, or individual responsible for enforcing the requirements of a code or standard, or for approving equipment, materials, an installation, or a procedure. (CMP-1)

Informational Note: The phrase “authority having jurisdiction,” or its acronym AHJ, is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

In the North American safety system, the importance of the AHJ's role cannot be overstated. The AHJ verifies that an installation complies with the NEC. See the definition of *approved*.

See also

90.7, 110.2, and 110.3 for more information

Automatic. Performing a function without the necessity of human intervention. (CMP-1)

Bathroom. An area including a basin with one or more of the following: a toilet, a urinal, a tub, a shower, a bidet, or similar plumbing fixtures. (CMP-2)

Battery System. Interconnected battery subsystems consisting of one or more storage batteries and battery chargers, and can include inverters, converters, and associated electrical equipment. (CMP-13)

Bonded (Bonding). Connected to establish electrical continuity and conductivity.

Bonding Conductor or Jumper. A reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected. (CMP-5)

Either of the two terms *bonding conductor* or *bonding jumper* may be used. The term *bonding jumper* is sometimes interpreted to mean a short conductor, although some bonding jumpers may be several feet in length. The primary purpose of a bonding conductor or jumper is to ensure electrical conductivity between two conductive bodies, such as between a box and a metal raceway. Bonding jumpers are particularly important where a box has either concentric- or eccentric-type knockouts. These knockouts can impair the electrical conductivity between metal parts and may actually introduce unnecessary impedance into the grounding path.

Exhibit 100.4 shows the difference between concentric- and eccentric-type knockouts and illustrates one method of applying bonding jumpers at these types of knockouts.

See also

250.92(B) for bonding jumpers at service equipment

250.97 for bonding jumpers at equipment operating over 250 volts

250.98 for bonding jumpers at expansion fittings in metal raceways

Bonding Jumper, Equipment. The connection between two or more portions of the equipment grounding conductor. (CMP-5)

Equipment bonding jumpers ensure that an effective ground-fault current path is not compromised by an interruption in mechanical or electrical continuity. For example, conduits entering an open-bottom switchboard are usually not mechanically connected to the switchboard. Expansion fittings may not provide electrical continuity because they are loosely joined raceways. Bonding jumpers are necessary in order to provide electrical continuity.

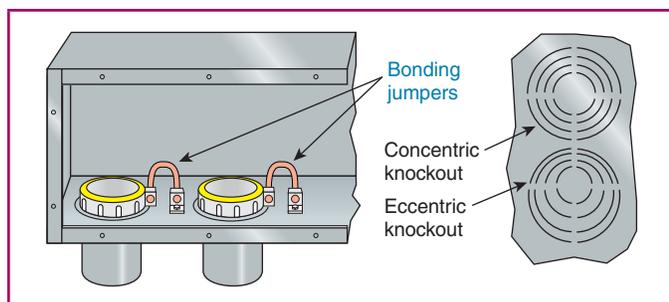

EXHIBIT 100.4 Bonding jumpers installed around concentric or eccentric knockouts.

EXHIBIT 100.5 Equipment bonding jumpers installed to maintain electrical continuity around conduit expansion fittings. (Courtesy of the International Association of Electrical Inspectors)

Exhibit 100.5 shows an external bonding jumper around an expansion joint. Some expansion fittings for metal conduit have an internal bonding jumper that is integral to the fitting. Equipment bonding jumpers are also used to connect the grounding terminal of a receptacle to a metal box that in turn is grounded via an equipment grounding conductor (the raceway system).

Bonding Jumper, Main. The connection between the grounded circuit conductor and the equipment grounding conductor at the service. (CMP-5)

Exhibit 100.6 shows a main bonding jumper that provides the connection between the grounded service conductor and the equipment grounding conductor at the service. Bonding jumpers may be located throughout the electrical system, but a main bonding jumper is located only at the service.

See also

250.28 for main bonding jumper requirements

Bonding Jumper, System. The connection between the grounded circuit conductor and the supply-side bonding jumper, or the equipment grounding conductor, or both, at a separately derived system. (CMP-5)

A system bonding jumper is used to connect the equipment grounding conductor(s) or the supply-side bonding jumper to the grounded conductor of a separately derived system either at the source (see Exhibit 250.15) or at the first system disconnecting means (see Exhibit 250.16). A system bonding jumper is used at the derived system if the derived system contains a grounded conductor.

Like the main bonding jumper at the service equipment, the system bonding jumper provides the necessary link between the equipment grounding conductors and the system grounded conductor in order to establish an effective path for ground-fault current to return to the source.

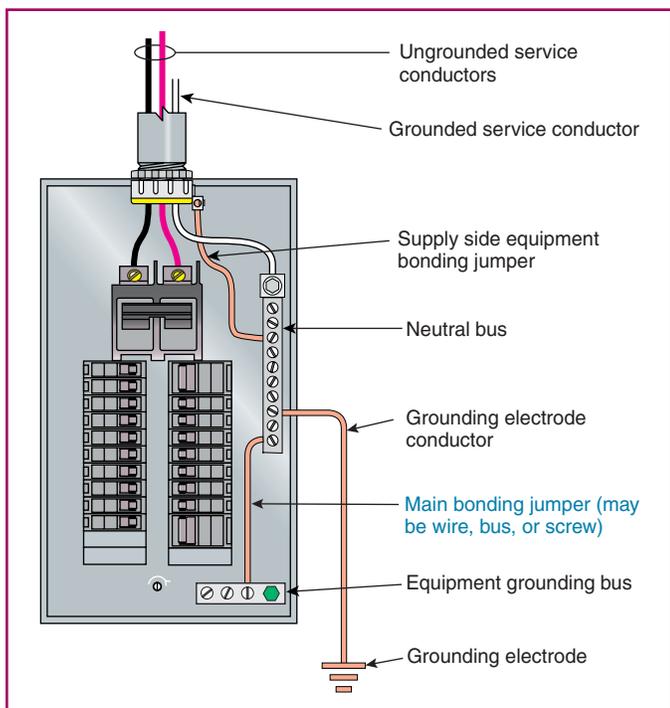

EXHIBIT 100.6 A main bonding jumper installed at the service between the grounded service conductor and the equipment grounding conductor.

See also

250.30(A)(1) for system bonding jumper requirements

Branch Circuit. The circuit conductors between the final overcurrent device protecting the circuit and the outlet(s). (CMP-2)

Exhibit 100.7 shows the difference between branch circuits and feeders. Conductors between the overcurrent devices in the panelboards and the duplex receptacles are branch-circuit conductors. Conductors

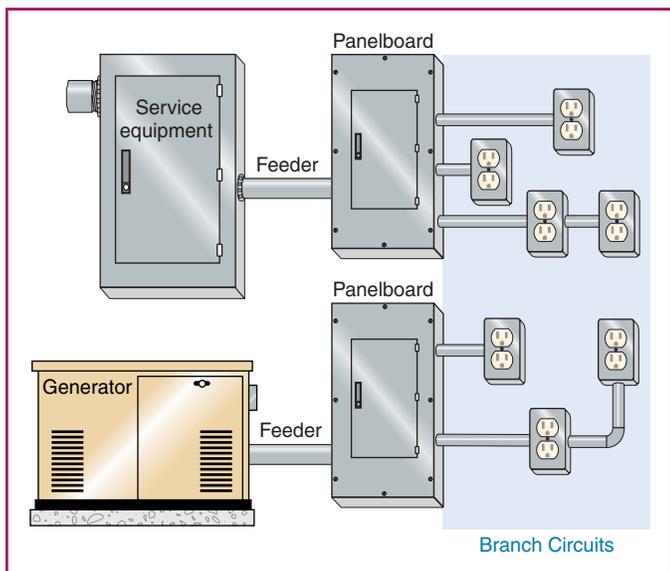

EXHIBIT 100.7 Feeder (circuits) and branch circuits.

between the service equipment or source of separately derived systems and the panelboards are feeders.

Branch Circuit, Appliance. A branch circuit that supplies energy to one or more outlets to which appliances are to be connected and that has no permanently connected luminaires that are not a part of an appliance. (CMP-2)

See also

210.11(C)(1), which requires two or more 20-ampere small-appliance branch circuits for dwelling units

210.52(B)(1), which requires that these circuits supply receptacle outlets located in rooms such as the kitchen and pantry

210.52, which provides details on small-appliance branch circuits not permitted to supply other outlets or permanently connected luminaires

Branch Circuit, General-Purpose. A branch circuit that supplies two or more receptacles or outlets for lighting and appliances. (CMP-2)

Branch Circuit, Individual. A branch circuit that supplies only one utilization equipment. (CMP-2)

Exhibit 100.8 illustrates an individual branch circuit with a single receptacle for connection of one piece of utilization equipment (e.g., one dryer, one range, one space heater, one motor). A branch circuit supplying one duplex receptacle that supplies two cord-and-plug-connected appliances or similar equipment is not an individual branch circuit.

See also

210.23 for permissible loads on individual branch circuits

210.21(B)(1), which requires the single receptacle to have an ampere rating not less than that of the branch circuit

Branch Circuit, Multiwire. A branch circuit that consists of two or more ungrounded conductors that have a voltage between them, and a grounded conductor that has equal voltage between

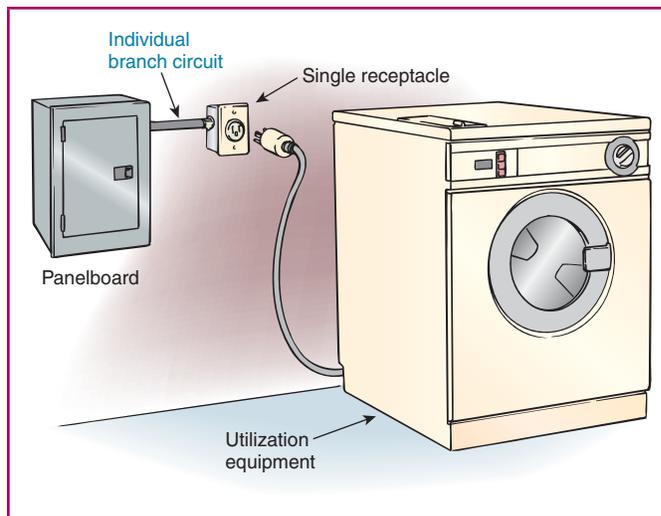

EXHIBIT 100.8 An individual branch circuit, supplying only one piece of utilization equipment via a single receptacle.

it and each ungrounded conductor of the circuit and that is connected to the neutral or grounded conductor of the system. (CMP-2)

See also

210.4, 240.15(B)(1), and 300.13(B) for specific information about multiwire branch circuits

Building. A structure that stands alone or that is separated from adjoining structures by fire walls. (CMP-1)

A building is generally considered to be a roofed or walled structure that is intended for supporting or sheltering any use or occupancy. However, a separate structure such as a pole, billboard sign, or water tower may also be considered to be a building. Definitions of the terms *fire walls* and *fire doors* are the responsibility of building codes. Generically, a fire wall may be defined as a wall that separates buildings or subdivides a building to prevent the spread of fire and that has a fire resistance rating and structural stability.

Cabinet. An enclosure that is designed for either surface mounting or flush mounting and is provided with a frame, mat, or trim in which a swinging door or doors are or can be hung. (CMP-9)

Cabinets are designed for surface or flush mounting with a trim to which a swinging door(s) is hung. A *cutout box* is designed for surface mounting with a swinging door(s) secured directly to the box. A *panelboard* is an electrical assembly designed to be placed in a cabinet or cutout box.

See also

Article 312, which covers both cabinets and cutout boxes

Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route communications wires and cables, optical fiber cables, data cables associated with information technology and communications equipment, Class 2, Class 3, and Type PLTC cables, and power-limited fire alarm cables in plenum, riser, and general-purpose applications. (CMP-16)

Charge Controller. Equipment that controls dc voltage or dc current, or both, and that is used to charge a battery or other energy storage device. (CMP-13)

Circuit Breaker. A device designed to open and close a circuit by nonautomatic means and to open the circuit automatically on a predetermined overcurrent without damage to itself when properly applied within its rating. (CMP-10)

Informational Note: The automatic opening means can be integral, direct acting with the circuit breaker, or remote from the circuit breaker.

Adjustable (as applied to circuit breakers). A qualifying term indicating that the circuit breaker can be set to trip at various values of current, time, or both, within a predetermined range.

Instantaneous Trip (as applied to circuit breakers). A qualifying term indicating that no delay is purposely introduced in the tripping action of the circuit breaker.

Inverse Time (as applied to circuit breakers). A qualifying term indicating that there is purposely introduced a delay in the tripping action of the circuit breaker, which delay decreases as the magnitude of the current increases.

Nonadjustable (as applied to circuit breakers). A qualifying term indicating that the circuit breaker does not have any adjustment to alter the value of the current at which it will trip or the time required for its operation.

Setting (of circuit breakers). The value of current, time, or both, at which an adjustable circuit breaker is set to trip.

Clothes Closet. A nonhabitable room or space intended primarily for storage of garments and apparel. (CMP-1)

This definition helps to determine whether the rules of **240.24(D), 410.16, and 550.11(A)** apply to an installation. If the definition does not apply, the area may be classified as something other than a clothes closet, such as a bedroom. Other requirements may then be applied, such as **210.52** and **210.70**.

Coaxial Cable. A cylindrical assembly composed of a conductor centered inside a metallic tube or shield, separated by a dielectric material, and usually covered by an insulating jacket. (CMP-16)

Combustible Dust [as applied to Hazardous (Classified) Locations]. Dust particles that are 500 microns or smaller (i.e., material passing a U.S. No. 35 Standard Sieve as defined in ASTM E11-2015, *Standard Specification for Woven Wire Test Sieve Cloth and Test Sieves*), and present a fire or explosion hazard when dispersed and ignited in air. (CMP-14)

Informational Note: See ASTM E1226-2012a, *Standard Test Method for Explosibility of Dust Clouds*, or ISO 6184-1, *Explosion protection systems — Part 1: Determination of explosion indices of combustible dusts in air*, for procedures for determining the explosibility of dusts.

Combustible Gas Detection System [as applied to Hazardous (Classified) Locations]. A protection technique utilizing stationary gas detectors in industrial establishments. (CMP-14)

Communications Equipment. The electronic equipment that performs the telecommunications operations for the transmission of audio, video, and data, and includes power equipment (e.g., dc converters, inverters, and batteries), technical support equipment (e.g., computers), and conductors dedicated solely to the operation of the equipment. (CMP-16)

Informational Note: As the telecommunications network transitions to a more data-centric network, computers, routers, servers, and their powering equipment, are becoming essential to the transmission of audio, video, and data and are finding increasing application in communications equipment installations.

Communications equipment includes related power supplies and computers, which are subject to the same requirements that apply to communications equipment. This definition correlates with NFPA 76, *Standard for the Fire Protection of Telecommunications Facilities*.

Communications Raceway. An enclosed channel of nonmetallic materials designed expressly for holding communications wires and cables; optical fiber cables; data cables associated with information technology and communications equipment; Class 2, Class 3, and Type PLTC cables; and power-limited fire alarm cables in plenum, riser, and general-purpose applications. (CMP-16)

Composite Optical Fiber Cable. A cable containing optical fibers and current-carrying electrical conductors. (CMP-16)

Concealed. Rendered inaccessible by the structure or finish of the building. (CMP-1)

Informational Note: Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Raceways and cables supported or located within hollow frames or permanently enclosed by the finish of buildings are considered concealed. Raceways and cables in unfinished basements; in accessible underfloor areas or attics; or behind, above, or below panels designed to allow access; and that may be removed without damage to the building structure or finish are not considered concealed. See the definition of *exposed (as applied to wiring methods)*.

Conductive Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering and containing non-current-carrying conductive member(s) such as metallic strength member(s), metallic vapor barrier(s), metallic armor or metallic sheath. (CMP-16)

Conductor, Bare. A conductor having no covering or electrical insulation whatsoever. (CMP-6)

Conductor, Covered. A conductor encased within material of composition or thickness that is not recognized by this *Code* as electrical insulation. (CMP-6)

The uninsulated grounded system conductor within the overall exterior jacket of a Type SE cable is an example of a covered conductor. Covered conductors should always be treated as bare conductors for working clearances because the covering does not have a voltage rating, so the conductors are effectively uninsulated. See the definition of *insulated conductor*.

Conductor, Insulated. A conductor encased within material of composition and thickness that is recognized by this *Code* as electrical insulation. (CMP-6)

For the covering on a conductor to be considered insulation, it is generally required to pass minimum testing required by a product standard. One such product standard is UL 83, *Thermoplastic-Insulated Wires and Cables*. To meet the requirements of UL 83, specimens of finished single-conductor wires must pass specified tests that measure (1) resistance to flame propagation, (2) dielectric strength, even while immersed, and (3) resistance to abrasion, cracking, crushing, and impact. Only wires and cables that meet the minimum fire, electrical, and physical properties required by the applicable product standards are permitted to be marked with the letter designations found in Table 310.104(A). Unless a

voltage rating is marked on the insulation, a conductor generally should be considered as a covered conductor. However, Class 2 conductors are not permitted to have a marked voltage rating.

See also

310.104 for the requirements of insulated conductor construction and applications

Conduit Body. A separate portion of a conduit or tubing system that provides access through a removable cover(s) to the interior of the system at a junction of two or more sections of the system or at a terminal point of the system.

Boxes such as FS and FD or larger cast or sheet metal boxes are not classified as conduit bodies. (CMP-6)

Conduit bodies include the short-radius type as well as capped elbows and service-entrance elbows. Conduit bodies include the LB, LL, LR, C, T, and X designs. A typical conduit body is shown in Exhibit 100.9.

See also

300.15 and **Article 314** for rules on the usage of conduit bodies
Table 314.16(A) for Type FS and Type FD boxes, which are not classified as conduit bodies

Connector, Pressure (Solderless). A device that establishes a connection between two or more conductors or between one or more conductors and a terminal by means of mechanical pressure and without the use of solder. (CMP-1)

Continuous Load. A load where the maximum current is expected to continue for 3 hours or more. (CMP-2)

Control Circuit. The circuit of a control apparatus or system that carries the electric signals directing the performance of the controller but does not carry the main power current. (CMP-11)

EXHIBIT 100.9 Typical conduit bodies. (Courtesy of the National Electrical Contractors Association)

Control Drawing [as applied to Hazardous (Classified) Locations]. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus. (CMP-14)

Controller. A device or group of devices that serves to govern, in some predetermined manner, the electric power delivered to the apparatus to which it is connected. (CMP-1)

A controller may be a remote-controlled magnetic contactor, switch, circuit breaker, or other device that is normally used to start and stop motors and other apparatus. Stop-and-start stations and similar control circuit components that do not open the power conductors to the motor are not considered controllers.

Cooking Unit, Counter-Mounted. A cooking appliance designed for mounting in or on a counter and consisting of one or more heating elements, internal wiring, and built-in or mountable controls. (CMP-2)

Coordination, Selective (Selective Coordination). Localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the selection and installation of overcurrent protective devices and their ratings or settings for the full range of available overcurrents, from overload to the maximum available fault current, and for the full range of overcurrent protective device opening times associated with those overcurrents. (CMP-10)

Fuses and circuit breakers have time/current characteristics that determine the time it takes to clear the fault for a given value of fault current. Selectivity occurs when the device closest to the fault opens before the next device upstream operates. Any fault on a branch circuit should open the branch-circuit breaker rather than the feeder overcurrent protection. All faults on a feeder should open the feeder overcurrent protection rather than the service overcurrent protection.

With coordinated overcurrent protection, the faulted or overloaded circuit is isolated by the selective operation of only the overcurrent protective device closest to the overcurrent condition. The main goal of selective coordination is to isolate the faulted portion of the electrical circuit quickly while at the same time maintaining power to the remainder of the electrical system. The electrical system overcurrent protection must guard against short circuits and ground faults to ensure that the resulting damage is minimized while other parts of the system not directly involved with the fault are kept operational until other protective devices clear the fault. Where a series-rated system is used, an upstream device in the series will operate to protect a downstream device. For example, a current-limiting fuse will limit the available fault current to the downstream circuit breaker.

700.32, 701.27, and 708.54 for selective coordination requirements for emergency systems, legally required standby systems, and critical operations power systems, respectively

620.62 for selective coordination requirements for elevator feeders
517.31(G), in which coordination is required only for faults that exceed 0.1 second in duration

Copper-Clad Aluminum Conductors. Conductors drawn from a copper-clad aluminum rod, with the copper metallurgically bonded to an aluminum core, where the copper forms a minimum of 10 percent of the cross-sectional area of a solid conductor or each strand of a stranded conductor. (CMP-6)

Cord Connector [as applied to Hazardous (Classified) Locations]. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust-ignitionproof, or a flameproof seal. (CMP-14)

The inclusion of TC-ER and TC-ER-HL as a wiring method in **Articles 501, 502, 503, 505, and 506** requires a method of termination that currently is identified as a *cord connector* in the HazLoc industry. However, the wiring device industry also uses the term *cord connector* to refer to a female electrical connector. The differentiation has been addressed by denoting “[as applied to hazardous (classified) locations].”

Cutout Box. An enclosure designed for surface mounting that has swinging doors or covers secured directly to and telescoping with the walls of the enclosure. (CMP-9)

Dead Front. Without live parts exposed to a person on the operating side of the equipment. (CMP-9)

Demand Factor. The ratio of the maximum demand of a system, or part of a system, to the total connected load of a system or the part of the system under consideration. (CMP-2)

Device A unit of an electrical system, other than a conductor, that carries or controls electric energy as its principal function. (CMP-1)

Switches, circuit breakers, fuseholders, receptacles, attachment plugs, and lampholders that distribute or control but do not consume electrical energy are considered devices. Devices that consume incidental amounts of electrical energy in the performance of carrying or controlling electricity — such as a switch or a receptacle with an internal pilot light or a magnetic contactor — are considered devices and not utilization equipment. Although conductors are units of the electrical system, they are not devices.

Disconnecting Means. A device, or group of devices, or other means by which the conductors of a circuit can be disconnected from their source of supply. (CMP-1)

Dust-Ignitionproof [as applied to Hazardous (Classified) Locations]. Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure. (CMP-14)

Informational Note: For further information on dust-ignitionproof enclosures, see **ANSI/UL 1202-2013, Enclosures**

for Electrical Equipment, and ANSI/UL 1203-2013, *Explosion-proof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions. (CMP-14)

Informational Note No. 1: Enclosure Types 3, 3S, 3SX, 4, 4X, 5, 6, 6P, 12, 12K, and 13, per ANSI/NEMA 250-2014, *Enclosures for Electrical Equipment*, are considered dusttight and suitable for use in unclassified locations and in Class II, Division 2; Class III; and Zone 22 hazardous (classified) locations.

Informational Note No. 2: For further information, see ANSI/ISA-12.12.01-2013, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

Some dusttight constructions are only for wind-blown dust and may not be designed for combustible dusts found in Class II hazardous locations. The basic standard used to investigate dusttight enclosures for Class II, Division 2 locations is UL 1604, *Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations*. A dusttight enclosure has been determined to exclude dust under specified test conditions. Combustible dust is 500 microns or smaller. The AHJ determines the suitability of a dusttight enclosure or the acceptance of a specific standard, test, or listing organization.

See also

110.28 and **Table 110.28** for enclosure requirements, as well as the commentary following the definition of *enclosure*

Duty, Continuous. Operation at a substantially constant load for an indefinitely long time. (CMP-1)

Duty, Intermittent. Operation for alternate intervals of (1) load and no load; or (2) load and rest; or (3) load, no load, and rest (CMP-1)

Duty, Periodic. Intermittent operation in which the load conditions are regularly recurrent. (CMP-1)

Duty, Short-Time. Operation at a substantially constant load for a short and definite, specified time. (CMP-1)

Duty, Varying. Operation at loads, and for intervals of time, both of which may be subject to wide variation. (CMP-1)

Dwelling, One-Family. A building that consists solely of one dwelling unit. (CMP-1)

Dwelling, Two-Family. A building that consists solely of two dwelling units. (CMP-1)

Dwelling, Multifamily. A building that contains three or more dwelling units. (CMP-1)

Dwelling Unit. A single unit, providing complete and independent living facilities for one or more persons, including permanent provisions for living, sleeping, cooking, and sanitation. (CMP-2)

Where dwelling units are referenced throughout the *NEC*, rooms in motels, hotels, and similar occupancies that have permanent provisions

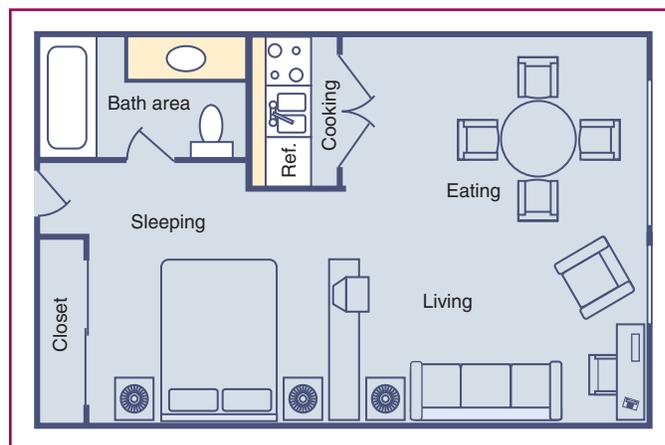

EXHIBIT 100.10 An example of a motel or hotel room considered to be a dwelling unit.

for living, sleeping, cooking, and sanitation are also classified as dwelling units. **Exhibit 100.10** illustrates a motel or hotel room that meets this definition. Dorm rooms are not usually considered to be dwelling units because they do not meet the definition.

Effective Ground-Fault Current Path. An intentionally constructed, low-impedance electrically conductive path designed and intended to carry current under ground-fault conditions from the point of a ground fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground-fault detectors. (CMP-5)

Electric Power Production and Distribution Network. Power production, distribution, and utilization equipment and facilities, such as electric utility systems that deliver electric power to the connected loads, that are external to and not controlled by an interactive system. (CMP-13)

Electric Sign. A fixed, stationary, or portable self-contained, electrically operated and/or electrically illuminated utilization equipment with words or symbols designed to convey information or attract attention. (CMP-18)

Electric-Discharge Lighting. Systems of illumination utilizing fluorescent lamps, high-intensity discharge (HID) lamps, or neon tubing. (CMP-18)

Electrical Circuit Protective System A system consisting of components and materials intended for installation as protection for specific electrical wiring systems with respect to the disruption of electrical circuit integrity upon exterior fire exposure. (CMP-16)

Electronically Actuated Fuse. An overcurrent protective device that generally consists of a control module that provides current-sensing, electronically derived time-current characteristics, energy to initiate tripping, and an interrupting module that interrupts current when an overcurrent occurs. Such fuses may or may not operate in a current-limiting fashion, depending on the type of control selected. (CMP-10)

Enclosed. Surrounded by a case, housing, fence, or wall(s) that prevents persons from accidentally contacting energized parts. (CMP-1)

Enclosure. The case or housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage. (CMP-1)

Informational Note: See [Table 110.28](#) for examples of enclosure types.

Enclosures are required by [110.28](#) to be marked with a number that identifies the environmental conditions in which that type of enclosure can be used. Enclosures that comply with the requirements for more than one type of enclosure are marked with multiple designations.

See also

[110.28](#) and its commentary for details on enclosure markings and types

[Table 110.28](#) for a list of the types of enclosures required to be used in specific locations

Energized. Electrically connected to, or is, a source of voltage. (CMP-1)

The term *energized* is not limited to equipment that is “connected to a source of voltage.” Equipment such as batteries, capacitors, and conductors with induced voltages must also be considered energized.

Equipment. A general term, including fittings, devices, appliances, luminaires, apparatus, machinery, and the like used as a part of, or in connection with, an electrical installation. (CMP-1)

This definition clarifies that machinery is considered equipment.

See also

[Article 670](#) and [NFPA 79](#), *Electrical Standard for Industrial Machinery*, for more information on industrial machinery

Explosionproof Equipment. Equipment enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby. (CMP-14)

Informational Note: For further information, see ANSI/UL 1203-2009, *Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations*.

Exposed (as applied to live parts). Capable of being inadvertently touched or approached nearer than a safe distance by a person. (CMP-1)

Informational Note: This term applies to parts that are not suitably guarded, isolated, or insulated.

See the definition of *live parts*.

Exposed (as applied to wiring methods). On or attached to the surface or behind panels designed to allow access. (CMP-1)

See [Exhibit 100.2](#), which illustrates wiring methods that would be considered exposed because they are located above a suspended ceiling with lift-out panels.

Externally Operable. Capable of being operated without exposing the operator to contact with live parts. (CMP-1)

Feeder. All circuit conductors between the service equipment, the source of a separately derived system, or other power supply source and the final branch-circuit overcurrent device. (CMP-2)

See the commentary following the definition of *branch circuit*, including [Exhibit 100.7](#), which illustrates the difference between branch circuits and feeders.

Festoon Lighting. A string of outdoor lights that is suspended between two points. (CMP-18)

Field Evaluation Body (FEB). An organization or part of an organization that performs field evaluations of electrical or other equipment. [790, 2012] (CMP-1)

Some laboratories that evaluate listed products also provide field labeling services. However, this definition does not limit field evaluation bodies to those that list products. A field evaluation usually does not extend beyond the specific equipment seen by the evaluator.

Field Labeled (as applied to evaluated products). Equipment or materials to which has been attached a label, symbol, or other identifying mark of an FEB indicating the equipment or materials were evaluated and found to comply with requirements as described in an accompanying field evaluation report. (CMP-1)

Fitting An accessory such as a locknut, bushing, or other part of a wiring system that is intended primarily to perform a mechanical rather than an electrical function. (CMP-1)

[Conduit bodies and couplings](#), [EMT connectors and couplings](#), and [threadless connectors](#) are considered fittings.

Garage. A building or portion of a building in which one or more self-propelled vehicles can be kept for use, sale, storage, rental, repair, exhibition, or demonstration purposes. (CMP-1)

Informational Note: For commercial garages, repair and storage, see [Article 511](#).

Ground. The earth. (CMP-5)

Ground Fault. An unintentional, electrically conductive connection between an ungrounded conductor of an electrical circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth. (CMP-5)

Grounded (Grounding). Connected (connecting) to ground or to a conductive body that extends the ground connection. (CMP-5)

Grounded, Solidly. Connected to ground without inserting any resistor or impedance device. (CMP-5)

Grounded Conductor. A system or circuit conductor that is intentionally grounded. (CMP-5)

Ground-Fault Circuit Interrupter (GFCI). A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a current to ground exceeds the values established for a Class A device. (CMP-2)

Informational Note: Class A ground-fault circuit interrupters trip when the current to ground is 6 mA or higher and do not trip when the current to ground is less than 4 mA. For further information, see UL 943, *Standard for Ground-Fault Circuit Interrupters*.

The commentary for 210.8 includes a table that provides references to other GFCI requirements in the NEC. Exhibits 210.6 through 210.8 provide further information on, and examples of, GFCIs.

Ground-Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system through normally non-current-carrying conductors, equipment, or the earth to the electrical supply source. (CMP-5)

Informational Note: Examples of ground-fault current paths are any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal, water, and gas piping; steel framing members; stucco mesh; metal ducting; reinforcing steel; shields of communications cables; and the earth itself.

Ground-Fault Protection of Equipment. A system intended to provide protection of equipment from damaging line-to-ground fault currents by operating to cause a disconnecting means to open all ungrounded conductors of the faulted circuit. This protection is provided at current levels less than those required to protect conductors from damage through the operation of a supply circuit overcurrent device. (CMP-5)

See also

230.95, 426.28, and 427.22 commentary for more information on ground-fault protection of equipment

Grounding Conductor, Equipment (EGC). The conductive path(s) that provides a ground-fault current path and connects normally non-current-carrying metal parts of equipment together and to the system grounded conductor or to the grounding electrode conductor, or both. (CMP-5)

Informational Note No. 1: It is recognized that the equipment grounding conductor also performs bonding.

Informational Note No. 2: See 250.118 for a list of acceptable equipment grounding conductors.

Grounding Electrode. A conducting object through which a direct connection to earth is established. (CMP-5)

Grounding Electrode Conductor. A conductor used to connect the system grounded conductor or the equipment to a grounding electrode or to a point on the grounding electrode system. (CMP-5)

Exhibit 100.6 and Exhibit 250.1 show a grounding electrode conductor in a typical grounding system for a single-phase, 3-wire service.

Guarded. Covered, shielded, fenced, enclosed, or otherwise protected by means of suitable covers, casings, barriers, rails, screens, mats, or platforms to remove the likelihood of approach or contact by persons or objects to a point of danger. (CMP-1)

Guest Room. An accommodation combining living, sleeping, sanitary, and storage facilities within a compartment. (CMP-2)

Guest Suite. An accommodation with two or more contiguous rooms comprising a compartment, with or without doors between such rooms, that provides living, sleeping, sanitary, and storage facilities. (CMP-2)

If a guest room or guest suite contains permanent provisions for cooking, dwelling unit requirements apply.

Handhole Enclosure. An enclosure for use in underground systems, provided with an open or closed bottom, and sized to allow personnel to reach into, but not enter, for the purpose of installing, operating, or maintaining equipment or wiring or both. (CMP-9)

Handhole enclosures are required by 314.30 to be “identified” for use in underground systems. Exhibit 100.11 shows the installation of one type of handhole enclosure.

Hermetic Refrigerant Motor-Compressor. A combination consisting of a compressor and motor, both of which are enclosed in the same housing, with no external shaft or shaft seals, with the motor operating in the refrigerant. (CMP-11)

Hermetically Sealed [as applied to Hazardous (Class fied) Locations]. Equipment sealed against the entrance of an external

EXHIBIT 100.11 An example of a handhole enclosure. [Courtesy of Quazite® (Hubbell Lenoir City, Inc.)]

atmosphere where the seal is made by fusion, for example, soldering, brazing, welding, or the fusion of glass to metal. (CMP-14)

Informational Note: For further information, see ANSI/ISA-12.12.01-2013, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

Hoistway. Any shaftway, hatchway, well hole, or other vertical opening or space in which an elevator or dumbwaiter is designed to operate. (CMP-12)

Hybrid System. A system comprised of multiple power sources. These power sources could include photovoltaic, wind, microhydro generators, engine-driven generators, and others, but do not include electric power production and distribution network systems. Energy storage systems such as batteries, flywheels, or superconducting magnetic storage equipment do not constitute a power source for the purpose of this definition. The energy regenerated by an overhauling (descending) elevator does not constitute a power source for the purpose of this definition. (CMP-4)

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular *Code* requirement. (CMP-1)

Informational Note: Some examples of ways to determine suitability of equipment for a specific purpose, environment, or application include investigations by a qualified testing laboratory (listing and labeling), an inspection agency, or other organizations concerned with product evaluation.

In Sight From (Within Sight From, Within Sight). Where this *Code* specifies that one equipment shall be “in sight from,” “within sight from,” or “within sight of,” and so forth, another equipment, the specified equipment is to be visible and not more than 15 m (50 ft) distant from the other. (CMP-1)

Most disconnecting means are required to be in sight from the equipment that it controls. “In sight from” means that there are no obstructions such as walls that will prevent a view of the disconnect operating handle from the equipment location.

Industrial Control Panel. An assembly of two or more components consisting of one of the following: (1) power circuit components only, such as motor controllers, overload relays, fused disconnect switches, and circuit breakers; (2) control circuit components only, such as push buttons, pilot lights, selector switches, timers, switches, and control relays; (3) a combination of power and control circuit components. These components, with associated wiring and terminals, are mounted on, or contained within, an enclosure or mounted on a subpanel.

The industrial control panel does not include the controlled equipment. (CMP-11)

Information Technology Equipment (ITE). Equipment and systems rated 1000 volts or less, normally found in offices or other business establishments and similar environments classified

as ordinary locations, that are used for creation and manipulation of data, voice, video, and similar signals that are not communications equipment as defined in Part I of Article 100 and do not process communications circuits as defined in 800.2. (CMP-12)

Informational Note: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1-2014, *Information Technology Equipment — Safety — Part 1: General Requirements* or UL 62368-1-2014, *Audio/Video Information and Communication Technology Equipment Part 1: Safety Requirements*.

Innerduct. A nonmetallic raceway placed within a larger raceway. (CMP-16)

Interactive Inverter. An inverter intended for use in parallel with an electric utility to supply common loads that may deliver power to the utility. (CMP-13)

The most common interactive inverters are string inverters and microinverters. String inverters are typically connected to a number of photovoltaic (PV) modules. Microinverters are usually connected to a single module. If microinverters are used in an installation, each module will have its own microinverter. String inverters and microinverters can both be interactive.

Interactive System. An electric power production system that is operating in parallel with and capable of delivering energy to an electric primary source supply system. (CMP-4)

Interrupting Rating. The highest current at rated voltage that a device is identified to interrupt under standard test conditions. (CMP-10)

Informational Note: Equipment intended to interrupt current at other than fault levels may have its interrupting rating implied in other ratings, such as horsepower or locked rotor current.

Interrupting ratings are essential for the coordination of electrical systems. Exhibit 100.12 depicts the label of a 1600-ampere frame circuit breaker, showing the interrupting capacity ratings. See the definition of *short-circuit current rating*.

See also

110.9, 240.60(C), 240.83(C), and 240.86, which deal specifically with interrupting ratings

Intersystem Bonding Termination. A device that provides a means for connecting intersystem bonding conductors for communications systems to the grounding electrode system. (CMP-16)

An intersystem bonding termination is a dedicated location for terminating the equipment grounding conductors required in Chapter 8 and 770.93 to the service, building, or structure’s grounding electrode system.

Intrinsically Safe Apparatus. Apparatus in which all the circuits are intrinsically safe. (CMP-14)

Intrinsically Safe System [as applied to Hazardous (Classified) Locations]. An assembly of interconnected intrinsically

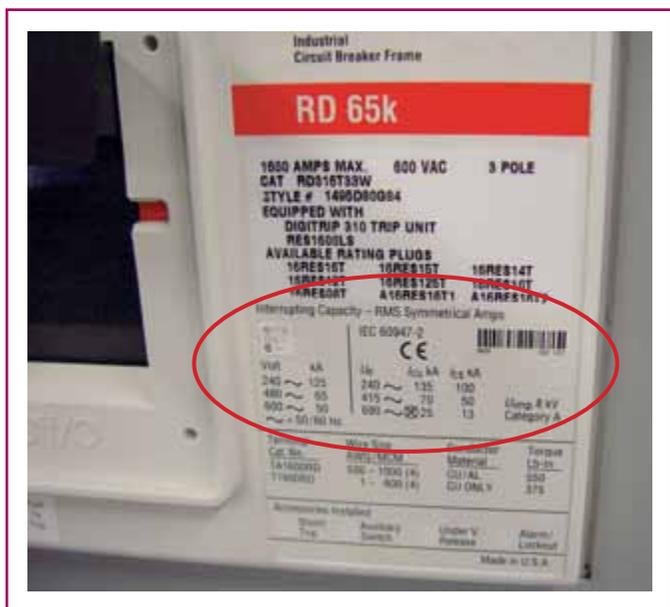

EXHIBIT 100.12 Interrupting ratings information on the label of a 1600-ampere frame circuit breaker.

safe apparatus, associated apparatus, and interconnecting cables, in that those parts of the system that may be used in hazardous (classified) locations are intrinsically safe circuits. (CMP-14)

Informational Note: An intrinsically safe system may include more than one intrinsically safe circuit.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used (CMP-1)

Kitchen. An area with a sink and permanent provisions for food preparation and cooking. (CMP-2)

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials, and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner. (CMP-1)

Equipment and conductors required or permitted by the *NEC* are acceptable only if they have been approved for a specific environment or application by the AHJ as stated in 110.2. Listing or labeling by a qualified testing laboratory provides a basis for approval.

See also

90.7 regarding the examination of equipment for safety

Lighting Outlet. An outlet intended for the direct connection of a lampholder or luminaire. (CMP-18)

Lighting Track (Track Lighting). A manufactured assembly designed to support and energize luminaires that are capable of being readily repositioned on the track. Its length can be altered by the addition or subtraction of sections of track. (CMP-18)

Listed. Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services, that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services, and whose listing states that either the equipment, material, or service meets appropriate designated standards or has been tested and found suitable for a specified purpose. (CMP-1)

Informational Note: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. Use of the system employed by the listing organization allows the authority having jurisdiction to identify a listed product.

See also the definitions of *approved*, *authority having jurisdiction (AHJ)*, *field evaluated*, *identified (as applied to equipment)*, and *labeled*, which all have distinctly different meanings.

Live Parts. Energized conductive components. (CMP-1)

Live parts are associated with all voltage levels, not just voltage levels that present a shock hazard. See the definitions of *energized* and *exposed*.

Location, Damp. Locations protected from weather and not subject to saturation with water or other liquids but subject to moderate degrees of moisture. (CMP-1)

Informational Note: Examples of such locations include partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements, some barns, and some cold-storage warehouses.

Location, Dry. A location not normally subject to dampness or wetness. A location classified as dry may be temporarily subject to dampness or wetness, as in the case of a building under construction. (CMP-1)

Location, Wet. Installations underground or in concrete slabs or masonry in direct contact with the earth; in locations subject to saturation with water or other liquids, such as vehicle washing areas; and in unprotected locations exposed to weather. (CMP-1)

Both the inside of a raceway in a wet location and a raceway installed underground are considered wet locations. Therefore, any conductors inside the raceway would be required to be suitable for wet locations.

See also

300.6(D) for the general requirement for protection against corrosion and deterioration, which also identifies several examples of wet locations

410.10(A) for requirements for luminaires installed in wet locations

517.2 for the definition of *wet procedure location* in a patient care area

Table 110.28 for a list of suitable enclosures for wet locations

Luminaire. A complete lighting unit consisting of a light source such as a lamp or lamps, together with the parts designed to position the light source and connect it to the power supply. It

may also include parts to protect the light source or the ballast or to distribute the light. A lampholder itself is not a luminaire. (CMP-18)

Light pipes and glass fiber optics are sometimes referred to as “lighting systems.” The definition of *luminaire* includes such systems, because light pipes and fiber optics are actually “parts designed to distribute the light.”

Luminaire is the term specified by IESNA, the ANSI/UL safety standards, and the ANSI/NEMA performance standards for lighting products previously referred to as “light fixtures.” *Luminaire* is also the term used in IEC standards and accepted globally.

Mobile Equipment. Equipment with electrical components suitable to be moved only with mechanical aids or is provided with wheels for movement by person(s) or powered devices. (CMP-14)

Motor Control Center. An assembly of one or more enclosed sections having a common power bus and principally containing motor control units. (CMP-11)

Multioutlet Assembly. A type of surface, flush, or freestanding raceway designed to hold conductors and receptacles, assembled in the field or at the factory. (CMP-18)

Multioutlet assemblies include freestanding assemblies with multiple receptacles, commonly called power poles. In dry locations, metal and nonmetallic multioutlet assemblies are permitted; however, they are not permitted to be installed if concealed.

Exhibit 100.13 shows a multioutlet assembly used for countertop appliances. Portable assemblies, often called “power strips” or “plug strips” are not multioutlet assemblies but are “relocatable power taps”

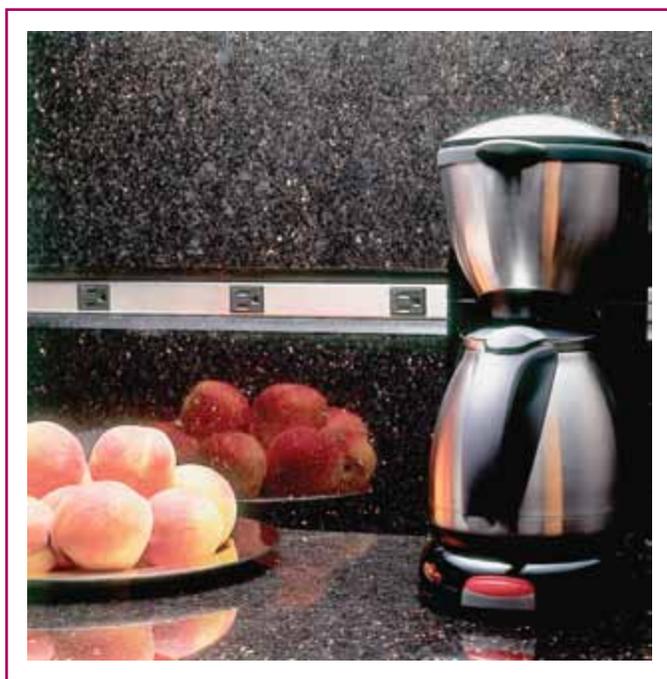

EXHIBIT 100.13 A multioutlet assembly installed to serve countertop appliances. (Courtesy of Legrand/Wiremold®)

See also

Article 380 for details on recessing multioutlet assemblies

Neutral Conductor. The conductor connected to the neutral point of a system that is intended to carry current under normal conditions. (CMP-5)

The neutral conductor is a current-carrying conductor that is not safe to work on while energized.

Neutral Point. The common point on a wye-connection in a polyphase system or midpoint on a single-phase, 3-wire system, or midpoint of a single-phase portion of a 3-phase delta system, or a midpoint of a 3-wire, direct-current system. (CMP-5)

Informational Note: At the neutral point of the system, the vectorial sum of the nominal voltages from all other phases within the system that utilize the neutral, with respect to the neutral point, is zero potential.

Exhibit 100.14 illustrates four examples of a neutral point in a system.

Nonautomatic. Requiring human intervention to perform a function. (CMP-1)

Nonconductive Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering and containing no electrically conductive materials. (CMP-16)

Nonincendive Circuit [as applied to Hazardous (Classified) Locations]. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture. (CMP-14)

Informational Note: Conditions are described in ANSI/ISA-12.12.01-2013, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

A nonincendive circuit employs a protection technique that prevents electrical circuits from causing a fire or explosion in a hazardous location

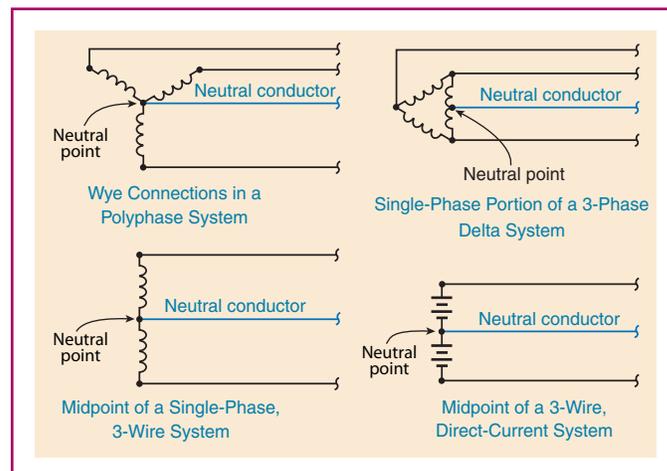

EXHIBIT 100.14 Four examples of a neutral point.

under normal conditions. This is in contrast to an intrinsically safe circuit, whose evaluation is conducted under abnormal conditions. Because of its definition, a nonincendive circuit is a low-energy circuit, but many low-voltage, low-energy circuits, including some communications circuits and thermocouple circuits (or Class 2 or 3 circuits as defined in [Article 725](#)), are not necessarily nonincendive.

Nonincendive Component [as applied to Hazardous (Classified) Locations]. A component having contacts for making or breaking an incendive circuit and the contacting mechanism is constructed so that the component is incapable of igniting the specified flammable gas–air or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion. (CMP-14)

Informational Note: For further information, see ANSI/ISA-12.12.01-2013, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

Nonincendive Equipment [as applied to Hazardous (Classified) Locations]. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means. (CMP-14)

Informational Note: For further information, see ANSI/ISA-12.12.01-2013, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

Nonincendive Field Wiring [as applied to Hazardous (Classified) Locations]. Wiring that enters or leaves an equipment enclosure and under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring. (CMP-14)

Field wiring meeting this definition requires limitations of energy under normally expected conditions of operation, such as opening, shorting, or grounding. For example, stored energy in the form of mutual inductance or capacitance could be released during an opening, shorting, or grounding of nonincendive field wiring, which defeats the purpose of this protection technique.

Nonincendive Field Wiring Apparatus [as applied to Hazardous (Classified) Locations]. Apparatus intended to be connected to nonincendive field wiring. (CMP-14)

Informational Note: For further information, see ANSI/ISA-12.12.01-2013, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

Nonlinear Load. A load where the wave shape of the steady-state current does not follow the wave shape of the applied voltage. (CMP-1)

Informational Note: Electronic equipment, electronic/electric-discharge lighting, adjustable-speed drive systems, and similar equipment may be nonlinear loads.

Nonlinear loads are a major cause of harmonic currents. Additional conductor heating is just one of the undesirable operational effects associated with harmonic currents. Informational Note No. 1(2) following [310.15\(A\)\(3\)](#) points out that harmonic current is one of the factors that must be considered when determining the heat generated internally in a conductor.

Actual circuit measurements of current for nonlinear loads should be made using only true rms-measuring ammeter instruments. Averaging ammeters produces inaccurate values if used to measure nonlinear loads.

See also

[310.15\(B\)\(5\)\(c\)](#) and its commentary for more on nonlinear loads

Oil Immersion [as applied to Hazardous (Classified) Locations]. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited. (CMP-14)

Optical Fiber Cable. A factory assembly or field assembly of one or more optical fibers having an overall covering. (CMP-16)

Informational Note: A field-assembled optical fiber cable is an assembly of one or more optical fibers within a jacket. The jacket, without optical fibers, is installed in a manner similar to conduit or raceway. Once the jacket is installed, the optical fibers are inserted into the jacket, completing the cable assembly.

Outlet. A point on the wiring system at which current is taken to supply utilization equipment. (CMP-1)

The term *outlet* is frequently misused to refer to receptacles. Although receptacle outlets are outlets, not all outlets are receptacle outlets. Other common examples of outlets include lighting outlets and smoke alarm outlets.

Outline Lighting. An arrangement of incandescent lamps, electric-discharge lighting, or other electrically powered light sources to outline or call attention to certain features such as the shape of a building or the decoration of a window. (CMP-18)

Outline lighting includes low-voltage, light-emitting diodes as well as other luminaires installed to form various shapes.

See also

[Article 600](#) for outline lighting requirements

Overcurrent. Any current in excess of the rated current of equipment or the ampacity of a conductor. It may result from overload, short circuit, or ground fault. (CMP-10)

Informational Note: A current in excess of rating may be accommodated by certain equipment and conductors for a given set of conditions. Therefore, the rules for overcurrent protection are specific for particular situations.

Overcurrent Protective Device, Branch-Circuit. A device capable of providing protection for service, feeder, and branch circuits and equipment over the full range of overcurrents between its rated current and its interrupting rating. Such devices are provided with interrupting ratings appropriate for the intended use but no less than 5000 amperes. (CMP-10)

The protection provided may be overload, short-circuit, or ground-fault or a combination, depending on the application.

Overcurrent Protective Device, Supplementary. A device intended to provide limited overcurrent protection for specific applications and utilization equipment such as luminaires and appliances. This limited protection is in addition to the protection provided in the required branch circuit by the branch-circuit overcurrent protective device. (CMP-10)

The definition of *supplementary overcurrent protective device* makes two important distinctions between overcurrent protective devices. First, the use of a supplementary device is specifically limited to a few applications. Second, where it is used, the supplementary device must be in addition to and be protected by the more robust branch-circuit overcurrent protective device.

The devices used to provide overcurrent protection are different, and the differences are found in the product standards UL 489, *Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures*, and UL 1077, *Supplementary Protectors for Use in Electrical Equipment*.

Overload. Operation of equipment in excess of normal, full-load rating, or of a conductor in excess of rated ampacity that, when it persists for a sufficient length of time, would cause damage or dangerous overheating. A fault, such as a short circuit or ground fault, is not an overload. (CMP-10)

Panelboard. A single panel or group of panel units designed for assembly in the form of a single panel, including buses and automatic overcurrent devices, and equipped with or without switches for the control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box placed in or against a wall, partition, or other support; and accessible only from the front. (CMP-9)

Photovoltaic (PV) System. The total components and subsystem that, in combination, convert solar energy into electric energy for connection to a utilization load. (CMP-4)

Plenum. A compartment or chamber to which one or more air ducts are connected and that forms part of the air distribution system. (CMP-3)

Because of concerns about the transfer of products of combustion through environmental air systems, the *NEC* provides specific requirements — in 300.22(B), (C), and (D) and in Articles 725, 760, 770, 800, 820, 830, and 840 — for the installation of wiring methods that are subject to the direct flow of environmental air. The *NEC* definition of the term *plenum* is similar to the definition of *plenum* contained in NFPA 90A, *Standard for the Installation of Air-Conditioning and Ventilating Systems*. The definition is used in conjunction with the requirements for the installation of wiring methods in spaces used for air transfer that are not specifically fabricated as ducts for environmental air.

See also

Article 645 for requirements specific to the air-handling space under a computer room floor

Portable Equipment. Equipment with electrical components suitable to be moved by a single person without mechanical aids. (CMP-14)

Power Outlet. An enclosed assembly that may include receptacles, circuit breakers, fuseholders, fused switches, buses, and watt-hour meter mounting means; intended to supply and control power to mobile homes, recreational vehicles, park trailers, or boats or to serve as a means for distributing power required to operate mobile or temporarily installed equipment. (CMP-19)

A premises wiring system does not have to be supplied by an electric utility. For example, portable generators and stand-alone photovoltaic systems can supply premises wiring systems. If there is no service point, there are no service conductors. The supply conductors are feeder conductors.

Premises Wiring (System). Interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed. This includes (a) wiring from the service point or power source to the outlets or (b) wiring from and including the power source to the outlets where there is no service point.

Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment. (CMP-1)

Informational Note: Power sources include, but are not limited to, interconnected or stand-alone batteries, solar photovoltaic systems, other distributed generation systems, or generators.

Pressurized [as applied to Hazardous (Classified) Locations]. The process of supplying an enclosure with a protective gas with or without continuous flow, at sufficient pressure to prevent the entrance of combustible dust or ignitable fibers/flyings (CMP-14)

Process Seal [as applied to Hazardous (Classified) Locations]. A seal between electrical systems and flammable or combustible process fluids where a failure could allow the migration of process fluids into the premises' wiring system. (CMP-14)

Purged and Pressurized [as applied to Hazardous (Classified) Locations]. The process of (1) purging, supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level; and (2) pressurization, supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber. (CMP-14)

Informational Note: For further information, see ANSI/NFPA 496-2013, *Purged and Pressurized Enclosures for Electrical Equipment*.

Qualified Person. One who has skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training to recognize and avoid the hazards involved. (CMP-1)

Informational Note: Refer to NFPA 70E-2012, *Standard for Electrical Safety in the Workplace*, for electrical safety training requirements.

Section 110.2 of the 2015 edition of *NFPA 70E®, Standard for Electrical Safety in the Workplace®*, provides training requirements for qualified and unqualified persons who may be exposed to electrical hazards.

Raceway. An enclosed channel designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this Code. (CMP-8)

Informational Note: A raceway is identified within specific article definitions.

Cable trays are support systems for wiring methods and are not considered to be raceways.

See also

Article 392 for cable tray requirements

Rainproof. Constructed, protected, or treated so as to prevent rain from interfering with the successful operation of the apparatus under specified test conditions. (CMP-1)

See also

110.28 and its commentary for more information on enclosures considered to be rainproof

Raintight. Constructed or protected so that exposure to a beating rain will not result in the entrance of water under specified test conditions. (CMP-1)

See also

Table 110.28 for information on enclosure types that are considered to be raintight

300.6(A)(2) for related requirements for raintight boxes and cabinets

Receptacle. A contact device installed at the outlet for the connection of an attachment plug, or for the direct connection of electrical utilization equipment designed to mate with the corresponding contact device. A single receptacle is a single contact device with no other contact device on the same yoke. A multiple receptacle is two or more contact devices on the same yoke. (CMP-18)

This definition was revised for the 2017 edition to recognize that not all receptacles are for cord- and plug-connected equipment. A receptacle

can be used for the connection of specific utilization equipment, such as luminaires. **Exhibit 100.15** illustrates a typical locking support and mounting receptacle used for the connection of luminaires.

Receptacle Outlet. An outlet where one or more receptacles are installed. (CMP-18)

Remote-Control Circuit. Any electrical circuit that controls any other circuit through a relay or an equivalent device. (CMP-3)

Retrofit Kit. A general term for a complete subassembly of parts and devices for field conversion of utilization equipment. (CMP-18)

Sealable Equipment. Equipment enclosed in a case or cabinet that is provided with a means of sealing or locking so that live parts cannot be made accessible without opening the enclosure. (CMP-1)

Informational Note: The equipment may or may not be operable without opening the enclosure.

Separately Derived System. An electrical source, other than a service, having no direct connection(s) to circuit conductors of any other electrical source other than those established by grounding and bonding connections. (CMP-5)

Examples of separately derived systems include generators, batteries, converter windings, transformers, and solar photovoltaic systems, provided they have no direct electrical connection to another source. The earth, metal enclosures, metal raceways, and equipment grounding conductors may provide incidental connection between systems. In addition, **250.30(A)(6)** permits a common grounding electrode conductor to be installed for multiple separately derived systems. This definition clarifies that those systems can still be considered to be separately derived systems as long as the separately derived systems have no direct electrical connection to service-derived systems.

Service. The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served. (CMP-4)

A service can only be supplied by the serving utility. If electric energy is supplied by other than the serving utility, the supplied conductors and equipment are considered feeders and not a service.

EXHIBIT 100.15 Components of the listed locking support and mounting receptacle and attachment fitting for a luminaire installation. (Courtesy of Safety Quick Lighting and Fans Corp.)

Service Cable. Service conductors made up in the form of a cable. (CMP-4)

Service Conductors. The conductors from the service point to the service disconnecting means. (CMP-4)

The term *service conductors* is broad and may include overhead service conductors, underground service conductors, and service-entrance conductors. This term specifically excludes any wiring on the supply side (serving utility side) of the service point. The service conductors originate at the service point (where the serving utility ends) and end at the service disconnect. These service conductors may originate only from the serving utility. The definition no longer includes service drops and service laterals; these terms now only apply to conductors that are under the control of the serving utility.

If the utility has specified that the service point is at the utility pole, the service conductors from an overhead distribution system originate at the utility pole and terminate at the service disconnecting means. See [Exhibit 100.16](#) for overhead service conductors.

If the utility has specified that the service point is at the utility manhole, the service conductors from an underground distribution system originate at the utility manhole and terminate at the service disconnecting means. Where utility-owned primary conductors are extended to outdoor pad-mounted transformers on private property, the service conductors originate at the secondary connections of the transformers only if the utility has specified that the service point is at the secondary connections.

See also

[Article 230, Part VIII](#), and the commentary following [230.200](#) for information on service conductors exceeding 1000 volts, nominal

Service Conductors, Overhead. The overhead conductors between the service point and the first point of connection to the service-entrance conductors at the building or other structure (CMP-4)

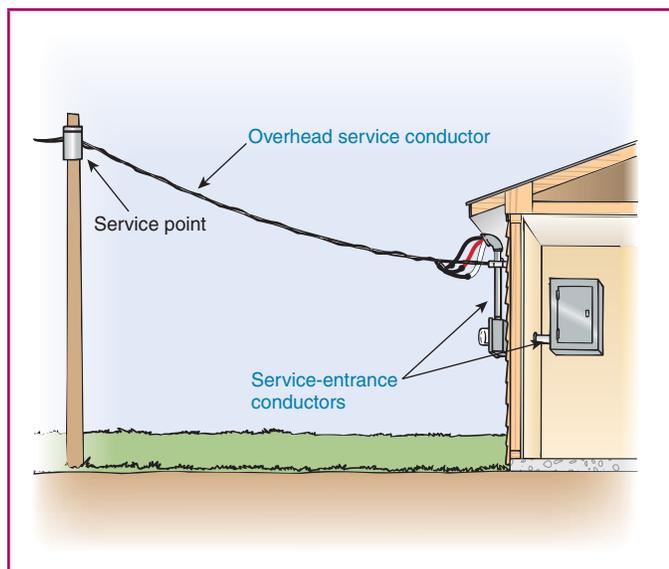

EXHIBIT 100.16 Conductors in an overhead service where the service point is the connection to the terminals on the load side of a utility transformer.

Service Conductors, Underground. The underground conductors between the service point and the first point of connection to the service-entrance conductors in a terminal box, meter, or other enclosure, inside or outside the building wall. (CMP-4)

Informational Note: Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.

Service Drop. The overhead conductors between the utility electric supply system and the service point. (CMP-4)

This definition correlates with the definition of the term *service lateral conductors*. Service-drop and service lateral conductors are conductors on the line side of the service point and are not subject to the *NEC*. Overhead conductors on the load side of the service point are overhead service conductors.

In [Exhibit 100.17](#), the service-drop conductors run from the utility pole and connect to the service-entrance conductors at the service point. Conductors on the utility side of the service point are not covered by the *NEC*. The utility specifies the location of the service point. Exact locations of the service point may vary from utility to utility as well as from occupancy to occupancy.

Service-Entrance Conductors, Overhead System. The service conductors between the terminals of the service equipment and a point usually outside the building, clear of building walls, where joined by tap or splice to the service drop or overhead service conductors. (CMP-4)

See [Exhibit 100.17](#) for an illustration of service-entrance conductors in an overhead system. The system shows a service drop from a utility pole to attachment on a house and service-entrance conductors from point of attachment (spliced to service-drop conductors), down the side of the house, through the meter socket, and terminating in the service equipment. In this instance, the service point is at the drip loop. The conductors on the line side of the service point are under the control of the utility.

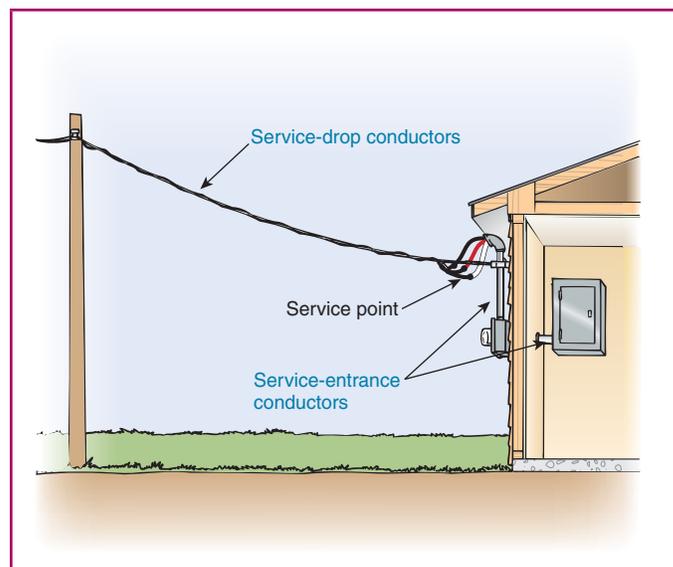

EXHIBIT 100.17 Conductors in an overhead service.

Service-Entrance Conductors, Underground System. The service conductors between the terminals of the service equipment and the point of connection to the service lateral or underground service conductors. (CMP-4)

Informational Note: Where service equipment is located outside the building walls, there may be no service-entrance conductors or they may be entirely outside the building.

See Exhibit 100.18 for an illustration of service-entrance conductors in an underground system. The illustration on the top shows underground service lateral conductors run from a pole to a service point underground. The conductors from the service point into the building are underground service conductors. The illustration on the bottom shows service lateral conductors run from a utility transformer.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply. (CMP-4)

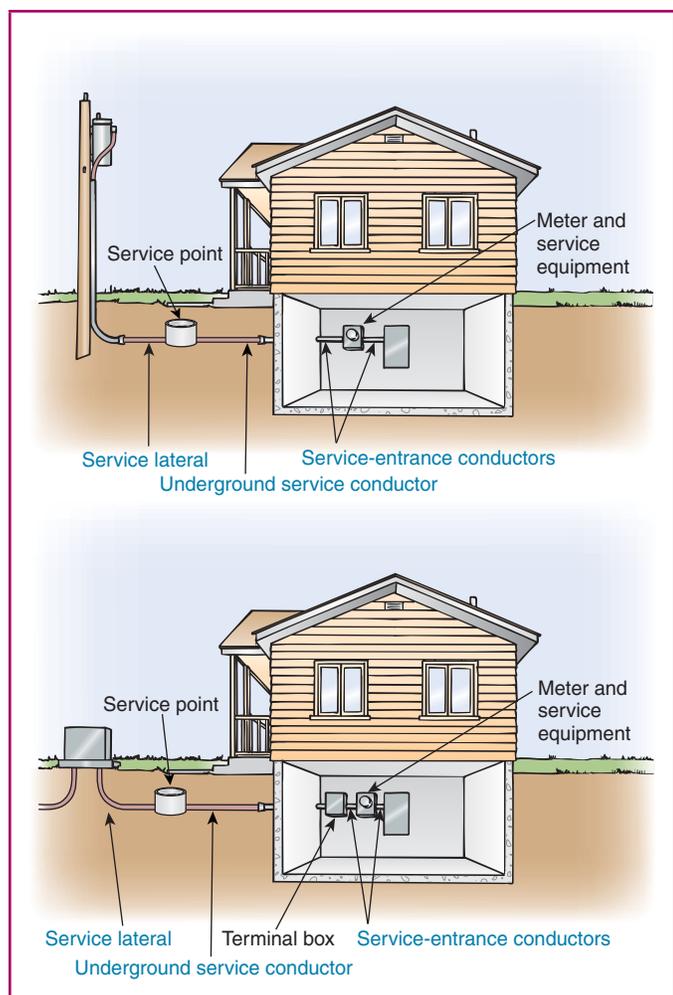

EXHIBIT 100.18 Underground systems showing service laterals run from a pole (top) and from a transformer (bottom).

Service equipment may consist of circuit breakers or fused switches that are provided to disconnect all ungrounded conductors in a building or other structure from the service-entrance conductors. Individual meter socket enclosures are not considered service equipment according to 230.66.

The disconnecting means at any one location in a building or other structure is not allowed to consist of more than six circuit breakers or six switches. The disconnecting means is required to be readily accessible either outside or inside nearest the point of entrance of the service-entrance conductors.

See also

Article 230, Part VI, for service conductor disconnecting means requirements

230.6 for service conductor requirements outside the building

Service Lateral. The underground conductors between the utility electric supply system and the service point. (CMP-4)

Service-drop and service lateral conductors are conductors on the line side of the service point and are not subject to the requirements of the NEC. In other words, these are under the exclusive control of the utility. Underground conductors on the load side of the service point are underground service conductors.

As Exhibit 100.18 shows, the underground service laterals may be run from poles or from transformers, with or without terminal boxes, provided they terminate at the service point. The next transition would be to the underground service conductors, which would connect to the service-entrance conductors, or they may terminate in a terminal box, meter, or some other enclosure, which may be inside or outside of the building. Conductors on the utility side of the service point are not covered by the NEC. The utility specifies the location of the service point. Exact locations of the service point may vary from utility to utility as well as from occupancy to occupancy.

Service Point. The point of connection between the facilities of the serving utility and the premises wiring. (CMP-4)

Informational Note: The service point can be described as the point of demarcation between where the serving utility ends and the premises wiring begins. The serving utility generally specifies the location of the service point based on the conditions of service.

The exact location for a service point is generally determined by the utility and may vary from utility to utility. Only those conductors that are located on the premises wiring side of the service point are covered by the NEC.

Conductors on the serving utility side of the service point generally are not covered by the NEC. For example, a typical suburban residence has overhead conductors from the utility pole to the house. If the utility specifies that the service point is at the point of attachment of the overhead conductors to the house, the overhead conductors are service-drop conductors that are not covered by the NEC because the conductors are not on the premises wiring side of the service point. Alternatively, if the utility specifies that the service point is at the pole, the overhead conductors are considered overhead service conductors, and the NEC would apply to these conductors.

Short-Circuit Current Rating. The prospective symmetrical fault current at a nominal voltage to which an apparatus or system is able to be connected without sustaining damage exceeding defined acceptance criteria. (CMP-10)

The short-circuit current rating is marked on the equipment nameplate as shown in Exhibit 100.19. The available input current must not exceed this rating. Otherwise, the equipment can be damaged by short-circuit currents, posing a hazard to personnel and property. See also the definition of *interrupting rating*.

Show Window. Any window, including windows above doors, used or designed to be used for the display of goods or advertising material, whether it is fully or partly enclosed or entirely open at the rear and whether or not it has a platform raised higher than the street floor level. (CMP-2)

Signaling Circuit. Any electrical circuit that energizes signaling equipment. (CMP-3)

Simple Apparatus [as applied to Hazardous (Classified) Locations]. An electrical component or combination of components of simple construction with well-defined electrical parameters that does not generate more than 1.5 volts, 100 mA, and 25 mW, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used. (CMP-14)

Informational Note: The following apparatus are examples of simple apparatus:

- (1) Passive components; for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
- (2) Sources of stored energy consisting of single components in simple circuits with well-defined parameters; for example,

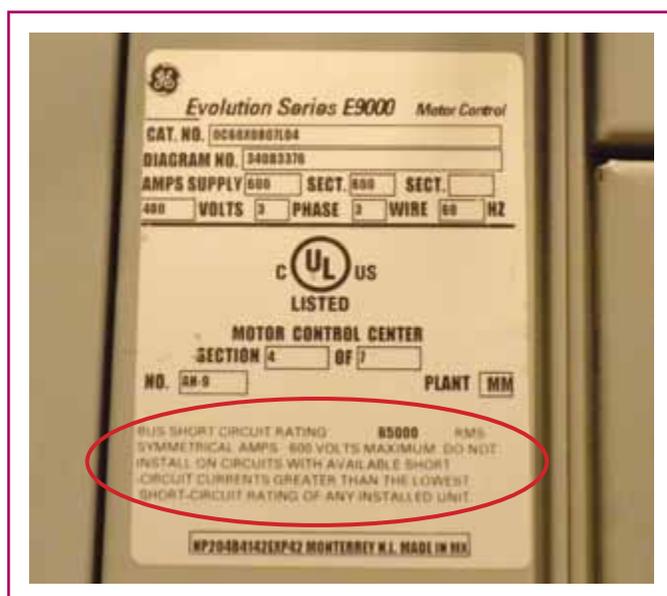

EXHIBIT 100.19 Short-circuit current rating on equipment nameplate.

- capacitors or inductors, whose values are considered when determining the overall safety of the system
- (3) Sources of generated energy; for example, thermocouples and photocells, that do not generate more than 1.5 volts, 100 mA, and 25 mW

Special Permission. The written consent of the authority having jurisdiction. (CMP-1)

The AHJ for enforcement of the *NEC* is responsible for making interpretations and granting special permission contemplated in a number of the rules as stated in 90.4.

See also

90.2(C), 110.26(A)(1)(b), 230.2(B), and 426.14 for requirements governing special permission situations

Stand-Alone System. A system that supplies power independently of an electrical production and distribution network. (CMP-4)

Structure. That which is built or constructed, other than equipment. (CMP-1)

Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions. (CMP-5)

Surge-Protective Device (SPD). A protective device for limiting transient voltages by diverting or limiting surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions and is designated as follows:

Type 1: Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service disconnect overcurrent device.

Type 2: Permanently connected SPDs intended for installation on the load side of the service disconnect overcurrent device, including SPDs located at the branch panel.

Type 3: Point of utilization SPDs.

Type 4: Component SPDs, including discrete components, as well as assemblies. (CMP-5)

Informational Note: For further information on Type 1, Type 2, Type 3, and Type 4 SPDs, see UL 1449, *Standard for Surge Protective Devices*.

Switch, Bypass Isolation. A manually operated device used in conjunction with a transfer switch to provide a means of directly connecting load conductors to a power source and of disconnecting the transfer switch. (CMP-13)

Switch, General-Use. A switch intended for use in general distribution and branch circuits. It is rated in amperes, and it is capable of interrupting its rated current at its rated voltage. (CMP-9)

Switch, General-Use Snap. A form of general-use switch constructed so that it can be installed in device boxes or on box covers, or otherwise used in conjunction with wiring systems recognized by this Code. (CMP-9)

Switch, Isolating. A switch intended for isolating an electrical circuit from the source of power. It has no interrupting rating, and it is intended to be operated only after the circuit has been opened by some other means. (CMP-9)

Switch, Motor-Circuit. A switch rated in horsepower that is capable of interrupting the maximum operating overload current of a motor of the same horsepower rating as the switch at the rated voltage. (CMP-11)

Switch, Transfer. An automatic or nonautomatic device for transferring one or more load conductor connections from one power source to another. (CMP-13)

Switchboard. A large single panel, frame, or assembly of panels on which are mounted on the face, back, or both, switches, over-current and other protective devices, buses, and usually instruments. These assemblies are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets. (CMP-9)

Modern switchboards are totally enclosed to minimize the probability of spreading fire to adjacent combustible materials and to guard live parts. Busbars are arranged to avoid inductive overheating of the enclosure or any nearby metal. Service busbars are isolated by barriers from the remainder of the switchboard to avoid inadvertent contact by personnel or tools during maintenance.

Switchgear. An assembly completely enclosed on all sides and top with sheet metal (except for ventilating openings and inspection windows) and containing primary power circuit switching, interrupting devices, or both, with buses and connections. The assembly may include control and auxiliary devices. Access to the interior of the enclosure is provided by doors, removable covers, or both. (CMP-9)

Informational Note: All switchgear subject to *NEC* requirements is metal enclosed. Switchgear rated below 1000 V or less may be identified as “low-voltage power circuit breaker switchgear.” Switchgear rated over 1000 V may be identified as “metal-enclosed switchgear” or “metal-clad switchgear.” Switchgear is available in non-arc-resistant or arc-resistant constructions.

According to ANSI C37.20, *Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear*, the term *switchgear* includes “metal-enclosed low-voltage power circuit-breaker switchgear,” “metal-clad switchgear,” and “metal-enclosed interrupter switchgear.”

Thermal Protector (as applied to motors). A protective device for assembly as an integral part of a motor or motor-compressor that, when properly applied, protects the motor against dangerous overheating due to overload and failure to start. (CMP-11)

Informational Note: The thermal protector may consist of one or more sensing elements integral with the motor or motor-compressor and an external control device.

Thermally Protected (as applied to motors). The words *Thermally Protected* appearing on the nameplate of a motor or motor-compressor indicate that the motor is provided with a thermal protector. (CMP-11)

Unclassified Locations [as applied to Hazardous (Classified) Locations]. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; Zone 20; Zone 21; Zone 22; nor any combination thereof. (CMP-14)

Ungrounded. Not connected to ground or to a conductive body that extends the ground connection. (CMP-5)

Uninterruptible Power Supply. A power supply used to provide alternating current power to a load for some period of time in the event of a power failure. (CMP-13)

Informational Note: In addition, it may provide a more constant voltage and frequency supply to the load, reducing the effects of voltage and frequency variations.

Utilization Equipment. Equipment that utilizes electric energy for electronic, electromechanical, chemical, heating, lighting, or similar purposes. (CMP-1)

Ventilated. Provided with a means to permit circulation of air sufficient to remove an excess of heat, fumes, or vapors. (CMP-14)

See also

110.13(B) and its commentary for information on cooling of equipment

Volatile Flammable Liquid. A flammable liquid having a flash point below 38°C (100°F), or a flammable liquid whose temperature is above its flash point, or a Class II combustible liquid that has a vapor pressure not exceeding 276 kPa (40 psia) at 38°C (100°F) and whose temperature is above its flash point. (CMP-14)

The flash point is defined as the minimum temperature of a liquid at which sufficient vapor is given off to form an ignitable mixture with the air, near the surface of the liquid or within the vessel used to contain the liquid. An ignitable mixture is defined as a mixture within the explosive or flammable range (between upper and lower limits) that is capable of the propagation of flame away from the source of ignition when ignited. Some emission of vapors takes place below the flash point but not enough to form an ignitable mixture.

Voltage (of a circuit). The greatest root-mean-square (rms) (effective) difference of potential between any two conductors of the circuit concerned. (CMP-1)

Informational Note: Some systems, such as 3-phase 4-wire, single-phase 3-wire, and 3-wire direct current, may have various circuits of various voltages.

Common 3-phase, 4-wire wye systems are 480/277 volts and 208/120 volts. The voltage of the circuit is the higher voltage between any two phase conductors (i.e., 480 volts or 208 volts). The voltage of a single-phase, 2-wire feeder or branch-circuit (with a grounded conductor) derived from these systems would be the voltage between the two conductors (i.e., 277 volts or 120 volts). The same applies to direct current (dc) or single-phase, 3-wire systems where there are two voltages.

Voltage, Nominal. A nominal value assigned to a circuit or system for the purpose of conveniently designating its voltage class (e.g., 120/240 volts, 480Y/277 volts, 600 volts). (CMP-1)

Informational Note No. 1: The actual voltage at which a circuit operates can vary from the nominal within a range that permits satisfactory operation of equipment.

Informational Note No. 2: See ANSI C84.1-2011, *Voltage Ratings for Electric Power Systems and Equipment* (60 Hz).

Informational Note No. 3: Certain battery units may be considered to be rated at nominal 48 volts dc, but may have a charging float voltage up to 58 volts. In dc applications, 60 volts is used to cover the entire range of float voltages.

See also

220.5(A), which provides nominal voltages for use in computing branch-circuit and feeder loads

Voltage to Ground. For grounded circuits, the voltage between the given conductor and that point or conductor of the circuit that is grounded; for ungrounded circuits, the greatest voltage between the given conductor and any other conductor of the circuit. (CMP-1)

This definition can be best illustrated using examples.

System	Voltage to Ground
480/277-volt wye	277
208/120-volt wye	120
3-phase, 3-wire ungrounded 480-volt	480

For a 3-phase 4-wire delta system with the center of one leg grounded, there are three voltages to ground — that is, on a 240-volt system, two legs would each have 120 volts to ground, and the third, or high, leg would have 208 volts to ground.

See also

110.15, **230.56**, and **408.3(E)** for requirements pertaining to special markings and arrangements on such circuit conductors

Watertight. Constructed so that moisture will not enter the enclosure under specified test conditions. (CMP-1)

Unless an enclosure is hermetically sealed, it is possible for moisture to enter the enclosure. The requirements related to watertight enclosures in **110.28** and **Table 110.28** and the accompanying commentary provide additional information.

Weatherproof. Constructed or protected so that exposure to the weather will not interfere with successful operation. (CMP-1)

Informational Note: Rainproof, raintight, or watertight equipment can fulfill the requirements for weatherproof where varying weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

See also

110.28 and its commentary for more information on enclosures considered to be weatherproof, based on exposure to specific environmental conditions

Part II. Over 1000 Volts, Nominal

Electronically Actuated Fuse. An overcurrent protective device that generally consists of a control module that provides current sensing, electronically derived time–current characteristics, energy to initiate tripping, and an interrupting module that interrupts current when an overcurrent occurs. Electronically actuated fuses may or may not operate in a current-limiting fashion, depending on the type of control selected. (CMP-10)

Although they are called fuses because they interrupt current by melting a fusible element, electronically actuated fuses respond to a signal from an electronic control, rather than from the heat generated by actual current passing through a fusible element. Electronically actuated fuses have controls similar to those of electronic circuit breakers.

Fuse. An overcurrent protective device with a circuit-opening fusible part that is heated and severed by the passage of overcurrent through it. (CMP-10)

Informational Note: A fuse comprises all the parts that form a unit capable of performing the prescribed functions. It may or may not be the complete device necessary to connect it into an electrical circuit.

Controlled Vented Power Fuse. A fuse with provision for controlling discharge circuit interruption such that no solid material may be exhausted into the surrounding atmosphere.

Informational Note: The fuse is designed so that discharged gases will not ignite or damage insulation in the path of the discharge or propagate a flashover to or between grounded members or conduction members in the path of the discharge where the distance between the vent and such insulation or conduction members conforms to manufacturer's recommendations.

Expulsion Fuse Unit (Expulsion Fuse). A vented fuse unit in which the expulsion effect of gases produced by the arc and lining of the fuseholder, either alone or aided by a spring, extinguishes the arc.

Nonvented Power Fuse. A fuse without intentional provision for the escape of arc gases, liquids, or solid particles to the atmosphere during circuit interruption.

Power Fuse Unit. A vented, nonvented, or controlled vented fuse unit in which the arc is extinguished by being drawn through solid material, granular material, or liquid, either alone or aided by a spring.

Vented Power Fuse. A fuse with provision for the escape of arc gases, liquids, or solid particles to the surrounding atmosphere during circuit interruption.

Multiple Fuse. An assembly of two or more single-pole fuses. (CMP-10)

Substation. An assemblage of equipment (e.g., switches, interrupting devices, circuit breakers, buses, and transformers) through which electric energy is passed for the purpose of distribution, switching, or modifying its characteristics. (CMP-9)

Switching Device. A device designed to close, open, or both, one or more electrical circuits. (CMP-1)

Circuit Breaker. A switching device capable of making, carrying, and interrupting currents under normal circuit conditions, and also of making, carrying for a specified time, and interrupting currents under specified abnormal circuit conditions, such as those of short circuit.

Cutout. An assembly of a fuse support with either a fuseholder, fuse carrier, or disconnecting blade. The fuseholder or fuse carrier may include a conducting element (fuse link) or may act as the disconnecting blade by the inclusion of a nonfusible member.

Disconnecting Means. A device, group of devices, or other means whereby the conductors of a circuit can be disconnected from their source of supply.

Disconnecting (or Isolating) Switch (Disconnecter, Isolator). A mechanical switching device used for isolating a circuit or equipment from a source of power.

Interrupter Switch. A switch capable of making, carrying, and interrupting specified currents.

Oil Cutout (Oil-Filled Cutout). A cutout in which all or part of the fuse support and its fuse link or disconnecting blade is mounted in oil with complete immersion of the contacts and the fusible portion of the conducting element (fuse link) so that arc interruption by severing of the fuse link or by opening of the contacts will occur under oil.

Oil Switch. A switch having contacts that operate under oil (or askarel or other suitable liquid).

Regulator Bypass Switch. A specific device or combination of devices designed to bypass a regulator.

110.1 Scope. This article covers general requirements for the examination and approval, installation and use, access to and spaces about electrical conductors and equipment; enclosures intended for personnel entry; and tunnel installations.

Informational Note: See **Informative Annex J** for information regarding ADA accessibility design.

110.2 Approval. The conductors and equipment required or permitted by this *Code* shall be acceptable only if approved.

Informational Note: See **90.7**, Examination of Equipment for Safety, and **110.3**, Examination, Identification, Installation, and Use of Equipment. See definitions of *Approved*, *Identified*, *Labeled*, and *Listed*.

Approval of electrical equipment is the responsibility of the electrical inspection authority. Many approvals are based on tests and listings of testing laboratories. Unique equipment is often approved following a field evaluation by a qualified third-party laboratory or qualified individual.

110.3 Examination, Identification, Installation, Use, and Listing (Product Certification) of Equipment.

Listing or labeling is the most common method of establishing suitability. This section does not require listing or labeling of equipment, but it does require considerable evaluation for approval. Before approving the installation, the AHJ may require evidence of compliance with **110.3**.

(A) Examination. In judging equipment, considerations such as the following shall be evaluated:

- (1) Suitability for installation and use in conformity with the provisions of this *Code*

Informational Note No. 1: Equipment may be new, reconditioned, refurbished, or remanufactured.

Informational Note No. 2: Suitability of equipment use may be identified by a description marked on or provided with a product to identify the suitability of the product for a specific purpose, environment, or application. Special conditions of use or other limitations and other pertinent information may be marked on the equipment, included in the product instructions, or included in the appropriate listing and labeling information. Suitability of equipment may be evidenced by listing or labeling.

Examples of special conditions of use include elevated or reduced ambient temperatures, special environmental limitations, stringent power quality requirements, or specific types of overcurrent protective devices. The additional information needed for these special cases may be marked on the equipment, included as part of the listing information in a listing directory, or included in the information furnished with the equipment.

- (2) Mechanical strength and durability, including, for parts designed to enclose and protect other equipment, the adequacy of the protection thus provided

- (3) Wire-bending and connection space
- (4) Electrical insulation
- (5) Heating effects under normal conditions of use and also under abnormal conditions likely to arise in service
- (6) Arcing effects
- (7) Classification by type, size, voltage, current capacity, and specific use
- (8) Other factors that contribute to the practical safeguarding of persons using or likely to come in contact with the equipment

For examples of wire-bending and connection space in cabinets and cutout boxes, see 312.6, Table 312.6(A), Table 312.6(B), 312.7, 312.9, and 312.11. For wire-bending and connection space in other equipment, see the appropriate *NEC* article and section included below.

See also

314.16 and **314.28** for outlet, device, pull, and junction boxes, as well as conduit bodies
404.3 and **404.28** for switches
408.3(F) and **408.55** for switchboards and panelboards
430.10 for motors and motor controllers

(B) Installation and Use. Listed or labeled equipment shall be installed and used in accordance with any instructions included in the listing or labeling.

Manufacturers' listing and labeling installation instructions must be followed, even if the equipment itself is not required to be listed. For example, 210.52 permits permanently installed electric baseboard heaters to be equipped with receptacle outlets that meet the requirements for the wall space utilized by such heaters. The installation instructions for such permanent baseboard heaters indicate that the heaters should not be mounted beneath a receptacle. In dwelling units, the use of low-density heating units more than 12 feet in length is common. Therefore, to meet the requirements of 210.52(A) and also the installation instructions, a receptacle must either be part of the heating unit or be installed in the floor close to the wall but not above the heating unit. (Exhibit 210.26 and the Informational Note to 210.52 provide more specific details.)

Listing or labeling is the most common method of establishing suitability. This section does not require listing or labeling of equipment. Before approving the installation, the AHJ may require evidence of compliance with 110.3.

Some sections do require listed or labeled equipment. For example, 250.8 specifies "listed pressure connectors . . . pressure connectors listed as grounding and bonding equipment [or] . . . other listed means" as connection methods for grounding and bonding conductors.

Listing organizations typically require the use of their listing mark on the equipment as the means of determining if the product is listed. Where it is impractical to have the listing mark on the equipment, the listing organization will usually require that the listing mark be on the smallest unit container in which the product is packaged. Since 110.3(B) requires compliance with the listing requirements, the appropriate certification mark is required if that is a requirement of the listing entity.

(C) Listing. Product testing, evaluation, and listing (product certification) shall be performed by recognized qualified electrical testing laboratories and shall be in accordance with applicable

product standards recognized as achieving equivalent and effective safety for equipment installed to comply with this *Code*.

Informational Note: The Occupational Safety and Health Administration (OSHA) recognizes qualified electrical testing laboratories that perform evaluations, testing, and certification of certain products to ensure that they meet the requirements of both the construction and general industry OSHA electrical standards. If the listing (product certification) is done under a qualified electrical testing laboratory program, this listing mark signifies that the tested and certified product complies with the requirements of one or more appropriate product safety test standards.

110.4 Voltages. Throughout this *Code*, the voltage considered shall be that at which the circuit operates. The voltage rating of electrical equipment shall not be less than the nominal voltage of a circuit to which it is connected.

Voltages used for computing branch-circuit and feeder loads in accordance with Article 220 are nominal voltages as specified in 220.5. See the definitions of *voltage (of a circuit)*; *voltage, nominal*; and *voltage to ground* in Article 100.

See also

300.3(C), which specifies limitations on the use of conductors of circuits rated 1000 volts, nominal, or less, and over 1000 volts, nominal

110.5 Conductors. Conductors normally used to carry current shall be of copper or aluminum unless otherwise provided in this *Code*. Where the conductor material is not specified, the sizes given in this *Code* shall apply to copper conductors. Where other materials are used, the size shall be changed accordingly.

Informational Note: For copper clad aluminum conductor, see 310.15.

See also

310.106(B), which specifies the alloy for aluminum conductors

110.6 Conductor Sizes. Conductor sizes are expressed in American Wire Gage (AWG) or in circular mils.

For copper, aluminum, or copper-clad aluminum conductors up to size 4/0 AWG, the *NEC* uses the American Wire Gage (AWG) for size identification, which is the same as the Brown and Sharpe (BS) Wire Gage. Wire sizes up to size 4/0 AWG are expressed as XX AWG, with XX being the size wire. A wire size expressed as No. 12 in editions prior to 2002 is now expressed as 12 AWG.

Conductors larger than 4/0 AWG are sized in circular mils, beginning with 250,000 circular mils. Prior to the 1990 edition, a 250,000-circular-mil conductor was labeled 250 MCM. The term *MCM* was defined as 1000 circular mils (the first *M* being the Roman numeral designation for 1000). Beginning in the 1990 edition, the notation was changed to 250 kcmil to recognize the accepted convention that *k* indicates 1000. UL standards and IEEE standards also use the notation kcmil rather than MCM.

Table 8 in Chapter 9 and its associated commentary provide the circular mil area for AWG-sized conductors. Where stranded conductors are used, the circular mil area of each strand must be multiplied by the number of strands to determine the circular mil area of the conductor.

110.7 Wiring Integrity. Completed wiring installations shall be free from short circuits, ground faults, or any connections to ground other than as required or permitted elsewhere in this *Code*.

Failure of the insulation system is one of the most common causes of problems in electrical installations. The principal causes of insulation failures are heat, moisture, dirt, and physical damage (abrasion or nicks) occurring during and after installation. Among these hazards are exposure to chemical attack, excessive voltage stresses, saltwater environments or flood waters, or even sunlight (UV degradation).

Overcurrent protective devices must be selected and coordinated using tables of insulation thermal-withstand ability to ensure that the damage point of an insulated conductor is never reached. These tables, entitled "Allowable Short-Circuit Currents for Insulated Copper (or Aluminum) Conductors," are contained in the Insulated Cable Engineers Association's publication ICEA P-32-382.

See also

110.10 for selection criteria for other circuit components

Insulation tests are performed on new or existing installations to determine the quality or condition of the insulation of conductors and equipment. In an insulation resistance test, a voltage ranging from 100 to 5000 (usually 500 to 1000 volts for systems of 1000 volts or less), supplied from a source of constant potential, is applied across the insulation. A megohmmeter is usually the potential source, and it indicates the insulation resistance directly on a scale calibrated in megohms (M Ω). The quality of the insulation is evaluated based on the level of the insulation resistance.

The field data obtained should be corrected to the standard temperature for the class of equipment being tested because insulation resistance of many types of insulation varies with temperature. The megohm value of insulation resistance obtained is inversely proportional to the volume of insulation tested. For example, a cable 1000 feet long would be expected to have one-tenth the insulation resistance of a cable 100 feet long if all other conditions are identical. **Exhibit 110.1** shows a typical megohmmeter insulation tester.

NFPA 70B, *Recommended Practice for Electrical Equipment Maintenance*, provides useful information on test methods and on establishing a preventive maintenance program. Information on specific test methods is available from instrument manufacturers.

110.8 Wiring Methods. Only wiring methods recognized as suitable are included in this *Code*. The recognized methods of wiring shall be permitted to be installed in any type of building or occupancy, except as otherwise provided in this *Code*.

110.9 Interrupting Rating. Equipment intended to interrupt current at fault levels shall have an interrupting rating at nominal circuit voltage at least equal to the current that is available at the line terminals of the equipment.

Equipment intended to interrupt current at other than fault levels shall have an interrupting rating at nominal circuit voltage at least equal to the current that must be interrupted.

Fuses or circuit breakers that do not have adequate interrupting ratings could rupture while attempting to clear a short circuit. The interrupting

EXHIBIT 110.1 A manual multivoltage, multirange insulation tester.

rating of an overcurrent protective device is determined under standard test conditions. The rating should meet or exceed the actual installation needs. Interrupting ratings should not be confused with short-circuit current ratings.

See also

110.10 and its commentary for further explanation of short circuit current ratings

110.10 Circuit Impedance, Short-Circuit Current Ratings, and Other Characteristics. The overcurrent protective devices, the total impedance, the equipment short-circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the circuit protective devices used to clear a fault to do so without extensive damage to the electrical equipment of the circuit. This fault shall be assumed to be either between two or more of the circuit conductors or between any circuit conductor and the equipment grounding conductor(s) permitted in **250.118**. Listed equipment applied in accordance with their listing shall be considered to meet the requirements of this section.

Short-circuit current ratings are marked on equipment such as panelboards, switchboards, switchgear, busways, contactors, and starters. Listed products are subjected to rigorous testing as part of their evaluation, which includes tests under fault conditions. Therefore, listed products used within their ratings are considered to have met the requirements of **110.10**.

The purpose of overcurrent protection is to open the circuit before conductors or conductor insulation is damaged when an overcurrent condition occurs. An overcurrent condition can be the result of an overload, a ground fault, or a short circuit.

Overcurrent protective devices (such as fuses and circuit breakers) should be selected to ensure that the short-circuit current rating of the system components is not exceeded if a short circuit or high-level ground fault occurs.

Wire, bus structures, switching, protection and disconnect devices, and distribution equipment all have limited short-circuit ratings and would be damaged or destroyed if those short-circuit ratings were exceeded. Merely providing overcurrent protective devices with sufficient interrupting ratings would not ensure adequate short-circuit protection for the system components. When the available short-circuit current exceeds the short-circuit current rating of an electrical component, the overcurrent protective device must limit the let-through energy to within the rating of that electrical component.

Utility companies often determine and provide information on available short-circuit current levels to the service equipment. Literature on short-circuit currents in distribution systems can generally be obtained by contacting the manufacturers of overcurrent protective devices or by referring to IEEE 141-1993 (R1999), *IEEE Recommended Practice for Electric Power Distribution for Industrial Plants* (Red Book).

Application Example

The short-circuit current rating of utilization equipment located and connected near the service equipment should be known because the available short-circuit currents near the service equipment are higher than elsewhere in the system. For example, HVAC equipment is tested at 3500 amperes through a 40-ampere load rating and at 5000 amperes for loads rated more than 40 amperes.

For a typical one-family dwelling with a 100-ampere service using 2 AWG aluminum supplied by a 37½ kVA transformer with 1.72 percent impedance located at a distance of 25 feet, the available short-circuit current would be approximately 6000 amperes.

Available short-circuit current to multifamily structures, where pad-mounted transformers are located close to the multimetering location, can be relatively high. For example, the line-to-line fault current values close to a low-impedance transformer could exceed 22,000 amperes. At the secondary of a single-phase, center-tapped transformer, the line-to-neutral fault current is approximately one and one-half times that of the line-to-line fault current.

110.11 Deteriorating Agents. Unless identified for use in the operating environment, no conductors or equipment shall be located in damp or wet locations; where exposed to gases, fumes, vapors, liquids, or other agents that have a deteriorating effect on the conductors or equipment; or where exposed to excessive temperatures.

Informational Note No. 1: See 300.6 for protection against corrosion.

Informational Note No. 2: Some cleaning and lubricating compounds can cause severe deterioration of many plastic materials used for insulating and structural applications in equipment.

Equipment not identified for outdoor use and equipment identified only for indoor use, such as “dry locations,” “indoor use only,” “damp locations,” or enclosure Types 1, 2, 5, 12, 12K, and/or 13, shall be protected against damage from the weather during construction.

Informational Note No. 3: See Table 110.28 for appropriate enclosure-type designations.

Informational Note No. 4: Minimum flood provisions are provided in NFPA 5000-2015 *Building Construction and Safety Code*, the *International Building Code (IBC)*, and the *International Residential Code for One- and Two-Family Dwellings (IRC)*.

The flood-related requirements contained in Chapter 39 and elsewhere in *NFPA 5000*® provide methods to reduce flood damage to buildings and attendant systems. The requirements are based on years of collective experience and are consistent with the minimum requirements of the National Flood Insurance Program (NFIP). Fortunately, flood hazard information — which is necessary to implement the flood-related requirements — is readily available for most communities. The NFIP has mapped flood hazards for approximately 20,000 communities throughout the United States and its territories.

While flood hazards have been mapped by a federal agency on a nationwide basis, floodplain management regulations are adopted and decisions are made at the local level. Communities that choose to participate in the NFIP must adopt local floodplain management regulations, which are no less stringent than minimum NFIP regulations.

The flood-related requirements call for a number of actions, including the following:

1. Using available flood hazard information for the siting, design, and construction of buildings
2. Elevating buildings above the design flood elevation (DFE)
3. Designing and constructing structures to withstand anticipated flood loads during the design flood event
4. Using flood damage-resistant materials below the design flood elevation
5. In coastal areas, elevating buildings on a pile or column foundation and keeping areas below the elevated buildings free of obstructions, which might transfer flood loads to or otherwise damage the elevated portions of buildings during a flood

Other aspects of flood-resistant design and construction covered in Chapter 39 of *NFPA 5000* include determining the lowest floor elevation, designing foundations, selecting materials and systems, bringing existing buildings into compliance, and designing and building manufactured homes and temporary structures.

110.12 Mechanical Execution of Work. Electrical equipment shall be installed in a neat and workmanlike manner.

Informational Note: Accepted industry practices are described in ANSI/NECA 1-2015, *Standard for Good Workmanship in Electrical Construction*, and other ANSI-approved installation standards.

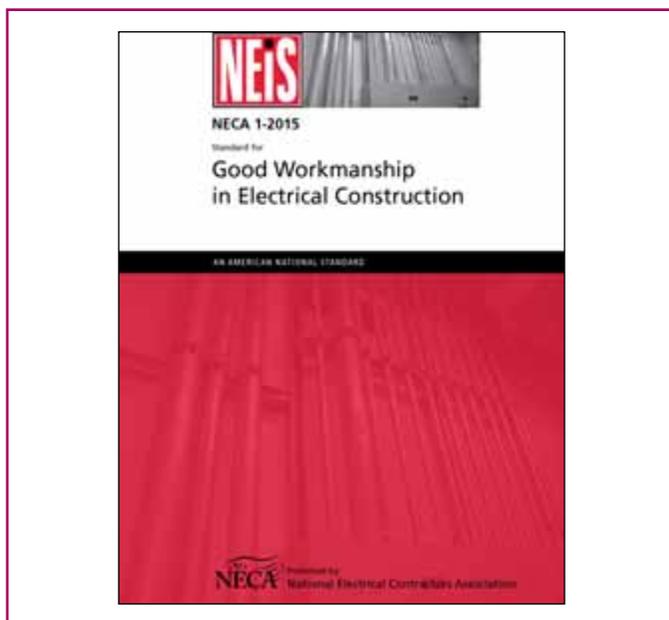

EXHIBIT 110.2 ANSI/NECA 1-2015, *Standard for Good Workmanship in Electrical Construction*, is an example of an ANSI standard that describes “neat and workmanlike” installations. (Courtesy of NECA)

The requirement for “neat and workmanlike” installations has appeared in the *NEC* as currently worded for more than a half-century. Such an installation represents pride in one’s work and has been emphasized by persons involved in the training of apprentice electricians for many years. A neat and workmanlike installation is also easy to troubleshoot and is unlikely to have operational problems.

Many *NEC* violations cited by the AHJ have been based on the authority’s interpretation of “neat and workmanlike manner.” **Exhibit 110.2** is an example of an industry-accepted ANSI standard that describes and illustrates “neat and workmanlike” electrical installations.

Installations that do not qualify as “neat and workmanlike” include exposed runs of cables or raceways that are sagging between supports or supported by improper methods; kinked, flattened, or incorrectly sized; or cabinets, cutout boxes, and enclosures that are not plumb or not properly secured.

(A) Unused Openings. Unused openings, other than those intended for the operation of equipment, those intended for mounting purposes, or those permitted as part of the design for listed equipment, shall be closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (¼ in.) from the outer surface of the enclosure.

(B) Integrity of Electrical Equipment and Connections. Internal parts of electrical equipment, including busbars, wiring terminals, insulators, and other surfaces, shall not be damaged or contaminated by foreign materials such as paint, plaster, cleaners, abrasives, or corrosive residues. There shall be no damaged parts that may adversely affect safe operation

or mechanical strength of the equipment such as parts that are broken; bent; cut; or deteriorated by corrosion, chemical action, or overheating.

110.13 Mounting and Cooling of Equipment.

(A) Mounting. Electrical equipment shall be firmly secured to the surface on which it is mounted. Wooden plugs driven into holes in masonry, concrete, plaster, or similar materials shall not be used.

(B) Cooling. Electrical equipment that depends on the natural circulation of air and convection principles for cooling of exposed surfaces shall be installed so that room airflow over such surfaces is not prevented by walls or by adjacent installed equipment. For equipment designed for floor mounting, clearance between top surfaces and adjacent surfaces shall be provided to dissipate rising warm air.

Electrical equipment provided with ventilating openings shall be installed so that walls or other obstructions do not prevent the free circulation of air through the equipment.

The term *ventilated* is defined in **Article 100**. Ventilating openings in equipment are provided to allow the circulation of room air around internal equipment components. Blocking these openings can cause dangerous overheating. For example, a ventilated busway must be located where there are no walls or other obstructions that might interfere with the natural circulation of air and convection principles for cooling. The surfaces of some enclosures, such as panelboards and transformers, may also require normal room air circulation to prevent overheating. Proper placement of equipment requiring ventilation becomes enforceable using the requirements of **110.3(B)**.

See also

430.14(A) and **430.16** for ventilation requirements for motors
450.9 and **450.45** for ventilation requirements for transformers

110.14 Electrical Connections. Because of different characteristics of dissimilar metals, devices such as pressure terminal or pressure splicing connectors and soldering lugs shall be identified for the material of the conductor and shall be properly installed and used. Conductors of dissimilar metals shall not be intermixed in a terminal or splicing connector where physical contact occurs between dissimilar conductors (such as copper and aluminum, copper and copper-clad aluminum, or aluminum and copper-clad aluminum), unless the device is identified for the purpose and conditions of use. Materials such as solder, fluxes, inhibitors, and compounds, where employed, shall be suitable for the use and shall be of a type that will not adversely affect the conductors, installation, or equipment.

Connectors and terminals for conductors more finely stranded than Class B and Class C stranding as shown in **Chapter 9**, **Table 10**, shall be identified for the specific conductor class or classes.

(A) Terminals. Connection of conductors to terminal parts shall ensure a thoroughly good connection without damaging the conductors and shall be made by means of pressure connectors (including set-screw type), solder lugs, or splices to flexible leads. Connection by means of wire-binding screws or studs and nuts that have upturned lugs or the equivalent shall be permitted for 10 AWG or smaller conductors.

Terminals for more than one conductor and terminals used to connect aluminum shall be so identified.

(B) Splices. Conductors shall be spliced or joined with splicing devices identified for the use or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined so as to be mechanically and electrically secure without solder and then be soldered. All splices and joints and the free ends of conductors shall be covered with an insulation equivalent to that of the conductors or with an identified insulating device.

Wire connectors or splicing means installed on conductors for direct burial shall be listed for such use.

Electrical connection failures are the cause of many equipment burn-outs and fires. Many of these failures are attributable to improper terminations, poor workmanship, the differing characteristics of dissimilar metals, and improper binding screws or splicing devices.

UL's requirements for listing solid aluminum conductors in 12 AWG and 10 AWG and its requirements for listing snap switches and receptacles for use on 15- and 20-ampere branch circuits incorporate stringent tests that are intended to prevent termination failures. Screwless pressure terminal connectors of the conductor push-in type are for use only with solid copper and copper-clad aluminum conductors.

See also

404.14(C) and **406.3(C)** for further information regarding receptacles and switches using CO/ALR-rated terminals

The electrical industry has developed new product and material designs that provide increased levels of safety for aluminum wire terminations. See the accompanying Aluminum Wire Terminations feature.

(C) Temperature Limitations. The temperature rating associated with the ampacity of a conductor shall be selected and coordinated so as not to exceed the lowest temperature rating of any connected termination, conductor, or device. Conductors with temperature ratings higher than specified for terminations shall be permitted to be used for ampacity adjustment, correction, or both.

(1) Equipment Provisions. The determination of termination provisions of equipment shall be based on **110.14(C)(1)(a)** or **(C)(1)(b)**. Unless the equipment is listed and marked otherwise, conductor ampacities used in determining equipment termination provisions shall be based on **Table 310.15(B)(16)** as appropriately modified by **310.15(B)(7)**.

(a) Termination provisions of equipment for circuits rated 100 amperes or less, or marked for 14 AWG through 1 AWG conductors, shall be used only for one of the following:

- (1) Conductors rated 60°C (140°F).
- (2) Conductors with higher temperature ratings, provided the ampacity of such conductors is determined based on the 60°C (140°F) ampacity of the conductor size used.
- (3) Conductors with higher temperature ratings if the equipment is listed and identified for use with such conductors.
- (4) For motors marked with design letters B, C, or D, conductors having an insulation rating of 75°C (167°F) or higher shall be permitted to be used, provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity.

(b) Termination provisions of equipment for circuits rated over 100 amperes, or marked for conductors larger than 1 AWG, shall be used only for one of the following:

- (1) Conductors rated 75°C (167°F)
- (2) Conductors with higher temperature ratings, provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity of the conductor size used, or up to their ampacity if the equipment is listed and identified for use with such conductors

(2) Separate Connector Provisions. Separately installed pressure connectors shall be used with conductors at the ampacities not exceeding the ampacity at the listed and identified temperature rating of the connector.

Informational Note: With respect to **110.14(C)(1)** and **(C)(2)**, equipment markings or listing information may additionally restrict the sizing and temperature ratings of connected conductors.

When equipment of 1000 volts or less is evaluated, conductors sized according to **Table 310.15(B)(16)** are required to be used. The *UL Guide Information for Electrical Equipment — The White Book* indicates that the 60°C and 75°C termination temperature ratings for equipment have been determined using conductors from **NEC Table 310.15(B)(16)**. However, installers or designers who are unaware of the UL guide information might attempt to select conductors based on a table other than **Table 310.15(B)(16)**, especially if a wiring method is used that allows the use of ampacities such as those in **Table 310.15(B)(17)**, which can result in overheated equipment terminations. The ampacities shown in other tables could be used for various conditions to which the wiring method is subject (such as ambient or ampacity correction conditions), but the conductor size at the equipment termination must be based on ampacities from **Table 310.15(B)(16)**.

Conductor terminations, as well as conductors, must be rated for the operating temperature of the circuit. For example, the load on an 8 AWG THHN, 90°C copper conductor is limited to 40 amperes where connected to a disconnect switch with terminals rated at 60°C. The same conductor is limited to 50 amperes where connected to a fusible switch with terminals rated at 75°C. Not only do termination temperature ratings apply to conductor terminations, but the equipment enclosure marking must also permit terminations above 60°C. **Exhibit 110.6** shows an example of termination temperature marking.

(D) Installation. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions

CLOSER LOOK: Aluminum Wire Terminations

For New Installations

The following commentary is based on a report prepared by the Ad Hoc Committee on Aluminum Terminations prior to publication of the 1975 NEC. This information is still pertinent today and is necessary for compliance with 110.14(A) when aluminum wire is used in new installations. New installation of aluminum conductors on 15- and 20-ampere branch circuits is not common, but many of these circuits continue to be in use.

New Materials and Devices

For direct connection, only 15- and 20-ampere receptacles and switches marked “CO/ALR” and connected as follows should be used. The “CO/ALR” marking is on the device mounting yoke or strap. The “CO/ALR” marking means the devices have been tested to stringent heat-cycling requirements to determine their suitability for use with UL-labeled aluminum, copper, or copper-clad aluminum wire.

Listed solid aluminum wire, 12 AWG or 10 AWG, marked with the aluminum insulated wire label should be used. The installation instructions that are packaged with the wire should be followed.

Installation Method

Exhibit 110.3 illustrates the following correct method of connection:

1. The freshly stripped end of the wire is wrapped two-thirds to three-quarters of the distance around the wire-binding screw post as shown in Step A. The loop is made so that rotation of the

screw during tightening will tend to wrap the wire around the post rather than unwrap it.

2. The screw is tightened until the wire is snugly in contact with the underside of the screw head and with the contact plate on the wiring device as shown in Step B.
3. The screw is tightened an additional half-turn to provide a firm connection as shown in Step C. When a torque screwdriver is used, the screw is tightened to 12 inch-pounds.
4. The wires should be positioned behind the wiring device to decrease the likelihood of the terminal screws loosening when the device is positioned into the outlet box.

Exhibit 110.4 illustrates incorrect methods of connection. These methods should *not* be used.

Existing Inventory

Labeled 12 AWG or 10 AWG solid aluminum wire that does not bear the new aluminum wire label should be used with wiring devices marked “CO/ALR” and connected as described under the Installation Method heading. This is the preferred and recommended method for using such wire.

For the following types of devices, the terminals should not be directly connected to aluminum conductors but may be used with labeled copper or copper-clad conductors:

1. Receptacles and snap switches marked “AL-CU”
2. Receptacles and snap switches having no conductor marking
3. Receptacles and snap switches that have back-wired terminals or screwless terminals of the push-in type

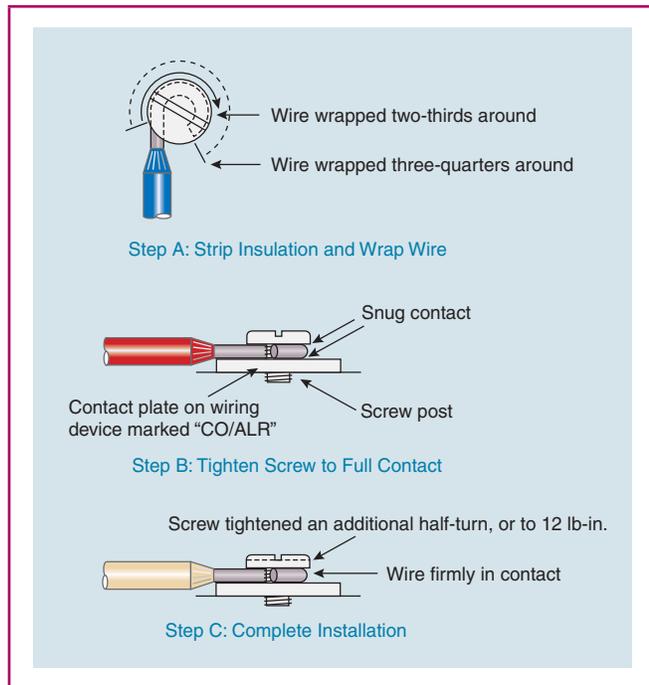

EXHIBIT 110.3 Correct method of terminating aluminum wire at wire-binding screw terminals of receptacles and snap switches. (Courtesy of Underwriters Laboratories Inc.)

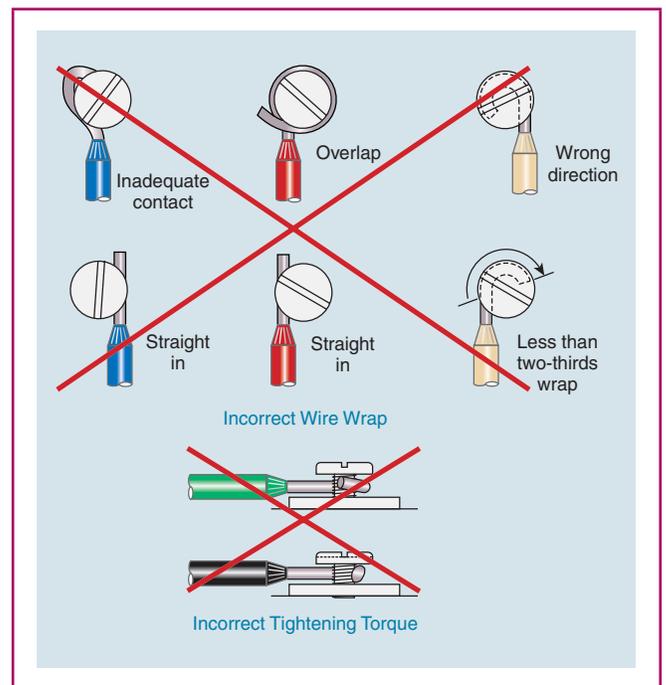

EXHIBIT 110.4 Incorrect methods of terminating aluminum wire at wire-binding screw terminals of receptacles and snap switches. (Courtesy of Underwriters Laboratories Inc.)

For Existing Installations

If examination discloses overheating or loose connections, the recommendations described under the Existing Inventory heading should be followed.

Splicing Wire Connectors

Splicing wire connectors are required to be marked for the material of the conductor and for their suitability where intermixed. Splicing wire connectors, such as twist-on wire connectors, are not suitable for splicing aluminum conductors or copper-clad aluminum to copper conductors, unless it is so stated and marked as such on the unit container or an information sheet supplied with the unit container. The required marking is "AL-CU (intermixed-dry locations)" where intermixing (direct contact) occurs. Other types of listed splicing wire connectors that are not rated for intermixing between the copper and the aluminum may also be used, as long as the conductors are not in direct physical contact. These connectors are just marked "AL-CU."

UL lists twist-on wire connectors that are suitable for use with aluminum-to-copper conductors, in accordance with UL 486C, *Splicing Wire Connectors*. The UL listing does *not* cover aluminum-to-aluminum combinations. However, more than one aluminum or copper conductor is allowed where used in combination. Suitable wire combinations are marked on the unit container or supplied on the information sheet with the unit container. These listed splicing wire-connecting devices are available for pigtailling short lengths of copper conductors directly

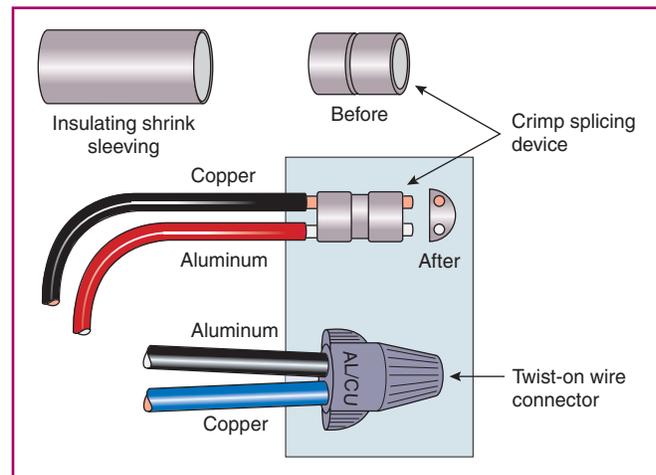

EXHIBIT 110.5 Pigtailling copper-to-aluminum conductors using two listed devices.

to the original aluminum branch-circuit conductors as shown in Exhibit 110.5. Also depicted is a similarly rated crimp splicing device that is also suitable for intermixing (direct contact). Primarily, these pigtailed conductors supply 15- and 20-ampere wiring devices. Pig-tailing is permitted, provided suitable space is within the enclosure.

EXHIBIT 110.6 An example of termination temperature marking on a main circuit breaker. (Courtesy of the International Association of Electrical Inspectors)

provided by the manufacturer, a calibrated torque tool shall be used to achieve the indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

Findings of a field study presented during the 2011 cycle to substantiate Informative Annex I and articles published in IAEI News and EC&M have shown that terminations are improperly tightened at least 75 percent of the time if a torque wrench is not used. Since the reliability and safety of terminations depends on proper connection, the use of the proper tool

is essential. For wire connectors for which the manufacturer has not assigned a value appropriate for the design, Informative Annex I provides information on the tightening torques from UL 468A-B, *Wire Connectors*. These tables should be used for guidance only if no tightening information on a specific wire connector is available. They should not be used to replace the manufacturer's instructions, which should always be followed.

UL 486A-B refers to conductor stranding by class. Terminals and connectors for conductors that are more finely stranded than Class B and C stranding are required to be identified for the class or classes of conductor stranding and the number of strands. Table 10 in Chapter 9 provides information for the application of this information in the field.

110.15 High-Leg Marking. On a 4-wire, delta-connected system where the midpoint of one phase winding is grounded, only the conductor or busbar having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color or by other effective means. Such identification shall be placed at each point on the system where a connection is made if the grounded conductor is also present.

The high leg is common on a 240/120-volt 3-phase, 4-wire delta system. It is typically designated as "B phase." The high-leg marking, which is required to be the color orange or other similar effective means, is intended to prevent problems caused by the lack of standardization where metered and nonmetered equipment are installed in the same installation. See Exhibit 110.7. Electricians should always test each phase relative to ground with suitable equipment to determine exactly where the high leg is located in the system.

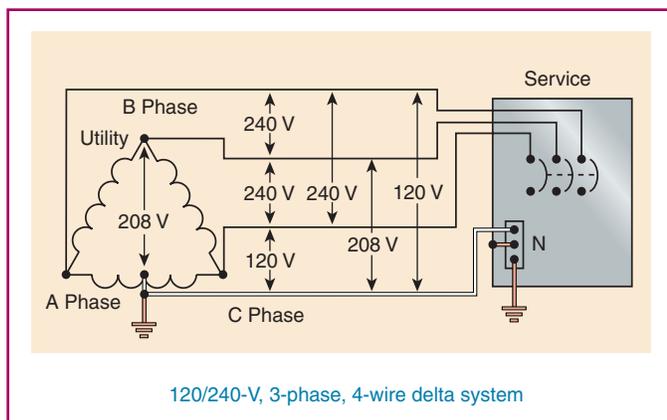

EXHIBIT 110.7 A 240/120-volt 3-phase, 4-wire delta system.

110.16 Arc-Flash Hazard Warning.

(A) General. Electrical equipment, such as switchboards, switchgear, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that is in other than dwelling units, and is likely to require examination, adjustment, servicing, or maintenance while energized, shall be field or factory marked to warn qualified persons of potential electric arc flash hazards. The marking shall meet the requirements in 110.21(B) and shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Proper warning labels raise the level of awareness of electrical arc-flash hazards and decrease the number of accidents that result when electricians do not wear the proper type of protective clothing while working on "hot" (energized) equipment. Exhibit 110.8 is one example of an equipment warning sign as required by this section.

See also

110.16(B) and its commentary for information on service equipment labels

Exhibit 110.9 shows workers wearing personal protective equipment (PPE) considered appropriate flash protection clothing for the flash hazard involved. Suitable PPE appropriate to a particular hazard is described in *NFPA 70E*, *Standard for Electrical Safety in the Workplace*.

Accident reports confirm the fact that workers responsible for the installation or maintenance of electrical equipment often do not turn off the power source before working on the equipment. Working on electrical equipment that is energized is a major safety concern in the electrical industry. This requirement alerts electrical contractors, electricians, facility owners and managers, and other interested parties to some of the hazards present when personnel are exposed to energized electrical conductors or circuit parts. It emphasizes the importance of turning off the power before working on electrical circuits. This section does not apply to equipment in dwelling units. However, multifamily dwellings, which include multiple dwelling units, could have the same electric service as a commercial office building. The intent is to provide warnings to electricians working on these larger services.

Employers can be assured that they are providing a safe workplace for workers if safety-related work practices required by *NFPA 70E* are

EXHIBIT 110.8 One example of an arc-flash warning sign. (Courtesy of the International Association of Electrical Inspectors)

EXHIBIT 110.9 Workers clothed in personal protective equipment (PPE) appropriate for the hazard involved. (Courtesy of KTR Associates/ ArcFlashPPE.com)

implemented and followed. See the commentary following the definition of *qualified person* in Article 100.

Additional information on electrical accidents can be found in the 2015 report "Hazards of Working on Energized Electrical Equipment," published by the National Electrical Manufacturers Association.

(B) Service Equipment. In other than dwelling units, in addition to the requirements in (A), a permanent label shall be field or factory applied to service equipment rated 1200 amps or more. The label shall meet the requirements of 110.21(B) and contain the following information:

- (1) Nominal system voltage
- (2) Available fault current at the service overcurrent protective devices

- (3) The clearing time of service overcurrent protective devices based on the available fault current at the service equipment
- (4) The date the label was applied

Exception: Service equipment labeling shall not be required if an arc flash label is applied in accordance with acceptable industry practice.

Informational Note No. 1: *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*, provides guidance, such as determining severity of potential exposure, planning safe work practices, arc flash labeling, and selecting personal protective equipment.

Informational Note No. 2: *ANSI Z535.4-2011, Product Safety Signs and Labels*, provides guidelines for the design of safety signs and labels for application to products.

Informational Note No. 3: Acceptable industry practices for equipment labeling are described in *NFPA 70E-2015 Standard for Electrical Safety in the Workplace*. This standard provides specific criteria for developing arc-flash labels for equipment that provides nominal system voltage, incident energy levels, arc-flash boundaries, minimum required levels of personal protective equipment, and so forth.

The available short-circuit current must be known at the time of installation in order to comply with the interrupting requirements of 110.9 and 110.10. This information is necessary to determine the incident energy and working distance for compliance with *NFPA 70E* for future work on the service equipment.

110.18 Arcing Parts. Parts of electrical equipment that in ordinary operation produce arcs, sparks, flames, or molten metal shall be enclosed or separated and isolated from all combustible material.

Informational Note: For hazardous (classified) locations, see [Articles 500](#) through [517](#). For motors, see [430.14](#).

Examples of electrical equipment that may produce sparks during ordinary operation include open motors that have centrifugal starting switches, open motors with commutators, and collector rings. Adequate separation from combustible material is essential if open motors with those features are used.

110.19 Light and Power from Railway Conductors. Circuits for lighting and power shall not be connected to any system that contains trolley wires with a ground return.

Exception: Such circuit connections shall be permitted in car houses, power houses, or passenger and freight stations operated in connection with electric railways.

110.21 Marking.

(A) Equipment Markings.

(1) **General.** The manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified shall be placed on all electrical equipment. Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in

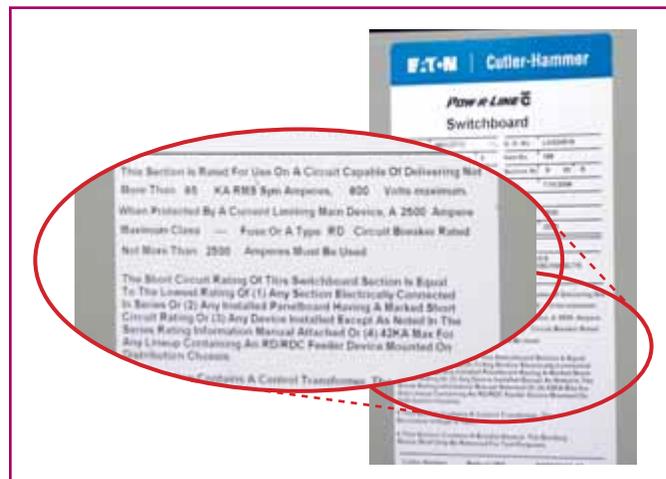

EXHIBIT 110.10 A short-circuit current rating marking.

this *Code*. The marking or label shall be of sufficient durability to withstand the environment involved.

(2) **Reconditioned equipment.** Reconditioned equipment shall be marked with the name, trademark, or other descriptive marking by which the organization responsible for reconditioning the electrical equipment can be identified, along with the date of the reconditioning.

Reconditioned equipment shall be identified as “reconditioned” and approval of the reconditioned equipment shall not be based solely on the equipment’s original listing.

Exception: In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the equipment, the markings indicated in 110.21(A)(2) shall not be required.

Informational Note: Industry standards are available for application of reconditioned and refurbished equipment. Normal servicing of equipment that remains within a facility should not be considered reconditioning or refurbishing.

See [Exhibit 110.10](#) for an example of a short-circuit current rating marking.

(B) **Field-Applied Hazard Markings.** Where caution, warning, or danger signs or labels are required by this *Code*, the labels shall meet the following requirements:

- (1) The marking shall warn of the hazards using effective words, colors, symbols, or any combination thereof.

Informational Note: *ANSI Z535.4-2011, Product Safety Signs and Labels*, provides guidelines for suitable font sizes, words, colors, symbols, and location requirements for labels.

- (2) The label shall be permanently affixed to the equipment or wiring method and shall not be hand written.

Exception to (2): Portions of labels or markings that are variable, or that could be subject to changes, shall be permitted to be hand written and shall be legible.

- (3) The label shall be of sufficient durability to withstand the environment involved.

Informational Note: ANSI Z535.4-2011, *Product Safety Signs and Labels*, provides guidelines for the design and durability of safety signs and labels for application to electrical equipment.

110.22 Identification of Disconnecting Means.

(A) **General.** Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved.

Markings of disconnecting means must specifically identify the purpose of each piece of equipment — that is, the marking should not indicate simply “motor,” but rather “motor, water pump,” and not simply “lights,” but rather “lights, front lobby.” The markings must remain legible and not fade or wear off.

See also

408.4 and its commentary for additional requirements and information on circuit directories for switchboards and panelboards

(B) **Engineered Series Combination Systems.** Equipment enclosures for circuit breakers or fuses applied in compliance with series combination ratings selected under engineering supervision in accordance with **240.86(A)** shall be legibly marked in the field as directed by the engineer to indicate the equipment has been applied with a series combination rating. The marking shall meet the requirements in **110.21(B)** and shall be readily visible and state the following:

CAUTION — ENGINEERED SERIES
COMBINATION SYSTEM RATED _____
AMPERES. IDENTIFIED REPLACEMENT
COMPONENTS REQUIRED.

If the ratings are determined under engineering supervision, the equipment must have a durable label, as specified in **110.21(B)**, indicating that the series combination rating has been used. The warnings on replacement components are important to be followed in order to maintain the level of protection provided by the design. Likewise, when components are replaced, new or updated warning labels with information based on the new component may be necessary.

(C) **Tested Series Combination Systems.** Equipment enclosures for circuit breakers or fuses applied in compliance with the series combination ratings marked on the equipment by the manufacturer in accordance with **240.86(B)** shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall meet the requirements in **110.21(B)** and shall be readily visible and state the following:

CAUTION — SERIES COMBINATION
SYSTEM RATED ____ AMPERES. IDENTIFIED
REPLACEMENT COMPONENTS REQUIRED.

Informational Note: See IEEE 3004.5-2014 *Recommended Practice for the Application of Low-Voltage Circuit Breakers in*

Industrial and Commercial Power Systems, for further information on series tested systems.

110.23 Current Transformers. Unused current transformers associated with potentially energized circuits shall be short-circuited.

110.24 Available Fault Current.

(A) **Field Marking.** Service equipment at other than dwelling units shall be legibly marked in the field with the maximum available fault current. The field marking(s) shall include the date the fault-current calculation was performed and be of sufficient durability to withstand the environment involved. The calculation shall be documented and made available to those authorized to design, install, inspect, maintain, or operate the system.

Informational Note: The available fault-current marking(s) addressed in **110.24** is related to required short-circuit current ratings of equipment. *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*, provides assistance in determining the severity of potential exposure, planning safe work practices, and selecting personal protective equipment.

(B) **Modifications.** When modifications to the electrical installation occur that affect the maximum available fault current at the service, the maximum available fault current shall be verified or recalculated as necessary to ensure the service equipment ratings are sufficient for the maximum available fault current at the line terminals of the equipment. The required field marking(s) in **110.24(A)** shall be adjusted to reflect the new level of maximum available fault current.

Exception: The field marking requirements in 110.24(A) and 110.24(B) shall not be required in industrial installations where conditions of maintenance and supervision ensure that only qualified persons service the equipment.

To be used safely, equipment must have an interrupting rating or short-circuit current rating equal to or greater than the available fault current. Any equipment operating with ratings less than the available fault current is potentially unsafe.

Existing electrical distribution systems often experience change over the life of the system. As the system ages, the supply network to which it is connected is impacted by growth and is forced to increase capacity or increase efficiency by reducing transformer impedance. In some cases, alternative energy systems are added to existing installations. Such changes to the electrical distribution system can result in an increase of the available fault current. This increase in available fault current can exceed the ratings of the originally installed equipment violating **110.9** and **110.10**, creating an unsafe condition. This section requires an initial marking of maximum available fault current as well as the requirement to update the information when the system is modified.

The available fault current must be known to complete an arc-flash hazard risk assessment per Section 130.5 of *NFPA 70E, Standard for Electrical Safety in the Workplace*. This assessment is used to determine the arc-flash protection boundary and required PPE in accordance with *NFPA 70E*, Section 130.5(B) and 130.5(C). The equipment must then be

EXHIBIT 110.11 An example of locking hardware that is not readily removable or transferable. (Courtesy of Schneider Electric)

marked with the incident energy or required level of PPE per 130.5(C). Additionally, per *NFPA 70E* 130.5, an arc-flash hazard assessment is also required to be updated when major modifications or renovations take place. The assessment must be reviewed periodically but not less than every 5 years to account for changes in the electrical distribution system that could affect the original arc-flash assessment.

110.25 Lockable Disconnecting Means. If a disconnecting means is required to be lockable open elsewhere in this *Code*, it shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.

Exception: Locking provisions for a cord-and-plug connection shall not be required to remain in place without the lock installed.

The means to lock the switch or circuit breaker in the open position must be an integral part of the enclosure or be an accessory that is not readily removed from the switch or circuit breaker. Portable locking mechanisms that are intended for temporary applications are not acceptable means of compliance. See [Exhibit 110.11](#).

Part II. 1000 Volts, Nominal, or Less

110.26 Spaces About Electrical Equipment. Access and working space shall be provided and maintained about all electrical equipment to permit ready and safe operation and maintenance of such equipment.

Spaces about electrical equipment are divided into two separate and distinct categories: working space and dedicated equipment space. The term *working space* generally applies to the protection of the worker, and *dedicated equipment space* applies to the space reserved for future access to electrical equipment and to protection of the equipment from intrusion by nonelectrical equipment. Storage of material that blocks

access or prevents safe work practices must be avoided at all times. The performance requirements for all spaces about electrical equipment are set forth in this section.

(A) Working Space. Working space for equipment operating at 1000 volts, nominal, or less to ground and likely to require examination, adjustment, servicing, or maintenance while energized shall comply with the dimensions of [110.26\(A\)\(1\)](#), [\(A\)\(2\)](#), [\(A\)\(3\)](#), and [\(A\)\(4\)](#) or as required or permitted elsewhere in this *Code*.

Informational Note: *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*, provides guidance, such as determining severity of potential exposure, planning safe work practices, arc flash labeling, and selecting personal protective equipment.

The intent is to provide enough space for the performance of any of the operations listed without jeopardizing workers. Minimum working clearances are not required if the equipment is not likely to require examination, adjustment, servicing, or maintenance while energized. However, access and working space are still required by the opening paragraph of [110.26](#).

Examples of such equipment include panelboards, switches, circuit breakers, controllers, and controls on heating and air-conditioning equipment. Note that the word “examination” includes tasks such as checking for the presence of voltage using a portable voltmeter.

(1) Depth of Working Space. The depth of the working space in the direction of live parts shall not be less than that specified in [Table 110.26\(A\)\(1\)](#) unless the requirements of [110.26\(A\)\(1\)\(a\)](#), [\(A\)\(1\)\(b\)](#), or [\(A\)\(1\)\(c\)](#) are met. Distances shall be measured from the exposed live parts or from the enclosure or opening if the live parts are enclosed.

[Table 110.26\(A\)\(1\)](#) provides requirements for clearances from equipment to grounded or ungrounded objects and exposed live parts based on the circuit voltage to ground. See [Exhibit 110.12](#) for the general working clearance requirements for each of the three conditions listed in [Table 110.26\(A\)\(1\)](#).

Examples of common electrical supply systems covered in the 0 to 150 volts-to-ground group are 120/240-volt, single-phase, 3-wire and 208Y/120-volt, 3-phase, 4-wire systems. Examples of common electrical

TABLE 110.26(A)(1) Working Spaces

Nominal Voltage to Ground	Minimum Clear Distance		
	Condition 1	Condition 2	Condition 3
0–150	900 mm (3 ft)	900 mm (3 ft)	900 mm (3 ft)
151–600	900 mm (3 ft)	1.0 m (3 ft 6 in.)	1.2 m (4 ft)
601–1000	900 mm (3 ft)	1.2 m (4 ft)	1.5 m (5 ft)

Note: Where the conditions are as follows:

Condition 1 — Exposed live parts on one side of the working space and no live or grounded parts on the other side of the working space, or exposed live parts on both sides of the working space that are effectively guarded by insulating materials.

Condition 2 — Exposed live parts on one side of the working space and grounded parts on the other side of the working space. Concrete, brick, or tile walls shall be considered as grounded.

Condition 3 — Exposed live parts on both sides of the working space.

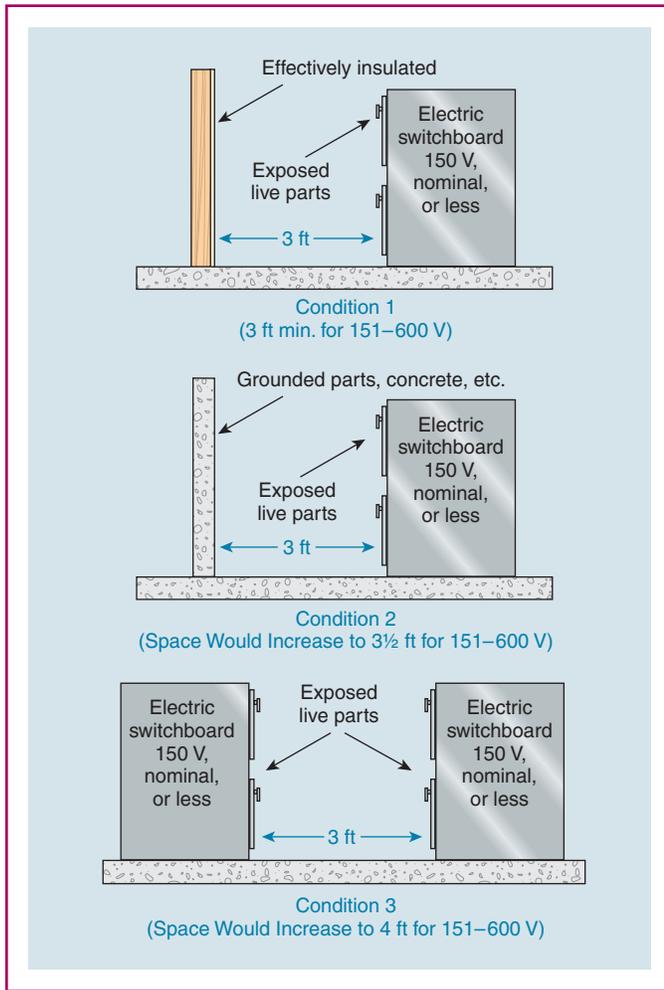

EXHIBIT 110.12 Distances measured from the live parts if the live parts are exposed or from the enclosure front if the live parts are enclosed.

supply systems covered in the 151 to 1000 volts-to-ground group are 240-volt, 3-phase, 3-wire; 480Y/277-volt, 3-phase, 4-wire; and 480-volt, 3-phase, 3-wire (ungrounded and corner grounded) systems. Where an ungrounded system is used, the voltage to ground (by definition) is the greatest voltage between the given conductor and any other conductor of the circuit. For example, the voltage to ground for a 480-volt ungrounded delta system is 480 volts. For assemblies such as switchboards, switchgear, or motor-control centers that are accessible from the back and expose live parts, the working clearance dimensions are required at the rear of the equipment. For Condition 3, where enclosures are on opposite sides of the working space, the clearance for only one working space is required.

(a) *Dead-Front Assemblies.* Working space shall not be required in the back or sides of assemblies, such as dead-front switchboards, switchgear, or motor control centers, where all connections and all renewable or adjustable parts, such as fuses or switches, are accessible from locations other than the back or sides. Where rear access is required to work on nonelectrical parts on the back of enclosed equipment, a minimum horizontal working space of 762 mm (30 in.) shall be provided.

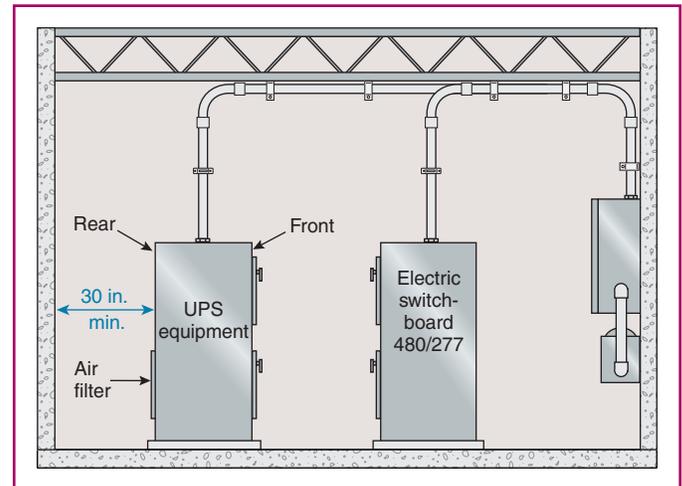

EXHIBIT 110.13 An example of the 30-inch minimum working space at the rear of equipment to allow work on nonelectrical parts, such as the replacement of an air filter.

In many cases, equipment of “dead-front” assemblies requires only front access. The workspace described in 110.26(A)(1) is required for any side of the equipment from which access to live parts or other maintenance is required. For equipment that requires rear access for nonelectrical maintenance, such as replacing a filter, a reduced working space of at least 30 inches must be provided. Exhibit 110.13 shows a reduced working space of 30 inches at the rear of equipment to allow work on nonelectrical parts.

(b) *Low Voltage.* By special permission, smaller working spaces shall be permitted where all exposed live parts operate at not greater than 30 volts rms, 42 volts peak, or 60 volts dc.

(c) *Existing Buildings.* In existing buildings where electrical equipment is being replaced, Condition 2 working clearance shall be permitted between dead-front switchboards, switchgear, panelboards, or motor control centers located across the aisle from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment on both sides of the aisle from being open at the same time and qualified persons who are authorized will service the installation.

This section permits some relief for existing equipment being replaced if it is not practical to increase the existing work space. Exhibit 110.14 illustrates this relief for existing buildings.

(2) **Width of Working Space.** The width of the working space in front of the electrical equipment shall be the width of the equipment or 762 mm (30 in.), whichever is greater. In all cases, the work space shall permit at least a 90 degree opening of equipment doors or hinged panels.

Regardless of the width of the electrical equipment, the working space cannot be less than 30 inches wide. This space allows an individual to have at least shoulder-width space in front of the equipment. The 30-inch measurement can be made from either the left or the right edge of the equipment and can overlap other electrical equipment, provided

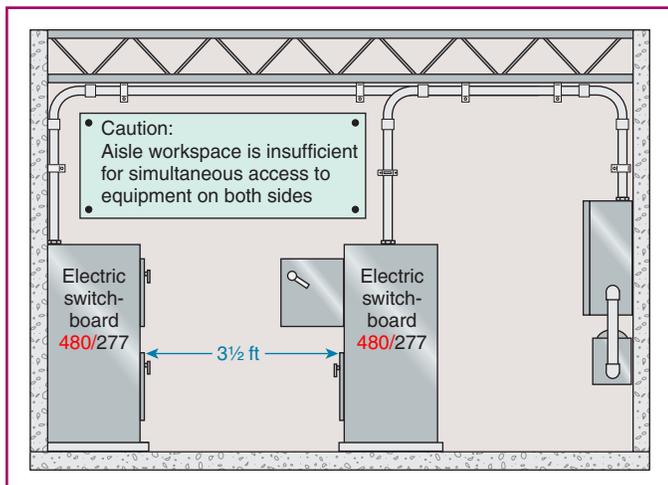

EXHIBIT 110.14 A permitted reduction from a Condition 3 to a Condition 2 clearance.

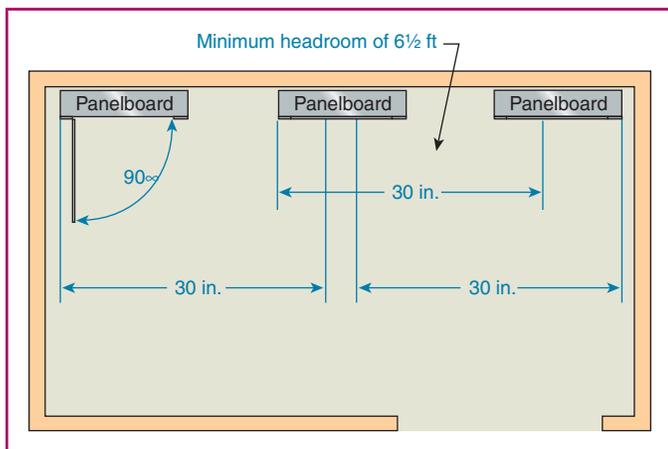

EXHIBIT 110.15 The 30-inch-wide front working space, which is not required to be directly centered on the electrical equipment and can overlap other electrical equipment.

the equipment does not extend into the working space of the other equipment. If the equipment is wider than 30 inches, the space must be equal to the width of the equipment. Exhibit 110.15 illustrates the 30-inch width requirement.

Sufficient depth in the working space is also required to allow a panel or a door to open at least 90 degrees. If doors or hinged panels are wider than 3 feet, more than a 3-foot deep working space must be provided to allow a full 90-degree opening. (See Exhibit 110.16.) Doors are often part of bolted equipment covers. The 90-degree requirement only applies to the hinged door. It does not require that the bolted cover be capable of swinging 90 degrees.

(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to a height of 2.0 m (6½ ft) or the height of the equipment, whichever is greater. Within the height requirements of this section, other equipment that is associated with the electrical installation and is located

EXHIBIT 110.16 A full 90-degree opening of an equipment door in order to ensure a safe working approach.

above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment.

Exception No. 1: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the height of the working space is less than 2.0 m (6½ ft)

Exception No. 2: Meters that are installed in meter sockets shall be permitted to extend beyond the other equipment. The meter socket shall be required to follow the rules of this section.

Exception No. 3: On battery systems mounted on open racks, the top clearance shall comply with 480.10(D).

This requirement allows the placement of a 12 inch × 12 inch wireway on the wall directly above or below a 6-inch-deep panelboard without encroaching on the working space. The requirement prohibits large differences in depth of equipment below or above other equipment that specifically requires working space. Freestanding, dry-type transformers are not permitted to be installed where they extend into the work space for a wall-mounted panelboard. This compromises clear access to the panelboard.

(4) Limited Access. Where equipment operating at 1000 volts, nominal, or less to ground and likely to require examination, adjustment, servicing, or maintenance while energized is required by installation instructions or function to be located in a space with limited access, all of the following shall apply:

(a) Where equipment is installed above a lay-in ceiling, there shall be an opening not smaller than 559 mm × 559 mm (22 in. × 22 in.), or in a crawl space, there shall be an accessible opening not smaller than 559 mm × 762 mm (22 in. × 30 in.).

(b) The width of the working space shall be the width of the equipment enclosure or a minimum of 762 mm (30 in.), whichever is greater.

(c) All enclosure doors or hinged panels shall be capable of opening a minimum of 90 degrees.

(d) The space in front of the enclosure shall comply with the depth requirements of [Table 110.26\(A\)\(1\)](#). The maximum height of the working space shall be the height necessary to install the equipment in the limited space. A horizontal ceiling structural member or access panel shall be permitted in this space.

This requirement was formerly located in [424.66](#). A typical application of this requirement is the installation of duct heaters and other ventilation equipment located above suspended ceilings. The workspace is usually limited and workers are usually performing maintenance from ladders.

(5) Separation from High-Voltage Equipment. Where switches, cutouts, or other equipment operating at 1000 volts, nominal, or less are installed in a vault, room, or enclosure where there are exposed live parts or exposed wiring operating over 1000 volts, nominal, the high-voltage equipment shall be effectively separated from the space occupied by the low-voltage equipment by a suitable partition, fence, or screen.

This requirement correlates with the separation requirement in [110.31](#) to clarify that separation must be provided from equipment operating at over 1000 volts.

(B) Clear Spaces. Working space required by this section shall not be used for storage. When normally enclosed live parts are exposed for inspection or servicing, the working space, if in a passageway or general open space, shall be suitably guarded.

Prohibited storage includes portable equipment on rollers. [Exhibit 110.17](#) shows an equipment location that is free of storage. This section and the rest of [110.26](#) do not prohibit the placement of panelboards in corridors or passageways. When the covers of corridor-

EXHIBIT 110.17 An equipment location that is free of storage to allow the equipment to be worked on safely. (Courtesy of the International Association of Electrical Inspectors)

mounted panelboards are removed for servicing or other work, access to the area around the panelboard should be guarded or limited to prevent injury to unqualified persons using the corridor.

(C) Entrance to and Egress from Working Space.

(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to and egress from working space about electrical equipment.

The requirements in this section provide access to and egress from electrical equipment. However, the primary intent is to provide egress from the area so that workers can escape if an arc-flash incident occurs.

(2) Large Equipment. For equipment rated 1200 amperes or more and over 1.8 m (6 ft) wide that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high at each end of the working space.

A single entrance to and egress from the required working space shall be permitted where either of the conditions in [110.26\(C\)\(2\)\(a\)](#) or [\(C\)\(2\)\(b\)](#) is met.

(a) *Unobstructed Egress.* Where the location permits a continuous and unobstructed way of egress travel, a single entrance to the working space shall be permitted.

(b) *Extra Working Space.* Where the depth of the working space is twice that required by [110.26\(A\)\(1\)](#), a single entrance shall be permitted. It shall be located such that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in [Table 110.26\(A\)\(1\)](#) for equipment operating at that voltage and in that condition.

[Exhibits 110.18](#) and [110.19](#) illustrate access and entrance requirements for working spaces. [Exhibit 110.20](#) shows an unacceptable and hazardous work space arrangement. See [Exhibits 110.21](#) and [110.22](#) for a representation of the single egress requirements for large equipment.

(3) Personnel Doors. Where equipment rated 800 A or more that contains overcurrent devices, switching devices, or control devices is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with listed panic hardware.

The requirements in this section are based on equipment rated 800 amperes or more and not on the width of the equipment. The 25-foot measurement for the personnel door(s) is made from the nearest edge of the working space. It applies to the personnel door(s) that provide access to and egress from the room containing the working space.

Not every electrical installation is in an equipment room. Where electrical installations are in a room, personnel doors that are up to 25 feet from the working space are required to have listed panic hardware and they must open in the direction of egress from the area. The requirement for listed panic hardware is independent of the need for two exits from the working space. [Exhibit 110.23](#) shows one of the required exits.

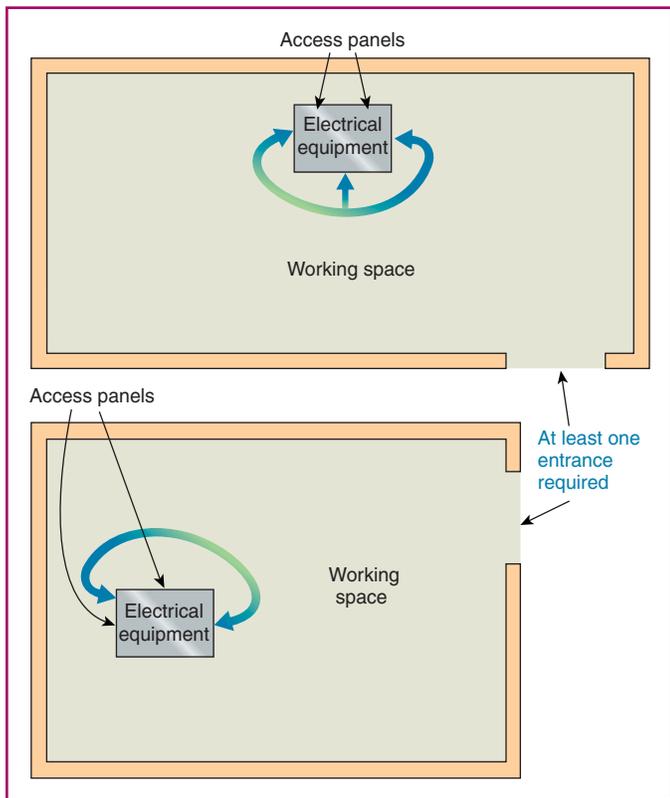

EXHIBIT 110.18 At least one entrance is required to provide access to the working space around electrical equipment.

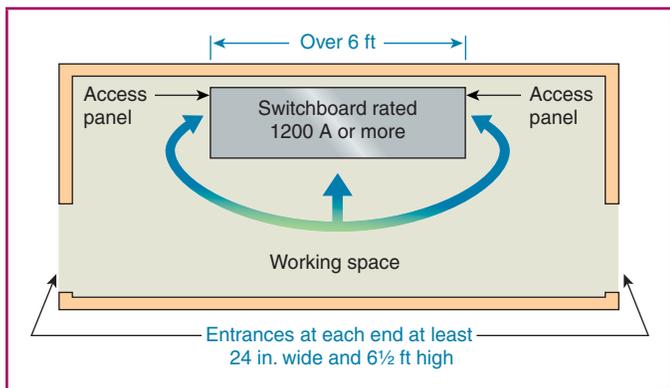

EXHIBIT 110.19 For equipment rated 1200 amperes or more and over 6 feet wide, one entrance not less than 24 inches wide and 6½ feet high is required at each end.

Door opening hardware must not require turning a door knob or similar action that may preclude quick exit from the area in the event of an emergency. This requirement allows exit from the equipment room by an injured worker without having to turn knobs or pull doors open.

(D) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, switchgear, panelboards, or motor control centers installed indoors. Control by automatic means only shall not be permitted. Additional lighting outlets shall not be required where the work space is illuminated

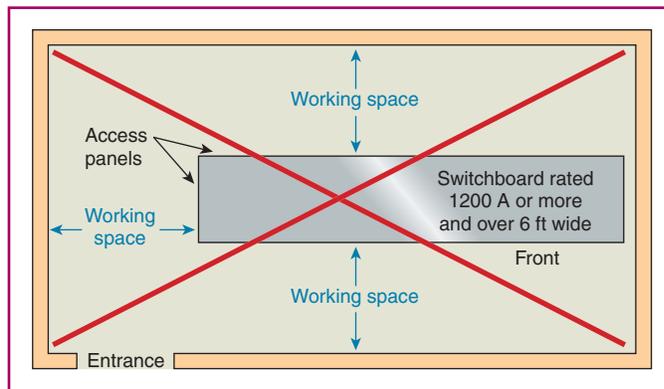

EXHIBIT 110.20 An unacceptable arrangement of a large switchboard in which a worker could be trapped behind arcing electrical equipment.

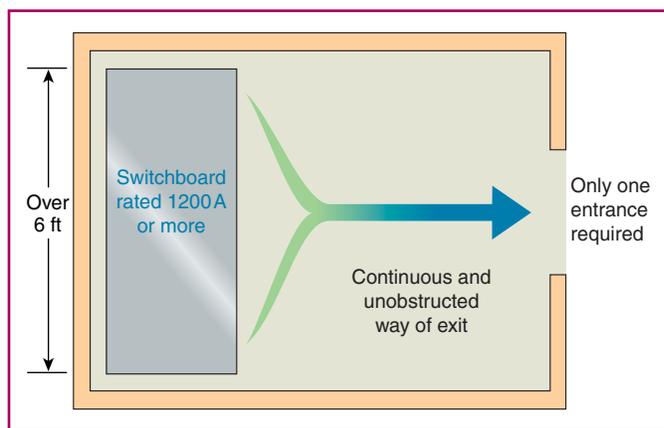

EXHIBIT 110.21 An equipment location that allows a continuous and unobstructed way of exit travel.

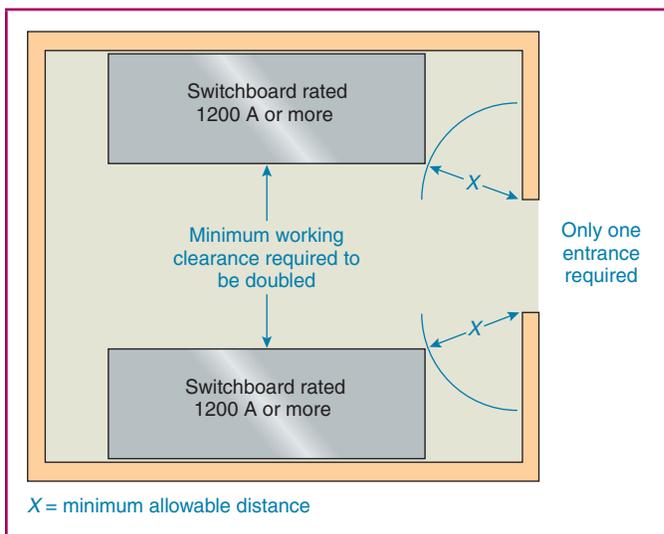

EXHIBIT 110.22 A working space with one entrance, which is permitted if the working space required by 110.26(A) is doubled [see Table 110.26(A)(1) for permitted dimensions of X].

EXHIBIT 110.23 An installation of large equipment showing one of the required exits. (Courtesy of the International Association of Electrical Inspectors)

by an adjacent light source or as permitted by 210.70(A)(1), Exception No. 1, for switched receptacles.

Automatic lighting control through devices such as occupancy sensors and similar devices would not be prohibited, but a manual means to bypass the automatic control is required.

(E) Dedicated Equipment Space. All switchboards, switchgear, panelboards, and motor control centers shall be located in dedicated spaces and protected from damage.

Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.

(1) Indoor. Indoor installations shall comply with 110.26(E)(1)(a) through (E)(1)(d).

(a) *Dedicated Electrical Space.* The space equal to the width and depth of the equipment and extending from the floor to a height of 1.8 m (6 ft) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, leak protection apparatus, or other equipment foreign to the electrical installation shall be located in this zone.

Exception: Suspended ceilings with removable panels shall be permitted within the 1.8-m (6-ft) zone.

(b) *Foreign Systems.* The area above the dedicated space required by 110.26(E)(1)(a) shall be permitted to contain foreign systems, provided protection is installed to avoid damage to the electrical equipment from condensation, leaks, or breaks in such foreign systems.

(c) *Sprinkler Protection.* Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.

(d) *Suspended Ceilings.* A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.

This requirement only applies to switchboards, panelboards, switchgear, or motor control centers. The dedicated electrical space extends the footprint of the equipment from the floor to a height of 6 feet above the height of the equipment or to the structural ceiling (whichever is lower). The dedicated space is required to be clear of piping, ducts, leak protection apparatus, or equipment foreign to the electrical installation. Plumbing, heating, ventilation, and air-conditioning piping, ducts, and equipment must be installed outside this space. Busways, conduits, raceways, and cables are permitted to enter equipment through this zone.

Foreign systems installed directly above the dedicated space reserved for electrical equipment are required to include protective equipment that ensures that occurrences such as leaks, condensation, and even breaks do not damage the electrical equipment located below.

Sprinkler protection is permitted for the dedicated space. The sprinkler or other suppression system piping must comply with 110.26(E)(1).

A dropped, suspended, or similar ceiling is permitted to be located directly in the dedicated space, because they are not considered structural ceilings. Building structural members are also permitted in this space.

Exhibits 110.24, 110.25, and 110.26 illustrate the two distinct indoor installation spaces required by 110.26(A) and 110.26(E), that is, the working space and the dedicated electrical space.

In Exhibit 110.24, the dedicated electrical space is reserved for the installation of electrical equipment and for the installation of conduits, cable trays, and so forth, entering or exiting that equipment. The outlined area in front of the electrical equipment in Exhibit 110.24 is the working space required by 110.26(A). Note that sprinkler protection is afforded the entire dedicated electrical space and working space without actually entering either space. Also note that the exhaust duct is not located in or directly above the dedicated electrical space.

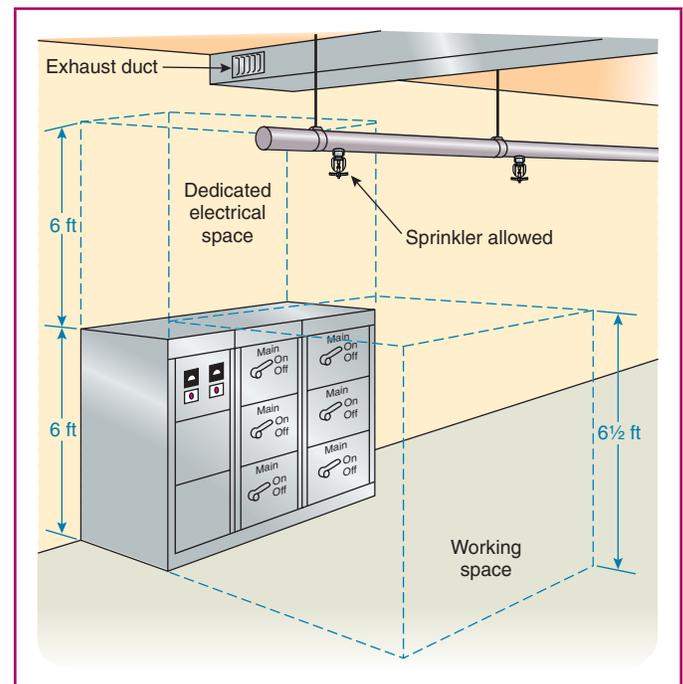

EXHIBIT 110.24 The two distinct indoor installation spaces: the working space and the dedicated electrical space.

EXHIBIT 110.25 The working space in front of a panelboard. (This illustration supplements the dedicated electrical space shown in Exhibit 110.24.)

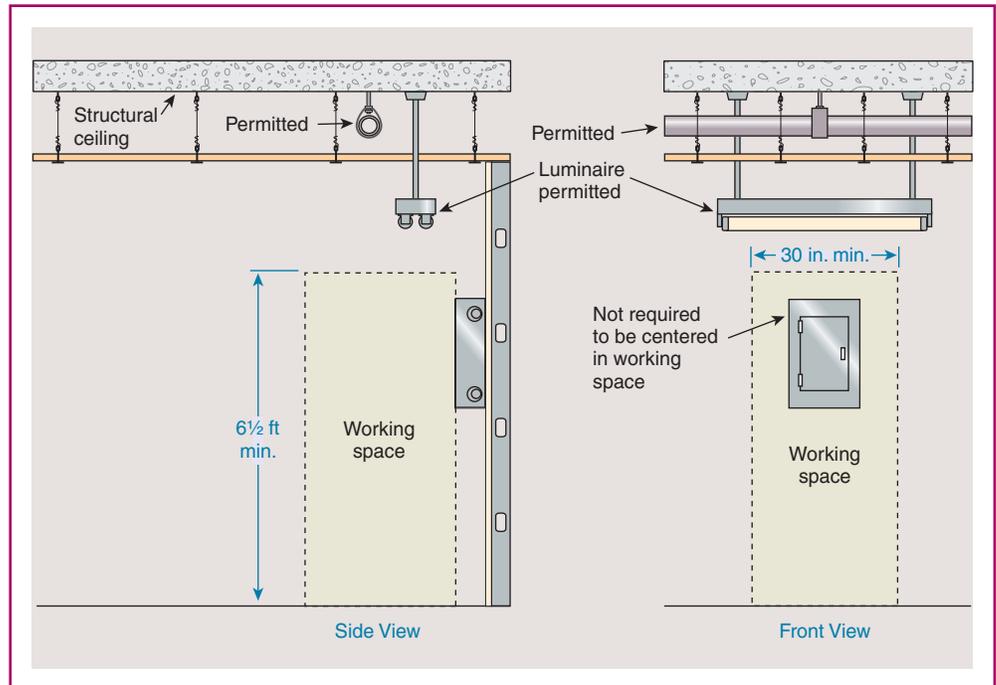

EXHIBIT 110.26 The dedicated electrical space above and below a panelboard.

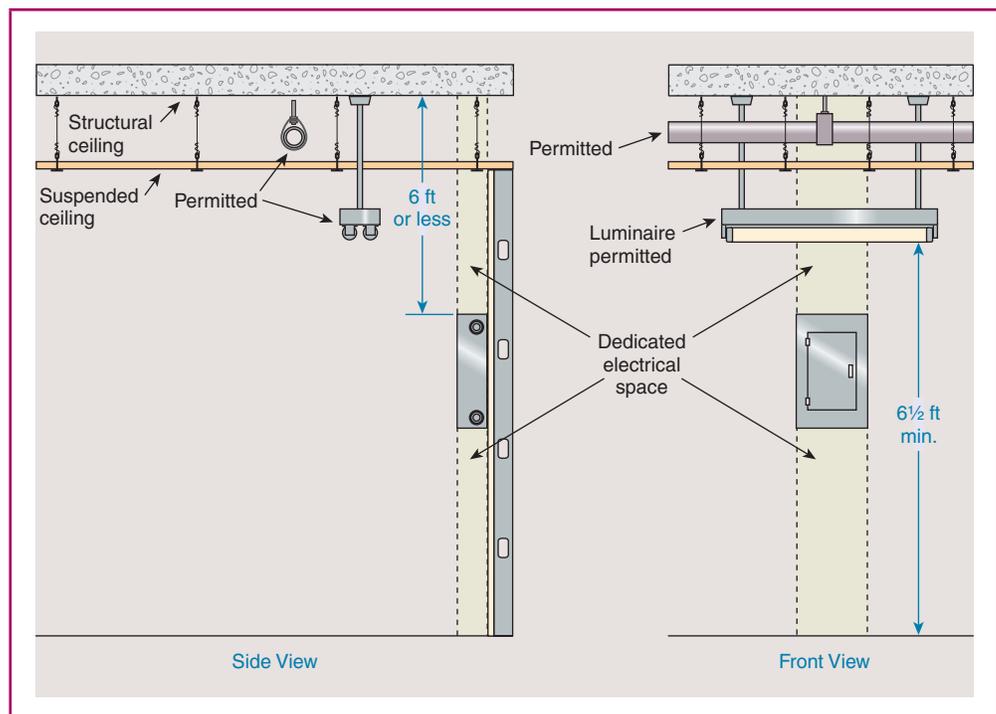

Exhibit 110.25 illustrates the working space required in front of the panelboard by 110.26(A). No equipment, electrical or otherwise, is allowed in the working space. Exhibit 110.26 illustrates the dedicated electrical space above and below the panelboard required by 110.26(E)(1). This space is for the cables, raceways, and so on, that run to and from the panelboard.

(2) Outdoor. Outdoor installations shall comply with 110.26(E)(2)(a) through (c).

(a) Installation Requirements. Outdoor electrical equipment shall be the following:

- (1) Installed in identified enclosures
- (2) Protected from accidental contact by unauthorized personnel or by vehicular traffic
- (3) Protected from accidental spillage or leakage from piping systems

(b) **Work Space.** The working clearance space shall include the zone described in 110.26(A). No architectural appurtenance or other equipment shall be located in this zone.

Exception: Structural overhangs or roof extensions shall be permitted in this zone.

Any excavation or driving of steel into the ground for the placement of fencing, vehicle stops, or bollards should be done only after a thorough investigation of the belowgrade wiring.

(c) **Dedicated Equipment Space.** The space equal to the width and depth of the equipment, and extending from grade to a height of 1.8 m (6 ft) above the equipment, shall be dedicated to the electrical installation. No piping or other equipment foreign to the electrical installation shall be located in this zone.

(F) **Locked Electrical Equipment Rooms or Enclosures.** Electrical equipment rooms or enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered accessible to qualified persons.

Identified outdoor use enclosures are tested for exclusion of rain and are inherently protected against accidental spillage or leakage from piping systems.

110.27 Guarding of Live Parts.

(A) **Live Parts Guarded Against Accidental Contact.** Except as elsewhere required or permitted by this Code, live parts of electrical equipment operating at 50 to 1000 volts, nominal shall be guarded against accidental contact by approved enclosures or by any of the following means:

- (1) By location in a room, vault, or similar enclosure that is accessible only to qualified persons.
- (2) By permanent, substantial partitions or screens arranged so that only qualified persons have access to the space within reach of the live parts. Any openings in such partitions or screens shall be sized and located so that persons are not likely to come into accidental contact with the live parts or to bring conducting objects into contact with them.
- (3) By location on a balcony, gallery, or platform elevated and arranged so as to exclude unqualified persons.
- (4) By elevation above the floor or other working surface as follows:
 - a. A minimum of 2.5 m (8 ft) for 50 volts to 300 volts between ungrounded conductors
 - b. A minimum of 2.6 m (8 ft 6 in.) for 301 volts to 600 volts between ungrounded conductors
 - c. A minimum of 2.62 m (8 ft 7 in.) for 601 volts to 1000 volts between ungrounded conductors

Live parts of electrical equipment should be covered, shielded, enclosed, or otherwise protected by covers, barriers, or platforms to prevent contact by persons or objects.

Contact conductors used for traveling cranes are permitted by 610.13(B) and 610.21(A) to be bare because they are protected from contact by elevation. Although contact conductors obviously have to be

bare for contact shoes on the moving member to make contact with the conductor, guards can be placed near the conductor to prevent accidental contact with persons and still have slots or spaces through which the moving contacts can operate.

The NEC also recognizes the guarding of live parts by elevation. The elevation levels correlate with requirements in ANSI/IEEE C2, *National Electrical Safety Code*.

(B) **Prevent Physical Damage.** In locations where electrical equipment is likely to be exposed to physical damage, enclosures or guards shall be so arranged and of such strength as to prevent such damage.

(C) **Warning Signs.** Entrances to rooms and other guarded locations that contain exposed live parts shall be marked with conspicuous warning signs forbidding unqualified persons to enter. The marking shall meet the requirements in 110.21(B).

Informational Note: For motors, see 430.232 and 430.233. For over 1000 volts, see 110.34.

110.28 Enclosure Types. Enclosures (other than surrounding fences or walls covered in 110.31) of switchboards, switchgear, panelboards, industrial control panels, motor control centers, meter sockets, enclosed switches, transfer switches, power outlets, circuit breakers, adjustable-speed drive systems, pullout switches, portable power distribution equipment, termination boxes, general-purpose transformers, fire pump controllers, fire pump motors, and motor controllers, rated not over 1000 volts nominal and intended for such locations, shall be marked with an enclosure-type number as shown in Table 110.28.

Table 110.28 shall be used for selecting these enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

Enclosures that comply with the requirements for more than one type of enclosure may be marked with multiple designations. Enclosures marked with a type may also be marked as follows:

A Type 1 may be marked "Indoor Use Only."

A Type 3, 3S, 4, 4X, 6, or 6P may be marked "Raintight."

A Type 3R may be marked "Rainproof."

A Type 4, 4X, 6, or 6P may be marked "Watertight."

A Type 4X or 6P may be marked "Corrosion Resistant."

A Type 2, 5, 12, 12K, or 13 may be marked "Driptight."

A Type 3, 3S, 5, 12K, or 13 may be marked "Dusttight."

For equipment designated "raintight," testing designed to simulate exposure to a beating rain will not result in entrance of water. For equipment designated "rainproof," testing designed to simulate exposure to a beating rain will not interfere with the operation of the apparatus or result in wetting of live parts and wiring within the enclosure. "Watertight" equipment is constructed so that water does not enter the enclosure when subjected to a stream of water. "Corrosion-resistant"

TABLE 110.28 Enclosure Selection

Provides a Degree of Protection Against the Following Environmental Conditions	For Outdoor Use									
	Enclosure Type Number									
	3	3R	3S	3X	3RX	3SX	4	4X	6	6P
Incidental contact with the enclosed equipment	X	X	X	X	X	X	X	X	X	X

*Mechanism shall be operable when ice covered.

Informational Note No. 1: The term *raintight* is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 4, 4X, 6, and 6P. The term *rainproof* is typically used in conjunction with Enclosure Types 3R and 3RX. The term *watertight* is typically used in conjunction with Enclosure Types 4, 4X, 6, and 6P. The term *driptight* is typically used in conjunction with Enclosure Types 2, 5, 12, 12K, and 13. The term *dusttight* is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 5, 12, 12K, and 13.

Informational Note No. 2: Ingress protection (IP) ratings may be found in ANSI/IEC 60529, *Degrees of Protection Provided by Enclosures*. IP ratings are not a substitute for Enclosure Type ratings.

equipment is constructed so that it provides a degree of protection against exposure to corrosive agents such as salt spray. “Driptight” equipment is constructed so that falling moisture or dirt does not enter the enclosure. “Dusttight” equipment is constructed so that circulating or airborne dust does not enter the enclosure.

Article 100 defines the term *weatherproof* as “constructed or protected so that exposure to the weather will not interfere with successful operation.” Rainproof, raintight, or watertight equipment can fulfill the requirements of this definition where varying weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

Exhibit 110.27 illustrates a label for a transformer. The circled area on the label indicates the enclosure type, which is a Type 3R.

Part III. Over 1000 Volts, Nominal

110.30 General. Conductors and equipment used on circuits over 1000 volts, nominal, shall comply with Part I of this article and with 110.30 through 110.41, which supplement or modify Part I. In no case shall the provisions of this part apply to equipment on the supply side of the service point.

Typical equipment covered by Part III of Article 110 is shown in Exhibit 110.28.

110.31 Enclosure for Electrical Installations. Electrical installations in a vault, room, or closet or in an area surrounded

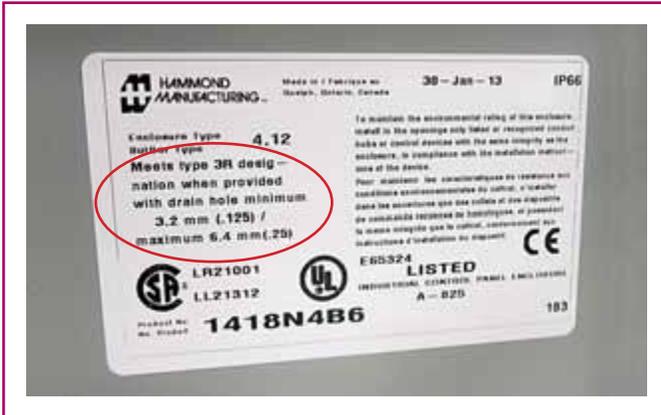

EXHIBIT 110.27 A typical label for a transformer enclosure, showing an enclosure type rating. (Courtesy of Hammond Manufacturing)

EXHIBIT 110.28 Medium voltage switchgear.

by a wall, screen, or fence, access to which is controlled by a lock(s) or other approved means, shall be considered to be accessible to qualified persons only. The type of enclosure used in a given case shall be designed and constructed according to the nature and degree of the hazard(s) associated with the installation.

TABLE 110.31 Minimum Distance from Fence to Live Parts

Nominal Voltage	Minimum Distance to Live Parts	
	m	ft
1001–13,799	3.05	10
13,800–230,000	4.57	15
Over 230,000	5.49	18

Note: For clearances of conductors for specific system voltages and typical BIL ratings, see ANSI/IEEE C2-2012, *National Electrical Safety Code*.

For installations other than equipment as described in 110.31(D), a wall, screen, or fence shall be used to enclose an outdoor electrical installation to deter access by persons who are not qualified. A fence shall not be less than 2.1 m (7 ft) in height or a combination of 1.8 m (6 ft) or more of fence fabric and a 300 mm (1 ft) or more extension utilizing three or more strands of barbed wire or equivalent. The distance from the fence to live parts shall be not less than given in Table 110.31.

Informational Note: See Article 450 for construction requirements for transformer vaults.

(A) Electrical Vaults. Where an electrical vault is required or specified for conductors and equipment 110.31(A)(1) to (A)(5) shall apply.

(1) Walls and Roof. The walls and roof shall be constructed of materials that have adequate structural strength for the conditions, with a minimum fire rating of 3 hours. For the purpose of this section, studs and wallboard construction shall not be permitted.

(2) Floors. The floors of vaults in contact with the earth shall be of concrete that is not less than 102 mm (4 in.) thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed on it and a minimum fire resistance of 3 hours.

(3) Doors. Each doorway leading into a vault from the building interior shall be provided with a tight-fitting door that has a minimum fire rating of 3 hours. The authority having jurisdiction shall be permitted to require such a door for an exterior wall opening where conditions warrant.

Exception to (1), (2), and (3): Where the vault is protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction with a 1-hour rating shall be permitted.

(4) Locks. Doors shall be equipped with locks, and doors shall be kept locked, with access allowed only to qualified persons. Personnel doors shall swing out and be equipped with panic bars, pressure plates, or other devices that are normally latched but that open under simple pressure.

(5) Transformers. Where a transformer is installed in a vault as required by [Article 450](#), the vault shall be constructed in accordance with the requirements of [Part III](#) of [Article 450](#).

Informational Note No. 1: For additional information, see ANSI/ASTM E119-2015, *Method for Fire Tests of Building Construction and Materials*, and NFPA 80-2016, *Standard for Fire Doors and Other Opening Protectives*.

Informational Note No. 2: A typical 3-hour construction is 150 mm (6 in.) thick reinforced concrete.

These requirements apply if a vault is required or specified. The requirements for doors and locks are based on the requirement in [450.43](#). Although the language in [Article 450](#) is similar to this section, [Article 450](#) has some additional requirements for door sills and ventilation that would apply if the vault contains a liquid-insulated transformer.

(B) Indoor Installations.

(1) In Places Accessible to Unqualified Persons. Indoor electrical installations that are accessible to unqualified persons shall be made with metal-enclosed equipment. Switchgear, transformers, pull boxes, connection boxes, and other similar associated equipment shall be marked with appropriate caution signs. Openings in ventilated dry-type transformers or similar openings in other equipment shall be designed so that foreign objects inserted through these openings are deflected from energized parts.

See [Exhibit 110.29](#).

(2) In Places Accessible to Qualified Persons Only. Indoor electrical installations considered accessible only to qualified persons in accordance with this section shall comply with [110.34](#), [110.36](#), and [490.24](#).

(C) Outdoor Installations.

(1) In Places Accessible to Unqualified Persons. Outdoor electrical installations that are open to unqualified persons shall comply with [Parts I, II](#), and [III](#) of [Article 225](#).

EXHIBIT 110.29 Enclosures of equipment operations at over 1000 volts required to have the warning label specified in [110.31\(B\)\(1\)](#). (Courtesy of the International Association of Electrical Inspectors)

(2) In Places Accessible to Qualified Persons Only. Outdoor electrical installations that have exposed live parts shall be accessible to qualified persons only in accordance with the first paragraph of this section and shall comply with [110.34](#), [110.36](#), and [490.24](#).

(D) Enclosed Equipment Accessible to Unqualified Persons. Ventilating or similar openings in equipment shall be designed such that foreign objects inserted through these openings are deflected from energized parts. Where exposed to physical damage from vehicular traffic, suitable guards shall be provided. Equipment located outdoors and accessible to unqualified persons shall be designed such that exposed nuts or bolts cannot be readily removed, permitting access to live parts. Where equipment is accessible to unqualified persons and the bottom of the enclosure is less than 2.5 m (8 ft) above the floor or grade level, the enclosure door or hinged cover shall be kept locked. Doors and covers of enclosures used solely as pull boxes, splice boxes, or junction boxes shall be locked, bolted, or screwed on. Underground box covers that weigh over 45.4 kg (100 lb) shall be considered as meeting this requirement.

110.32 Work Space About Equipment. Sufficient space shall be provided and maintained about electrical equipment to permit ready and safe operation and maintenance of such equipment. Where energized parts are exposed, the minimum clear work space shall be not less than 2.0 m (6½ ft) high (measured vertically from the floor or platform) or not less than 914 mm (3 ft) wide (measured parallel to the equipment). The depth shall be as required in [110.34\(A\)](#). In all cases, the work space shall permit at least a 90 degree opening of doors or hinged panels

The width of the work space in front of electrical equipment must not be less than 3 feet.

110.33 Entrance to Enclosures and Access to Working Space.

(A) Entrance. At least one entrance to enclosures for electrical installations as described in [110.31](#) not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high shall be provided to give access to the working space about electrical equipment.

(1) Large Equipment. On switchgear and control panels exceeding 1.8 m (6 ft) in width, there shall be one entrance at each end of the equipment. A single entrance to the required working space shall be permitted where either of the conditions in [110.33\(A\)\(1\)\(a\)](#) or [\(A\)\(1\)\(b\)](#) is met.

(a) *Unobstructed Exit.* Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.

(b) *Extra Working Space.* Where the depth of the working space is twice that required by [110.34\(A\)](#), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in [Table 110.34\(A\)](#) for equipment operating at that voltage and in that condition.

Section 110.33(A) contains requirements very similar to those of 110.26(C).

See also

110.26(C)(2) and its commentary for further information, most of which also is valid for installations over 1000 volts

(2) **Guarding.** Where bare energized parts at any voltage or insulated energized parts above 1000 volts, nominal, are located adjacent to such entrance, they shall be suitably guarded.

(3) **Personnel Doors.** Where there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with listed panic hardware.

Not every electrical installation is in an equipment room. This section is also not mandating that the installation be enclosed in a room. If there are personnel doors within 25 feet from the working space, they must have panic hardware and must open in the direction of egress from the area.

(B) **Access.** Permanent ladders or stairways shall be provided to give safe access to the working space around electrical equipment installed on platforms, balconies, or mezzanine floors or in attic or roof rooms or spaces.

N 110.34 Work Space and Guarding.

(A) **Working Space.** Except as elsewhere required or permitted in this Code, equipment likely to require examination, adjustment, servicing, or maintenance while energized shall have clear working space in the direction of access to live parts of the electrical equipment and shall be not less than specified in Table 110.34(A). Distances shall be measured from the live parts, if such are exposed, or from the enclosure front or opening if such are enclosed.

TABLE 110.34(A) Minimum Depth of Clear Working Space at Electrical Equipment

Nominal Voltage to Ground	Minimum Clear Distance		
	Condition 1	Condition 2	Condition 3
1001–2500 V	900 mm (3 ft)	1.2 m (4 ft)	1.5 m (5 ft)
2501–9000 V	1.2 m (4 ft)	1.5 m (5 ft)	1.8 m (6 ft)
9001–25,000 V	1.5 m (5 ft)	1.8 m (6 ft)	2.8 m (9 ft)
25,001 V–75 kV	1.8 m (6 ft)	2.5 m (8 ft)	3.0 m (10 ft)
Above 75 kV	2.5 m (8 ft)	3.0 m (10 ft)	3.7 m (12 ft)

Note: Where the conditions are as follows:

- (1) **Condition 1** — Exposed live parts on one side of the working space and no live or grounded parts on the other side of the working space, or exposed live parts on both sides of the working space that are effectively guarded by insulating materials.
- (2) **Condition 2** — Exposed live parts on one side of the working space and grounded parts on the other side of the working space. Concrete, brick, or tile walls shall be considered as grounded.
- (3) **Condition 3** — Exposed live parts on both sides of the working space.

Exception: Working space shall not be required in back of equipment such as switchgear or control assemblies where there are no renewable or adjustable parts (such as fuses or switches) on the back and where all connections are accessible from locations other than the back. Where rear access is required to work on nonelectrical parts on the back of enclosed equipment, a minimum working space of 762 mm (30 in.) horizontally shall be provided.

(B) **Separation from Low-Voltage Equipment.** Where switches, cutouts, or other equipment operating at 1000 volts, nominal, or less are installed in a vault, room, or enclosure where there are exposed live parts or exposed wiring operating at over 1000 volts, nominal, the high-voltage equipment shall be effectively separated from the space occupied by the low-voltage equipment by a suitable partition, fence, or screen.

Exception: Switches or other equipment operating at 1000 volts, nominal, or less and serving only equipment within the high-voltage vault, room, or enclosure shall be permitted to be installed in the high-voltage vault, room, or enclosure without a partition, fence, or screen if accessible to qualified persons only.

(C) **Locked Rooms or Enclosures.** The entrance to all buildings, vaults, rooms, or enclosures containing exposed live parts or exposed conductors operating at over 1000 volts, nominal, shall be kept locked unless such entrances are under the observation of a qualified person at all times.

Permanent and conspicuous danger signs shall be provided. The danger sign shall meet the requirements in 110.21(B) and shall read as follows:

DANGER — HIGH VOLTAGE — KEEP OUT

(D) **Illumination.** Illumination shall be provided for all working spaces about electrical equipment. Control by automatic means only shall not be permitted. The lighting outlets shall be arranged so that persons changing lamps or making repairs on the lighting system are not endangered by live parts or other equipment.

The points of control shall be located so that persons are not likely to come in contact with any live part or moving part of the equipment while turning on the lights.

(E) **Elevation of Unguarded Live Parts.** Unguarded live parts above working space shall be maintained at elevations not less than required by Table 110.34(E).

TABLE 110.34(E) Elevation of Unguarded Live Parts Above Working Space

Nominal Voltage Between Phases	Elevation	
	m	ft
1001–7500 V	2.7	9
7501–35,000 V	2.9	9 ft 6 in.
Over 35 kV	Add 9.5 mm per kV above 35 kV	Add 0.37 in. per kV above 35 kV

(F) Protection of Service Equipment, Switchgear, and Industrial Control Assemblies. Pipes or ducts foreign to the electrical installation and requiring periodic maintenance or whose malfunction would endanger the operation of the electrical system shall not be located in the vicinity of the service equipment, switchgear, or industrial control assemblies. Protection shall be provided where necessary to avoid damage from condensation leaks and breaks in such foreign systems. Piping and other facilities shall not be considered foreign if provided for fire protection of the electrical installation.

The requirements of 110.34 are conditional, just like the requirements in 110.26; that is, some of the requirements are applicable only where the equipment “is likely to require examination, adjustment, servicing, or maintenance while energized.”

110.36 Circuit Conductors. Circuit conductors shall be permitted to be installed in raceways; in cable trays; as metal-clad cable Type MC; as bare wire, cable, and busbars; or as Type MV cables or conductors as provided in 300.37, 300.39, 300.40, and 300.50. Bare live conductors shall comply with 490.24.

Insulators, together with their mounting and conductor attachments, where used as supports for wires, single-conductor cables, or busbars, shall be capable of safely withstanding the maximum magnetic forces that would prevail if two or more conductors of a circuit were subjected to short-circuit current.

Exposed runs of insulated wires and cables that have a bare lead sheath or a braided outer covering shall be supported in a manner designed to prevent physical damage to the braid or sheath. Supports for lead-covered cables shall be designed to prevent electrolysis of the sheath

110.40 Temperature Limitations at Terminations. Conductors shall be permitted to be terminated based on the 90°C (194°F) temperature rating and ampacity as given in Table 310.60(C)(67) through Table 310.60(C)(86), unless otherwise identified.

110.41 Inspections and Tests.

(A) Pre-energization and Operating Tests. Where required elsewhere in this *Code*, the complete electrical system design, including settings for protective, switching, and control circuits, shall be prepared in advance and made available on request to the authority having jurisdiction and shall be tested when first installed on-site.

(B) Test Report. A test report covering the results of the tests required in 110.41(A) shall be available to the authority having jurisdiction prior to energization and made available to those authorized to install, operate, test, and maintain the system.

Part IV. Tunnel Installations over 1000 Volts, Nominal

110.51 General.

(A) Covered. The provisions of this part shall apply to the installation and use of high-voltage power distribution and

utilization equipment that is portable, mobile, or both, such as substations, trailers, cars, mobile shovels, draglines, hoists, drills, dredges, compressors, pumps, conveyors, underground excavators, and the like.

(B) Other Articles. The requirements of this part shall be additional to, or amendatory of, those prescribed in Articles 100 through 490 of this *Code*.

(C) Protection Against Physical Damage. Conductors and cables in tunnels shall be located above the tunnel floor and so placed or guarded to protect them from physical damage.

110.52 Overcurrent Protection. Motor-operated equipment shall be protected from overcurrent in accordance with Parts III, IV, and V of Article 430. Transformers shall be protected from overcurrent in accordance with 450.3.

110.53 Conductors. High-voltage conductors in tunnels shall be installed in metal conduit or other metal raceway, Type MC cable, or other approved multiconductor cable. Multiconductor portable cable shall be permitted to supply mobile equipment.

110.54 Bonding and Equipment Grounding Conductors.

(A) Grounded and Bonded. All non-current-carrying metal parts of electrical equipment and all metal raceways and cable sheaths shall be solidly grounded and bonded to all metal pipes and rails at the portal and at intervals not exceeding 300 m (1000 ft) throughout the tunnel.

(B) Equipment Grounding Conductors. An equipment grounding conductor shall be run with circuit conductors inside the metal raceway or inside the multiconductor cable jacket. The equipment grounding conductor shall be permitted to be insulated or bare.

110.55 Transformers, Switches, and Electrical Equipment. All transformers, switches, motor controllers, motors, rectifiers, and other equipment installed belowground shall be protected from physical damage by location or guarding.

110.56 Energized Parts. Bare terminals of transformers, switches, motor controllers, and other equipment shall be enclosed to prevent accidental contact with energized parts.

110.57 Ventilation System Controls. Electrical controls for the ventilation system shall be arranged so that the airflow can be reversed.

110.58 Disconnecting Means. A switch or circuit breaker that simultaneously opens all ungrounded conductors of the circuit shall be installed within sight of each transformer or motor location for disconnecting the transformer or motor. The switch or circuit breaker for a transformer shall have an ampere rating not less than the ampacity of the transformer supply conductors.

The switch or circuit breaker for a motor shall comply with the applicable requirements of [Article 430](#).

110.59 Enclosures. Enclosures for use in tunnels shall be drip-proof, weatherproof, or submersible as required by the environmental conditions. Switch or contactor enclosures shall not be used as junction boxes or as raceways for conductors feeding through or tapping off to other switches, unless the enclosures comply with [312.8](#).

Part V. Manholes and Other Electrical Enclosures Intended for Personnel Entry

Manhole working space requirements for cabling and other equipment in [Part V](#) parallel the working space requirements elsewhere in [Article 110](#).

See also

[Article 314](#) for handhole installations

110.70 General. Electrical enclosures intended for personnel entry and specifically fabricated for this purpose shall be of sufficient size to provide safe work space about electrical equipment with live parts that is likely to require examination, adjustment, servicing, or maintenance while energized. Such enclosures shall have sufficient size to permit ready installation or withdrawal of the conductors employed without damage to the conductors or to their insulation. They shall comply with the provisions of this part.

Exception: Where electrical enclosures covered by [Part V](#) of this article are part of an industrial wiring system operating under conditions of maintenance and supervision that ensure that only qualified persons monitor and supervise the system, they shall be permitted to be designed and installed in accordance with appropriate engineering practice. If required by the authority having jurisdiction, design documentation shall be provided.

The requirements of [Part V](#) are conditional, just like the requirements in [110.26](#); that is, some of the requirements are applicable only where the equipment “is likely to require examination, adjustment, servicing, or maintenance while energized.”

110.71 Strength. Manholes, vaults, and their means of access shall be designed under qualified engineering supervision and shall withstand all loads likely to be imposed on the structures.

Informational Note: See ANSI C2-2007, *National Electrical Safety Code*, for additional information on the loading that can be expected to bear on underground enclosures.

110.72 Cabling Work Space. A clear work space not less than 900 mm (3 ft) wide shall be provided where cables are located on both sides, and not less than 750 mm (2½ ft) where cables are only on one side. The vertical headroom shall be not less than

1.8 m (6 ft) unless the opening is within 300 mm (1 ft), measured horizontally, of the adjacent interior side wall of the enclosure.

Exception: A manhole containing only one or more of the following shall be permitted to have one of the horizontal work space dimensions reduced to 600 mm (2 ft) where the other horizontal clear work space is increased so the sum of the two dimensions is not less than 1.8 m (6 ft):

- (1) Optical fiber cables as covered in [Article 770](#)
- (2) Power-limited fire alarm circuits supplied in accordance with [760.121](#)
- (3) Class 2 or Class 3 remote-control and signaling circuits, or both, supplied in accordance with [725.121](#)

110.73 Equipment Work Space. Where electrical equipment with live parts that is likely to require examination, adjustment, servicing, or maintenance while energized is installed in a manhole, vault, or other enclosure designed for personnel access, the work space and associated requirements in [110.26](#) shall be met for installations operating at 1000 volts or less. Where the installation is over 1000 volts, the work space and associated requirements in [110.34](#) shall be met. A manhole access cover that weighs over 45.4 kg (100 lb) shall be considered as meeting the requirements of [110.34\(C\)](#).

110.74 Conductor Installation. Conductors installed in manholes and other enclosures intended for personnel entry shall be cabled, racked up, or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance. The installation shall comply with [110.74\(A\)](#) or [110.74\(B\)](#), as applicable

(A) 1000 Volts, Nominal, or Less. Wire bending space for conductors operating at 1000 volts or less shall be provided in accordance with the requirements of [314.28](#).

(B) Over 1000 Volts, Nominal. Conductors operating at over 1000 volts shall be provided with bending space in accordance with [314.71\(A\)](#) and (B), as applicable.

Exception: Where [314.71\(B\)](#) applies, each row or column of ducts on one wall of the enclosure shall be calculated individually, and the single row or column that provides the maximum distance shall be used.

110.75 Access to Manholes.

(A) Dimensions. Rectangular access openings shall not be less than 650 mm × 550 mm (26 in. × 22 in.). Round access openings in a manhole shall be not less than 650 mm (26 in.) in diameter.

Exception: A manhole that has a fixed ladder that does not obstruct the opening or that contains only one or more of the following shall be permitted to reduce the minimum cover diameter to 600 mm (2 ft):

- (1) Optical fiber cables as covered in [Article 770](#)
- (2) Power-limited fire alarm circuits supplied in accordance with [760.121](#)

(3) *Class 2 or Class 3 remote-control and signaling circuits, or both, supplied in accordance with 725.121*

(B) Obstructions. Manhole openings shall be free of protrusions that could injure personnel or prevent ready egress.

(C) Location. Manhole openings for personnel shall be located where they are not directly above electrical equipment or conductors in the enclosure. Where this is not practicable, either a protective barrier or a fixed ladder shall be provided.

(D) Covers. Covers shall be over 45 kg (100 lb) or otherwise designed to require the use of tools to open. They shall be designed or restrained so they cannot fall into the manhole or protrude sufficiently to contact electrical conductors or equipment within the manhole.

(E) Marking. Manhole covers shall have an identifying mark or logo that prominently indicates their function, such as “electric.”

110.76 Access to Vaults and Tunnels.

(A) Location. Access openings for personnel shall be located where they are not directly above electrical equipment or conductors in the enclosure. Other openings shall be permitted over equipment to facilitate installation, maintenance, or replacement of equipment.

(B) Locks. In addition to compliance with the requirements of 110.34, if applicable, access openings for personnel shall be arranged such that a person on the inside can exit when the access door is locked from the outside, or in the case of normally locking by padlock, the locking arrangement shall be such that the padlock can be closed on the locking system to prevent locking from the outside.

110.77 Ventilation. Where manholes, tunnels, and vaults have communicating openings into enclosed areas used by the public, ventilation to open air shall be provided wherever practicable.

110.78 Guarding. Where conductors or equipment, or both, could be contacted by objects falling or being pushed through a ventilating grating, both conductors and live parts shall be protected in accordance with the requirements of 110.27(A)(2) or 110.31(B)(1), depending on the voltage.

110.79 Fixed Ladders. Fixed ladders shall be corrosion resistant.

200.1 Scope. This article provides requirements for the following:

- (1) Identification of terminals
- (2) Grounded conductors in premises wiring systems
- (3) Identification of grounded conductors

Informational Note: See [Article 100](#) for definitions of *Grounded Conductor*, *Equipment Grounding Conductor*, and *Grounding Electrode Conductor*.

The grounded conductor is often, but not always, the neutral conductor. A neutral conductor is one that is connected to the neutral point of an electrical system. Some electrical systems do not have a neutral conductor. For example, in a 3-phase, corner-grounded delta system, the intentionally grounded conductor is not a neutral conductor, because it is not connected to a system neutral point. Because the conductor is connected to the same grounding electrode system as the non-current-carrying metal parts of the electrical equipment, generally no potential difference exists between the grounded conductor and those grounded metal parts. However, unlike an equipment grounding conductor, the grounded conductor is a current-carrying circuit conductor. Whether it is referred to as the grounded conductor or as the neutral conductor, the white or gray marking on a circuit conductor indicates that it is intentionally connected to the earth.

Electric shock injuries and electrocutions have occurred as a result of working on the grounded conductor while the circuit is energized. Extreme caution must be exercised where the grounded (neutral) conductor is part of a multiwire branch circuit.

See also

[210.4\(B\)](#) for disconnecting means for multiwire branch circuits
[Article 250](#) for more on the use and installation of grounded conductors

200.2 General. Grounded conductors shall comply with [200.2\(A\)](#) and [\(B\)](#).

(A) Insulation. The grounded conductor, if insulated, shall have insulation that is (1) suitable, other than color, for any ungrounded conductor of the same circuit for systems of 1000 volts or less, or impedance grounded neutral systems of over 1000 volts, or (2) rated not less than 600 volts for solidly grounded neutral systems of over 1000 volts as described in [250.184\(A\)](#).

(B) Continuity. The continuity of a grounded conductor shall not depend on a connection to a metallic enclosure, raceway, or cable armor.

Informational Note: See [300.13\(B\)](#) for the continuity of grounded conductors used in multiwire branch circuits.

Grounded conductors are required to be connected to a terminal or busbar that is specifically intended and identified for connection of grounded or neutral conductors. Because grounded conductors are current carrying, connecting them to a separate equipment grounding terminal or bar (i.e., directly connected to a metal cabinet or enclosure) results in the enclosure becoming a neutral conductor between the equipment grounding terminal and the point of connection for the grounded conductor. Note that 300.13 does not permit the wiring terminals of a device, such as a receptacle, to be the means of maintaining the continuity of the grounded conductor in a multiwire branch circuit.

200.3 Connection to Grounded System. Premises wiring shall not be electrically connected to a supply system unless the latter contains, for any grounded conductor of the interior system, a corresponding conductor that is grounded. For the purpose of this section, *electrically connected* shall mean connected so as to be capable of carrying current, as distinguished from connection through electromagnetic induction.

Exception: Listed utility-interactive inverters identified for use in distributed resource generation systems such as photovoltaic and fuel cell power systems shall be permitted to be connected to premises wiring without a grounded conductor where the connected premises wiring or utility system includes a grounded conductor.

Grounded conductors of premises wiring are required to be connected to the supply system (i.e., service or applicable separately derived system) grounded conductor to ensure a common, continuous, grounded system. It is not necessary to run a grounded circuit conductor in a feeder or branch circuit of an ungrounded system.

200.4 Neutral Conductors. Neutral conductors shall be installed in accordance with 200.4(A) and (B).

Specific requirements in 215.4 and 225.7 permit multiple circuits to have a common or shared neutral conductor. A neutral conductor is not required to be installed with the ungrounded circuit conductors if line-to-neutral loads are not supplied by the branch circuit or feeder. However, each multiwire circuit must have its own neutral conductor.

The concern with multiple circuits sharing a neutral conductor is the possibility of overloading the neutral conductor. Typically, an overcurrent protective device is not present, nor is it required to be installed in series with the neutral conductor. Therefore, an overload condition can exist without being detected or responded to, and insulation damage can occur. Because of the electrical relationship between the ungrounded conductors and the neutral conductor in multiwire single-phase and 3-phase circuits, the possibility of overload does not exist except where the load characteristics result in additive harmonic currents in the neutral conductor.

(A) Installation. Neutral conductors shall not be used for more than one branch circuit, for more than one multiwire branch circuit, or for more than one set of ungrounded feeder conductors unless specifically permitted elsewhere in this Code.

(B) Multiple Circuits. Where more than one neutral conductor associated with different circuits is in an enclosure, grounded

circuit conductors of each circuit shall be identified or grouped to correspond with the ungrounded circuit conductor(s) by wire markers, cable ties, or similar means in at least one location within the enclosure.

Exception No. 1: The requirement for grouping or identifying shall not apply if the branch-circuit or feeder conductors enter from a cable or a raceway unique to the circuit that makes the grouping obvious.

Exception No. 2: The requirement for grouping or identifying shall not apply where branch-circuit conductors pass through a box or conduit body without a loop as described in 314.16(B)(1) or without a splice or termination.

Where multiple circuits enter an enclosure, each circuit is required to have all of its conductors grouped together in at least one location to make it obvious which conductors are associated with the circuit. This grouping is not necessary if the conductors enter the enclosure as a single cable.

200.6 Means of Identifying Grounded Conductors.

(A) Sizes 6 AWG or Smaller. An insulated grounded conductor of 6 AWG or smaller shall be identified by one of the following means:

- (1) A continuous white outer finish.
- (2) A continuous gray outer finish.
- (3) Three continuous white or gray stripes along the conductor's entire length on other than green insulation.
- (4) Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section.
- (5) The grounded conductor of a mineral-insulated, metal-sheathed cable (Type MI) shall be identified at the time of installation by distinctive marking at its terminations.
- (6) A single-conductor, sunlight-resistant, outdoor-rated cable used as a grounded conductor in photovoltaic power systems, as permitted by 690.31, shall be identified at the time of installation by distinctive white marking at all terminations.
- (7) Fixture wire shall comply with the requirements for grounded conductor identification as specified in 402.8.
- (8) For aerial cable, the identification shall be as above, or by means of a ridge located on the exterior of the cable so as to identify it.

Using three white or gray stripes for identification is permitted for all conductor sizes. This method is the one most typically employed by a wire or cable manufacturer.

For 6 AWG or smaller, identification of the grounded conductor solely through the use of white or gray marking tape or other distinctive white or gray marking applied at the time of installation is not permitted, except as described for flexible cords and multiconductor cables in 200.6(C) and (E), Exception No. 1.

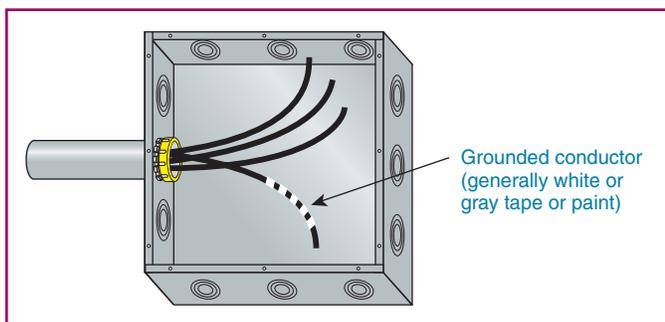

EXHIBIT 200.1 Field-applied identification of a 4 AWG conductor to identify it as the grounded conductor.

(B) Sizes 4 AWG or Larger. An insulated grounded conductor 4 AWG or larger shall be identified by one of the following means:

- (1) A continuous white outer finish.
- (2) A continuous gray outer finish.
- (3) Three continuous white or gray stripes along the conductor's entire length on other than green insulation.
- (4) At the time of installation, by a distinctive white or gray marking at its terminations. This marking shall encircle the conductor or insulation.

The most common method used to identify a single conductor as a grounded conductor is a white or gray marking to the insulation at all termination points at the time of installation. This field-applied white or gray marking must completely encircle the conductor insulation so that it is clearly visible. This marking can be applied by using tape or by painting the insulation. See [Exhibit 200.1](#).

(C) Flexible Cords An insulated conductor that is intended for use as a grounded conductor, where contained within a flexible cord, shall be identified by a white or gray outer finish or by methods permitted by [400.22](#).

(D) Grounded Conductors of Different Systems. Where grounded conductors of different systems are installed in the same raceway, cable, box, auxiliary gutter, or other type of enclosure, each grounded conductor shall be identified by system. Identification that distinguishes each system grounded conductor shall be permitted by one of the following means:

- (1) One system grounded conductor shall have an outer covering conforming to [200.6\(A\)](#) or (B).
- (2) The grounded conductor(s) of other systems shall have a different outer covering conforming to [200.6\(A\)](#) or [200.6\(B\)](#) or by an outer covering of white or gray with a readily distinguishable colored stripe other than green running along the insulation.
- (3) Other and different means of identification allowed by [200.6\(A\)](#) or (B) shall distinguish each system grounded conductor.

The means of identification shall be documented in a manner that is readily available or shall be permanently posted where the conductors of different systems originate.

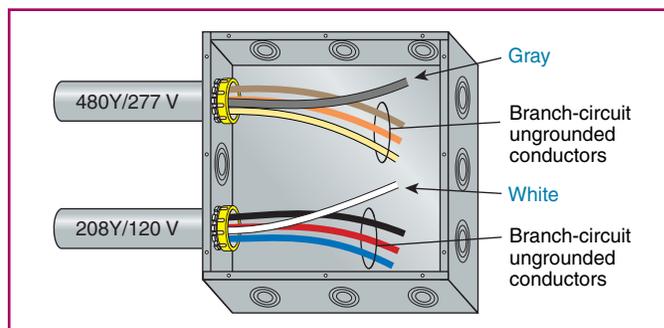

EXHIBIT 200.2 Grounded conductors of different systems in the same enclosure.

This requirement applies only where grounded conductors of different systems are installed in a common enclosure, such as a junction or pull box or a wireway. [Exhibit 200.2](#) illustrates an enclosure containing grounded conductors of two different systems that are distinguished from each other by color, which is one of the methods specified by [200.6\(D\)](#). Gray and white colored insulation on conductors is recognized by the *NEC* as two separate means of identifying grounded conductors. The industry practice of using white for lower-voltage systems and gray for higher-voltage systems is permitted but not mandated by the *NEC*.

Identifying the grounded conductors associated with one system from the grounded conductors of another system helps to ensure proper system connections. As more systems with grounded conductors are installed in a common enclosure, more means to distinguish each system grounded conductor from the other system grounded conductor in that enclosure become necessary. The only acceptable means of identifying grounded conductors are those specified in [200.6\(A\)](#) and (B).

The means of identification must be included in readily accessible documentation or be posted where the conductors originate. [Exhibit 200.3](#) is an example of a permanent label posted at electrical distribution equipment, indicating the identification scheme for the grounded conductors of each nominal voltage system.

EXHIBIT 200.3 A label on a piece of equipment containing conductors of two nominal voltage systems that provides the required identification of the two systems.

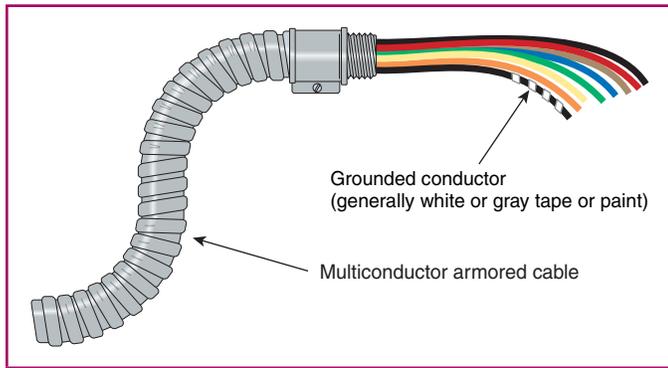

EXHIBIT 200.4 Field-applied identification to the grounded conductor of a multiconductor armored cable.

(E) Grounded Conductors of Multiconductor Cables. The insulated grounded conductors in a multiconductor cable shall be identified by a continuous white or gray outer finish or by three continuous white or gray stripes on other than green insulation along its entire length. Multiconductor flat cable 4 AWG or larger shall be permitted to employ an external ridge on the grounded conductor.

Exception No. 1: Where the conditions of maintenance and supervision ensure that only qualified persons service the installation, grounded conductors in multiconductor cables shall be permitted to be permanently identified at their terminations at the time of installation by a distinctive white marking or other equally effective means.

Exhibit 200.4 shows an example of a field-applied marking.

Exception No. 2: The grounded conductor of a multiconductor varnished-cloth-insulated cable shall be permitted to be identified at its terminations at the time of installation by a distinctive white marking or other equally effective means.

Informational Note: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

All shades of gray insulation and marking are reserved for grounded conductors. This Informational Note warns the user when working on existing systems because gray may identify ungrounded conductors in those systems.

200.7 Use of Insulation of a White or Gray Color or with Three Continuous White or Gray Stripes.

(A) General. The following shall be used only for the grounded circuit conductor, unless otherwise permitted in 200.7(B) and (C):

- (1) A conductor with continuous white or gray covering
- (2) A conductor with three continuous white or gray stripes on other than green insulation
- (3) A marking of white or gray color at the termination

(B) Circuits of Less Than 50 Volts. A conductor with white or gray color insulation or three continuous white stripes or having a marking of white or gray at the termination for circuits of less

than 50 volts shall be required to be grounded only as required by 250.20(A).

(C) Circuits of 50 Volts or More. The use of insulation that is white or gray or that has three continuous white or gray stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) and (2).

- (1) If part of a cable assembly that has the insulation permanently reidentified to indicate its use as an ungrounded conductor by marking tape, painting, or other effective means at its termination and at each location where the conductor is visible and accessible. Identification shall encircle the insulation and shall be a color other than white, gray, or green. If used for single-pole, 3-way or 4-way switch loops, the reidentified conductor with white or gray insulation or three continuous white or gray stripes shall be used only for the supply to the switch, but not as a return conductor from the switch to the outlet.
- (2) A flexible cord having one conductor identified by a white or gray outer finish or three continuous white or gray stripes, or by any other means permitted by 400.22, that is used for connecting an appliance or equipment permitted by 400.10. This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.

Informational Note: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

Re-identification and use of a white or gray insulated conductor as an ungrounded conductor could include water heaters, electric heat, motors, and switch loops. The insulation is re-identified to avoid confusing it with grounded conductors having white or gray insulation or neutral conductors at switch and outlet points and at other points in the wiring system where the conductors are accessible.

In previous editions, the *NEC* permitted switch loops using a white insulated conductor to serve as an ungrounded conductor supplying the switch but not as the return ungrounded conductor to supply the lighting outlet. Re-identification of a white conductor used for this purpose was not required. However, electronic switching devices with small power supplies are available that can be installed at switch locations. These devices require a grounded conductor in order to power the internal components. Although in switch loops the conductor with white or gray insulation is re-identified at all accessible locations to indicate that it is an ungrounded conductor, it is only permitted to supply the switch and cannot be the switched ungrounded conductor to the controlled outlet.

Exhibit 200.5 shows a switch location where the conductor with the white insulation is re-identified with red tape at the termination to indicate that it is the ungrounded supply conductor run to the switch.

200.9 Means of Identification of Terminals. The identification of terminals to which a grounded conductor is to be connected shall be substantially white in color. The identification of other terminals shall be of a readily distinguishable different color.

Exception: Where the conditions of maintenance and supervision ensure that only qualified persons service the installations,

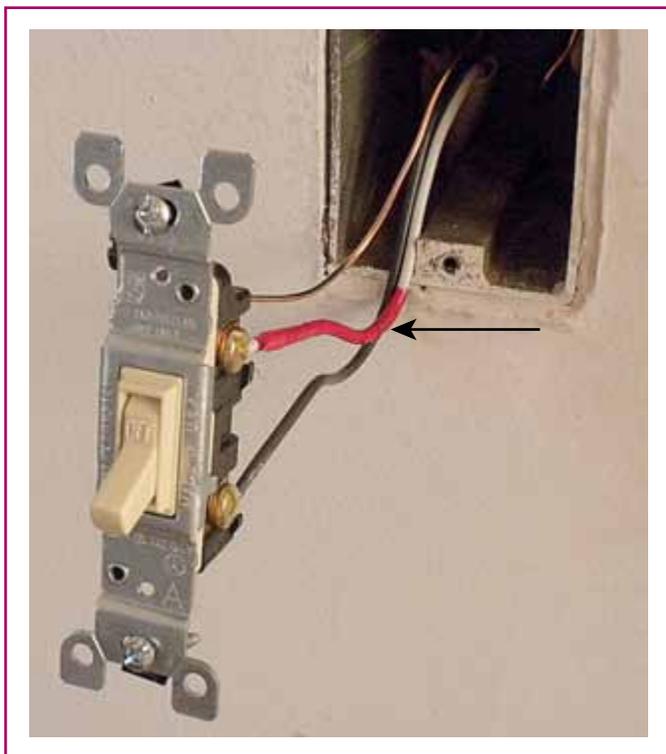

EXHIBIT 200.5 The re-identified conductor at a switch location, limited to use only as the ungrounded conductor that supplies the switch.

terminals for grounded conductors shall be permitted to be permanently identified at the time of installation by a distinctive white marking or other equally effective means.

Plating of all screws and terminals is commonly used to identify terminals, as well as to meet other requirements of specific applications, such as corrosion-resistant devices.

200.10 Identification of Terminals.

(A) Device Terminals. All devices, excluding panelboards, provided with terminals for the attachment of conductors and intended for connection to more than one side of the circuit shall have terminals properly marked for identification, unless the electrical connection of the terminal intended to be connected to the grounded conductor is clearly evident.

Exception: Terminal identification shall not be required for devices that have a normal current rating of over 30 amperes, other than polarized attachment plugs and polarized receptacles for attachment plugs as required in 200.10(B).

(B) Receptacles, Plugs, and Connectors. Receptacles, polarized attachment plugs, and cord connectors for plugs and polarized plugs shall have the terminal intended for connection to the grounded conductor identified as follows:

- (1) Identification shall be by a metal or metal coating that is substantially white in color or by the word *white* or the letter *W* located adjacent to the identified terminal.

- (2) If the terminal is not visible, the conductor entrance hole for the connection shall be colored white or marked with the word *white* or the letter *W*.

Informational Note: See 250.126 for identification of wiring device equipment grounding conductor terminals.

(C) Screw Shells. For devices with screw shells, the terminal for the grounded conductor shall be the one connected to the screw shell.

(D) Screw Shell Devices with Leads. For screw shell devices with attached leads, the conductor attached to the screw shell shall have a white or gray finish. The outer finish of the other conductor shall be of a solid color that will not be confused with the white or gray finish used to identify the grounded conductor.

Informational Note: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

(E) Appliances. Appliances that have a single-pole switch or a single-pole overcurrent device in the line or any line-connected screw shell lampholders, and that are to be connected by (1) a permanent wiring method or (2) field-installed attachment plugs and cords with three or more wires (including the equipment grounding conductor), shall have means to identify the terminal for the grounded circuit conductor (if any).

200.11 Polarity of Connections. No grounded conductor shall be attached to any terminal or lead so as to reverse the designated polarity.

Switchboards and panelboards		408.52

210.4 Multiwire Branch Circuits.

(A) General. Branch circuits recognized by this article shall be permitted as multiwire circuits. A multiwire circuit shall be permitted to be considered as multiple circuits. All conductors of a multiwire branch circuit shall originate from the same panelboard or similar distribution equipment.

A multiwire branch circuit used as multiple circuits satisfies the requirement for providing two small appliance branch circuits for countertop receptacle outlets in a dwelling unit kitchen.

Informational Note No. 1: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic currents on the neutral conductor.

Informational Note No. 2: See 300.13(B) for continuity of grounded conductors on multiwire circuits.

Power supplies for equipment such as computers, printers, and adjustable-speed motor drives can introduce harmonic currents in the system neutral conductor. The resulting total harmonic distortion current could exceed the load current of the device itself.

See also

310.15(B)(5) commentary for information on neutral conductor ampacity

(B) Disconnecting Means. Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates.

Informational Note See 240.15(B) for information on the use of single-pole circuit breakers as the disconnecting means

A simultaneous disconnecting means reduces the risk of shock to personnel working on equipment supplied by the multiwire branch circuit. In former editions of the *NEC*[®], this requirement applied only where the multiwire branch circuit supplied equipment mounted to a common yoke or strap.

For a single-phase installation, the disconnecting means could be two single-pole circuit breakers with an identified handle tie or a 2-pole circuit breaker, as shown in Exhibit 210.1 (top), or by a 2-pole switch, as shown in Exhibit 210.1 (bottom). For a 3-phase installation, a 3-pole circuit breaker, three single-pole circuit breakers with an identified handle tie, or a 3-pole switch provides the required simultaneous opening of the ungrounded conductors.

(C) Line-to-Neutral Loads. Multiwire branch circuits shall supply only line-to-neutral loads.

Exception No. 1: A multiwire branch circuit that supplies only one utilization equipment.

Exception No. 2: Where all ungrounded conductors of the multiwire branch circuit are opened simultaneously by the branch-circuit overcurrent device.

A multiwire branch circuit is a branch circuit that consists of two or more ungrounded conductors that have a voltage between them, and a

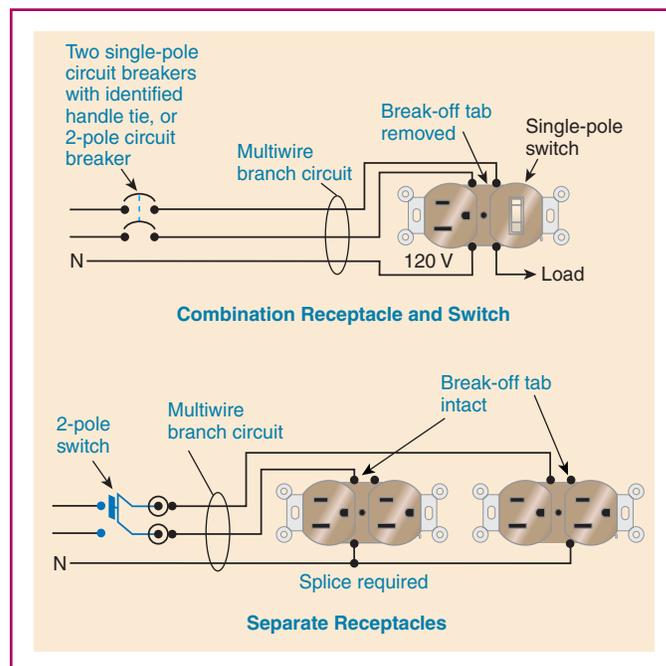

EXHIBIT 210.1 Two examples of situations where 210.4(B) requires the simultaneous disconnection of all ungrounded conductors to multiwire branch circuits supplying more than one device or equipment.

grounded conductor that has equal voltage between it and each ungrounded conductor of the circuit and that is connected to the neutral or grounded conductor of the system. The most commonly used multiwire branch circuit consists of two ungrounded conductors and one grounded conductor supplied from a 120/240-volt, single-phase, 3-wire system. Such multiwire circuits supply appliances that have both line-to-line and line-to-neutral connected loads, such as electric ranges and clothes dryers, or supply loads that are line-to-neutral connected only, such as the split-wired combination device shown in Exhibit 210.1 (bottom). A multiwire branch circuit is also permitted to supply a device with a 250-volt receptacle (line-to-line) and a 125-volt receptacle (line-to-neutral), as shown in Exhibit 210.2, provided the branch-circuit overcurrent device simultaneously opens both of the ungrounded conductors.

Multiwire branch circuits have many advantages, including using three wires to do the work of four (in place of two 2-wire circuits), less raceway fill, easier balancing and phasing of a system, and less voltage drop. Multiwire branch circuits may be derived from a 120/240-volt, single-phase; a 208Y/120-volt and 480Y/277-volt, 3-phase, 4-wire; or a

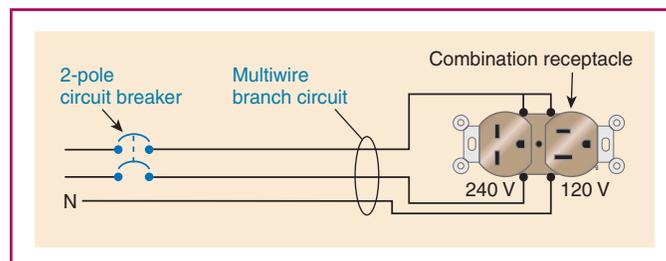

EXHIBIT 210.2 A multiwire branch circuit supplying line-to-neutral and line-to-line connected loads, provided the ungrounded conductors can be opened simultaneously by the branch-circuit overcurrent device.

240/120-volt, 3-phase, 4-wire delta system. If two ungrounded conductors and a common neutral of a multiwire branch circuit are supplied from a 208Y/120-volt, 3-phase, 4-wire system, the neutral carries the same current as the phase conductor with the highest current and, therefore, should be the same size.

If loads are connected line-to-line (i.e., utilization equipment connected between 2 or 3 phases), 2-pole or 3-pole circuit breakers are required to disconnect all ungrounded conductors simultaneously. Use of single pole circuit breakers with handle ties for 240-volt equipment may not open all ungrounded conductors.

210.19(A) and its commentary for more information on voltage drop for branch circuits

210.4(A) and its commentary for more information on 3-phase, 4-wire system neutral conductors

240.15(B)(1) for more information on circuit breaker overcurrent protection of ungrounded conductors on multiwire branch circuits

300.13(B) and its commentary for hazards associated with device removal on multiwire branch circuits

(D) Grouping. The ungrounded and grounded circuit conductors of each multiwire branch circuit shall be grouped in accordance with **200.4(B)**.

210.5 Identification for Branch Circuits.

(A) Grounded Conductor. The grounded conductor of a branch circuit shall be identified in accordance with **200.6**.

(B) Equipment Grounding Conductor. The equipment grounding conductor shall be identified in accordance with **250.119**.

(C) Identification of Ungrounded Conductors. Ungrounded conductors shall be identified in accordance with **210.5(C)(1)** or (2), as applicable.

(1) Branch Circuits Supplied from More Than One Nominal Voltage System. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit shall be identified by phase or line and system at all termination, connection, and splice points in compliance with **210.5(C)(1)(a)** and (b).

The requirement for the identification of ungrounded branch-circuit conductors covers all branch-circuit configurations. The identification requirement applies only where more than one nominal voltage system supplies branch circuits (e.g., a 208Y/120-volt system and a 480Y/277-volt system) and requires that the conductors be identified by system and phase. Unlike the requirement of **200.6(D)** for identifying the grounded conductors supplied from different voltage systems, application of this requirement is not predicated on the different system conductors sharing a common raceway, cabinet, or enclosure.

(a) *Means of Identification.* The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means.

(b) *Posting of Identification Means.* The method utilized for conductors originating within each branch-circuit panelboard or similar branch-circuit distribution equipment shall be

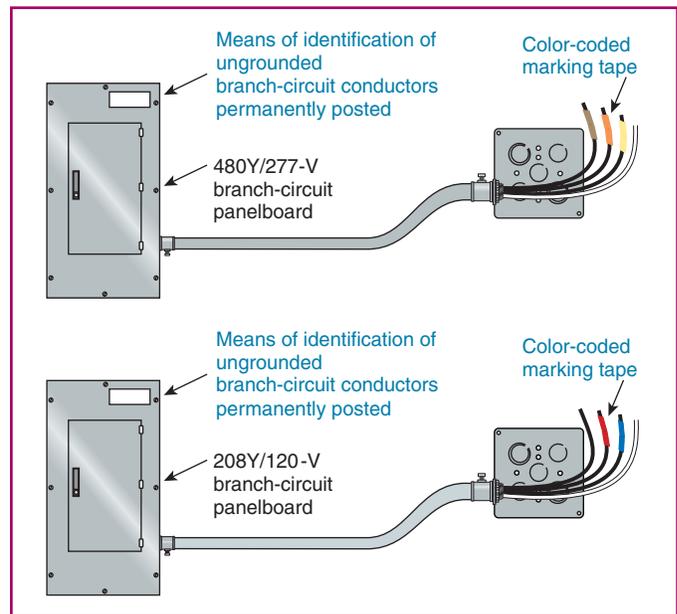

EXHIBIT 210.3 Examples of accessible (ungrounded) phase conductors identified by marking tape at a junction or outlet location where the conductors will be spliced or terminated.

documented in a manner that is readily available or shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment. The label shall be of sufficient durability to withstand the environment involved and shall not be handwritten.

Although color coding is a popular method, other types of marking or tagging are acceptable alternatives. Whatever identification method is used, it must be consistent throughout the premises. If the identification legend is posted at electrical distribution equipment, the marking only has to describe the identification scheme for the ungrounded conductors supplied from that particular equipment. This affords a higher level of safety for personnel working on premises electrical systems having ungrounded conductors supplied from multiple nominal voltage systems.

Exhibit 210.3 shows an example of two different nominal voltage systems in a building. Each ungrounded system conductor is identified by color-coded marking tape. A label indicating the means of the identification is permanently located at each panelboard. Although there are commonly employed color schemes, the NEC contains few specific color designations for ungrounded conductors, such as for heating cables, intrinsically safe circuits, isolated systems in health care facilities, or a 4-wire delta service.

See also

210.5(C)(2) and its commentary for identification of dc systems

Exception: In existing installations where a voltage system(s) already exists and a different voltage system is being added, it shall be permissible to mark only the new system voltage. Existing unidentified systems shall not be required to be identified at each termination, connection, and splice point in compliance with **210.5(C)(1)(a)** and (b). Labeling shall be required at each voltage system distribution equipment to identify that only one voltage system has been marked for a new system(s). The new

system label(s) shall include the words “other unidentified systems exist on the premises.”

Systems installed prior to the adoption of the 2005 NEC were not required to be identified. The NEC is not retroactive, so only new installations would require identification. However, if existing installations are not marked, this section requires the new installation to be marked to warn that there are unidentified systems.

(2) Branch Circuits Supplied from Direct-Current Systems.

Where a branch circuit is supplied from a dc system operating at more than 60 volts, each ungrounded conductor of 4 AWG or larger shall be identified by polarity at all termination, connection, and splice points by marking tape, tagging, or other approved means; each ungrounded conductor of 6 AWG or smaller shall be identified by polarity at all termination, connection, and splice points in compliance with 210.5(C)(2)(a) and (b). The identification methods utilized for conductors originating within each branch-circuit panelboard or similar branch-circuit distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.

(a) *Positive Polarity, Sizes 6 AWG or Smaller.* Where the positive polarity of a dc system does not serve as the connection point for the grounded conductor, each positive ungrounded conductor shall be identified by one of the following means:

- (1) A continuous red outer finish
- (2) A continuous red stripe durably marked along the conductor's entire length on insulation of a color other than green, white, gray, or black
- (3) Imprinted plus signs (+) or the word POSITIVE or POS durably marked on insulation of a color other than green, white, gray, or black and repeated at intervals not exceeding 610 mm (24 in.) in accordance with 310.120(B)
- (4) An approved permanent marking means such as sleeving or shrink-tubing that is suitable for the conductor size, at all termination, connection, and splice points, with imprinted plus signs (+) or the word POSITIVE or POS durably marked on insulation of a color other than green, white, gray, or black

(b) *Negative Polarity, Sizes 6 AWG or Smaller.* Where the negative polarity of a dc system does not serve as the connection point for the grounded conductor, each negative ungrounded conductor shall be identified by one of the following means:

- (1) A continuous black outer finish
- (2) A continuous black stripe durably marked along the conductor's entire length on insulation of a color other than green, white, gray, or red
- (3) Imprinted minus signs (–) or the word NEGATIVE or NEG durably marked on insulation of a color other than green, white, gray, or red and repeated at intervals not exceeding 610 mm (24 in.) in accordance with 310.120(B)

- (4) An approved permanent marking means such as sleeving or shrink-tubing that is suitable for the conductor size, at all termination, connection, and splice points, with imprinted minus signs (–) or the word NEGATIVE or NEG durably marked on insulation of a color other than green, white, gray, or red

The requirements for the identification of ungrounded conductors are based on whether the system is negatively or positively grounded. Negatively grounded and positively grounded 2-wire dc systems must employ a grounded conductor identified in accordance with 200.6. Grounded conductors of negatively grounded and positively grounded 2-wire dc systems are also required to be identifiable and distinguishable from ungrounded conductors of 3-wire dc systems and of 2-wire dc systems employing high-impedance references to ground. The identification method must be documented so that it is readily available, or it must be posted at each branch-circuit panelboard or branch-circuit distribution equipment.

210.6 Branch-Circuit Voltage Limitations. The nominal voltage of branch circuits shall not exceed the values permitted by 210.6(A) through (E).

(A) Occupancy Limitation. In dwelling units and guest rooms or guest suites of hotels, motels, and similar occupancies, the voltage shall not exceed 120 volts, nominal, between conductors that supply the terminals of the following:

- (1) Luminaires
- (2) Cord-and-plug-connected loads 1440 volt-amperes, nominal, or less or less than ¼ hp

The term *similar occupancies* in 210.6(A) refers to sleeping rooms in dormitories, fraternities, sororities, nursing homes, and other such facilities. This requirement is intended to reduce the exposure of residents in these types of occupancies to electric shock hazards when using or servicing permanently installed luminaires and cord-and-plug-connected portable lamps and appliances.

Small loads, such as those of 1440 volt-amperes or less and motors of less than ¼ horsepower, are limited to 120-volt circuits. High-wattage cord-and-plug-connected loads, such as electric ranges, clothes dryers, and some window air conditioners, could be connected to a 208-volt or 240-volt circuit.

(B) 120 Volts Between Conductors. Circuits not exceeding 120 volts, nominal, between conductors shall be permitted to supply the following:

- (1) The terminals of lampholders applied within their voltage ratings
- (2) Auxiliary equipment of electric-discharge lamps

Informational Note: See 410.137 for auxiliary equipment limitations.

Auxiliary equipment includes ballasts and starting devices for fluorescent and high-intensity-discharge (e.g., mercury vapor, metal halide, and sodium) lamps.

- (3) Cord-and-plug-connected or permanently connected utilization equipment

(C) 277 Volts to Ground. Circuits exceeding 120 volts, nominal, between conductors and not exceeding 277 volts, nominal, to ground shall be permitted to supply the following:

- (1) Listed electric-discharge or listed light-emitting diode-type luminaires
- (2) Listed incandescent luminaires, where supplied at 120 volts or less from the output of a stepdown autotransformer that is an integral component of the luminaire and the outer shell terminal is electrically connected to a grounded conductor of the branch circuit

An incandescent luminaire is permitted on a 277-volt circuit only if it is a listed luminaire with an integral autotransformer and an output to the lampholder that does not exceed 120 volts. In this application, the autotransformer supplies 120 volts to the lampholder, and the grounded conductor is connected to the screw shell of the lampholder. This application is similar to a branch circuit derived from an autotransformer, except that the 120-volt circuit is the internal wiring of the luminaire.

- (3) Luminaires equipped with mogul-base screw shell lampholders
- (4) Lampholders, other than the screw shell type, applied within their voltage ratings
- (5) Auxiliary equipment of electric-discharge lamps

Informational Note: See 410.137 for auxiliary equipment limitations.

- (6) Cord-and-plug-connected or permanently connected utilization equipment

Exhibit 210.4 shows some examples of luminaires permitted to be connected to branch circuits. Medium-base screw shell lampholders must not be directly connected to 277-volt branch circuits. Other types of lampholders may be connected to 277-volt circuits but only if the lampholders have a 277-volt rating. A 277-volt branch circuit may be connected to a listed electric-discharge luminaire or to a listed autotransformer-type incandescent luminaire with a medium-base screw shell lampholder.

Typical examples of cord-and-plug-connected equipment include through-the-wall heating and air-conditioning units and restaurant

deep fat fryers that operate at 480 volts, 3 phase, from a grounded wye system.

Section 210.6(D) describes the voltage as “volts, nominal, to ground,” whereas 210.6(A), (B), (C), and (E) describe voltage as “volts, nominal, between conductors.” Luminaires listed for and connected to a 480-volt source may be used in applications permitted by 210.6(C), provided the 480-volt system is in fact a grounded wye system that contains a grounded conductor (thus limiting the system “voltage to ground” to the 277-volt level).

(D) 600 Volts Between Conductors. Circuits exceeding 277 volts, nominal, to ground and not exceeding 600 volts, nominal, between conductors shall be permitted to supply the following:

- (1) The auxiliary equipment of electric-discharge lamps mounted in permanently installed luminaires where the luminaires are mounted in accordance with one of the following:
 - a. Not less than a height of 6.7 m (22 ft) on poles or similar structures for the illumination of outdoor areas such as highways, roads, bridges, athletic fields, or parking lots
 - b. Not less than a height of 5.5 m (18 ft) on other structures such as tunnels

Informational Note: See 410.137 for auxiliary equipment limitations.

Exhibit 210.5 (left) shows the minimum mounting height of 18 feet for luminaires installed in tunnels and similar structures. Exhibit 210.5 (right) illustrates the minimum mounting height of 22 feet for luminaires in outdoor areas such as parking lots.

- (2) Cord and-plug-connected or permanently connected utilization equipment other than luminaires
- (3) Luminaires powered from direct-current systems where either of the following apply:
 - a. The luminaire contains a listed, dc-rated ballast that provides isolation between the dc power source and the lamp circuit and protection from electric shock when changing lamps.

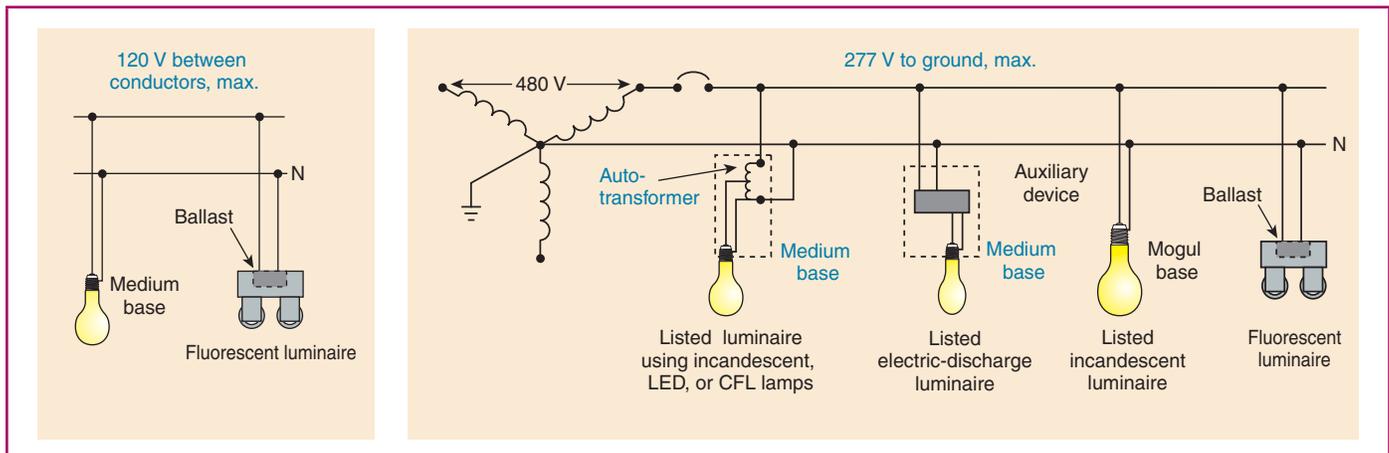

EXHIBIT 210.4 Examples of luminaires permitted to be connected to branch circuits.

EXHIBIT 210.5 Minimum mounting heights for tunnel and parking lot lighting for circuits exceeding 277 volts to ground and not exceeding 600 volts between conductors supplying auxiliary equipment of electric-discharge lampholders. (Left: © Anese/Dreamstime.com)

- b. The luminaire contains a listed, dc-rated ballast and has no provision for changing lamps.

Exception No. 1 to (B), (C), and (D): For lampholders of infrared industrial heating appliances as provided in 425.14.

Exception No. 2 to (B), (C), and (D): For railway properties as described in 110.19.

(E) Over 600 Volts Between Conductors. Circuits exceeding 600 volts, nominal, between conductors shall be permitted to supply utilization equipment in installations where conditions of maintenance and supervision ensure that only qualified persons service the installation.

210.7 Multiple Branch Circuits. Where two or more branch circuits supply devices or equipment on the same yoke or mounting strap, a means to simultaneously disconnect the ungrounded supply conductors shall be provided at the point at which the branch circuits originate.

210.8 Ground-Fault Circuit-Interrupter Protection for Personnel. Ground-fault circuit-interrupter protection for personnel shall be provided as required in 210.8(A) through (E). The ground-fault circuit interrupter shall be installed in a readily accessible location.

Informational Note No. 1: See 215.9 for ground-fault circuit-interrupter protection for personnel on feeders.

Informational Note No. 2: See 422.5(A) for GFCI requirements for appliances.

For the purposes of this section, when determining distance from receptacles the distance shall be measured as the shortest path the cord of an appliance connected to the receptacle would

follow without piercing a floor, wall, ceiling, or fixed barrier, or passing through a door, doorway, or window.

The Consumer Product Safety Commission (CPSC) has reported a decrease in the number of electrocutions in the United States since the introduction of ground-fault circuit-interrupter (GFCI) devices in the 1971 NEC. Most safety experts agree that GFCIs are directly responsible for saving numerous lives and preventing countless injuries.

Exhibit 210.6 shows a typical circuit arrangement of a GFCI. The line conductors are passed through a sensor and are connected to a shunt-trip device. As long as the current in the conductors is equal, the device remains in a closed position. If one of the conductors comes in contact with a grounded object, either directly or through a person's body, some of the current returns by the alternative path, resulting in an unbalanced current. The toroidal coil senses the unbalanced current, and the shunt-trip mechanism reacts to open the circuit. The circuit design does not

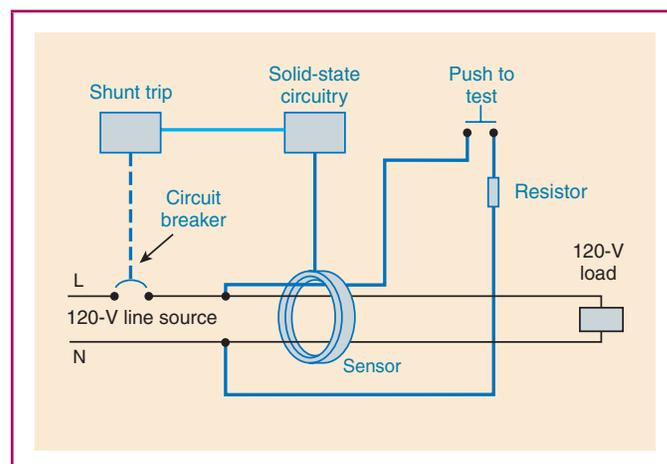

EXHIBIT 210.6 The circuitry and components of a typical GFCI.

EXHIBIT 210.7 A GFCI circuit breaker, which protects all outlets supplied by the branch circuit. (Courtesy of Siemens)

require the presence of an equipment grounding conductor, which is the reason 406.4(D)(2)(c) permits the use of GFCIs as replacements for receptacles where a grounding means does not exist.

A variety of GFCIs are available, including portable and plug-in types and circuit-breaker types, types built into attachment plug caps, and receptacle types. Each type has a test switch so that units can be checked periodically to ensure proper operation. See Exhibits 210.7 and 210.8.

The manufacturer's installation and use instructions specify monthly testing. To facilitate this important ongoing safety check, GFCIs installed to protect the receptacles covered in 210.8(A) and (B) are required to be readily accessible.

EXHIBIT 210.8 A 15-ampere duplex receptacle with integral GFCI that also protects downstream loads.

GFCIs operate on fault currents of 4 to 6 milliamperes. At trip levels of 5 milliamperes (the instantaneous current could be much higher), a shock can be felt during the fault. The shock can lead to an involuntary reaction that may cause a secondary accident such as a fall. GFCIs do not protect persons from shock hazards where contact is between phase and neutral or between phase-to-phase conductors.

Although 210.8 is the main rule for GFCIs, other specific applications that require the use of GFCIs are listed in Commentary Table 210.1.

COMMENTARY TABLE 210.1 Additional Requirements for the Application of GFCI Protection

Location	Applicable Section(s)
Aircraft hangars	513.12
Audio system equipment	640.10(A)
Boathouses	555.19(B)(1)
Carnivals, circuses, fairs, and similar events	525.23(A)
Commercial garages	511.12
Drinking fountains	422.52(A)
Electrically operated pool covers	680.27(B)(2)
Electronic equipment, sensitive	647.7(A)
Elevators, escalators, and moving walkways	620.85
Feeders	215.9
Fountains	680.51(A), 680.56(A)
Health care facilities	517.21
High-pressure spray washers	422.5(A)
Hydromassage bathtubs	680.71
Marinas and boatyards	555.19(B)(1)
Mobile and manufactured homes	550.13(B), 550.13(E), 550.32(E)
Natural and artificially made bodies of water	682.15
Park trailers	552.41(C), 552.41(D)
Pools permanently installed	680.22(A)(2), 680.22(A)(4), 680.22(B)(3), 680.22(B)(4), 680.23(A)(3)
Pools, storable	680.32
Sensitive electronic equipment	647.7(A)
Space heating embedded in floor	424.44(E)
Spas and hot tubs	680.44
Signs within fountains	680.57(B)
Signs, portable or mobile	600.10(C)(2)
Recreational vehicles	551.40(C), 551.41(C)
Recreational vehicle parks	551.71(F)
Replacement receptacles	406.4(D)(3)
Temporary installations	590.6
Tubs, therapeutic	680.62(A)

(A) Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in 210.8(A)(1) through (10) shall have ground-fault circuit-interrupter protection for personnel.

(1) Bathrooms

All 125-volt, single-phase, 15- and 20-ampere receptacles in bathrooms must have GFCI protection, including receptacles that are integral with luminaires. There are no exceptions to the bathroom GFCI requirement.

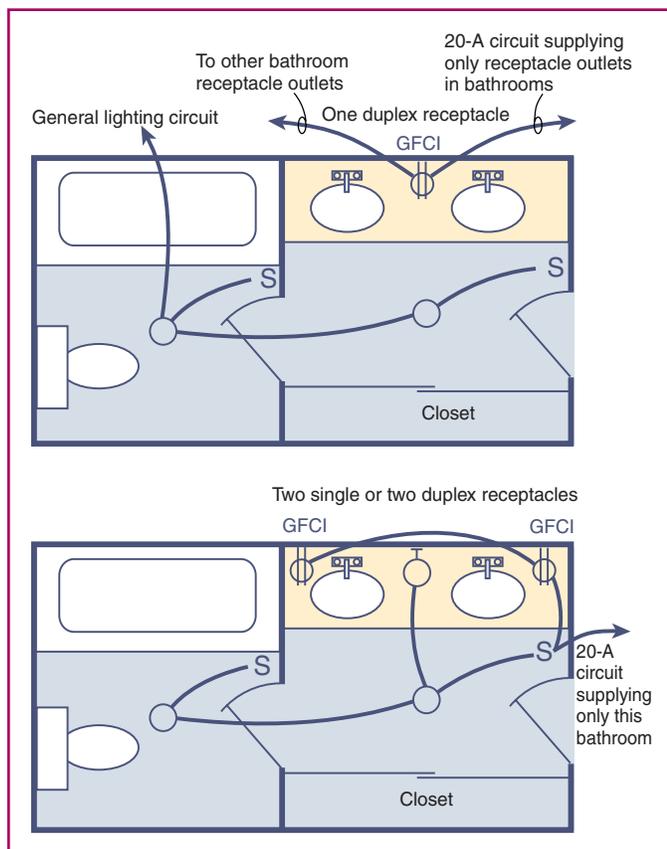

EXHIBIT 210.9 GFCI-protected receptacles in bathrooms.

The term *bathroom* (see Article 100) applies to the entire area, whether or not a separating door, as illustrated in Exhibit 210.9, is present. If the basins are adjacent and in close proximity, one receptacle outlet, meeting the proximity requirement of 210.52(D) for each basin, can be used to meet the receptacle outlet location requirement as shown in Exhibit 210.9 (top). Exhibit 210.9 also illustrates the requirements of 210.11(C)(3), which provides two acceptable supply circuit arrangements for the bathroom receptacle outlet(s).

- (2) Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use

The requirement for GFCI receptacles in garages and sheds, as illustrated in Exhibit 210.10, improves safety for persons using portable handheld tools, string trimmers, snow blowers, and similar tools that might be connected to these receptacles. GFCI protection is also required because auto repair work and general workshop electrical tools are often used.

There are no exceptions. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in garages must provide GFCI protection for the user of appliances or other equipment regardless of where the receptacle is located in the garage. Appliance leakage currents permitted by today's product standards are far less than the operational threshold of a GFCI, so nuisance tripping is unlikely.

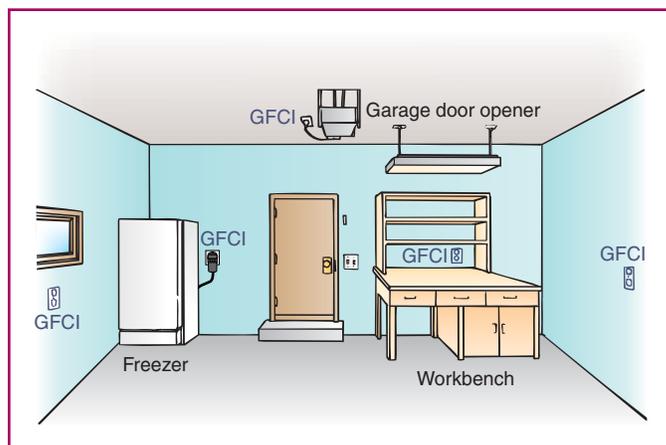

EXHIBIT 210.10 Examples of receptacles in a garage required to have GFCI protection.

- (3) Outdoors

Exception to (3): Receptacles that are not readily accessible and are supplied by a branch circuit dedicated to electric snow-melting, deicing, or pipeline and vessel heating equipment shall be permitted to be installed in accordance with 426.28 or 427.22, as applicable.

The dwelling unit shown in Exhibit 210.11, which has four outdoor receptacles, illustrates the requirement of 210.8(A)(3). Three receptacles must be provided with GFCI protection. The fourth receptacle, located adjacent to the gutter for the roof-mounted snow-melting cable, is not readily accessible and, therefore, is exempt from the GFCI requirements because of its dedicated function to supply the deicing equipment. This receptacle is, however, covered by the equipment ground-fault protection requirements of 426.28.

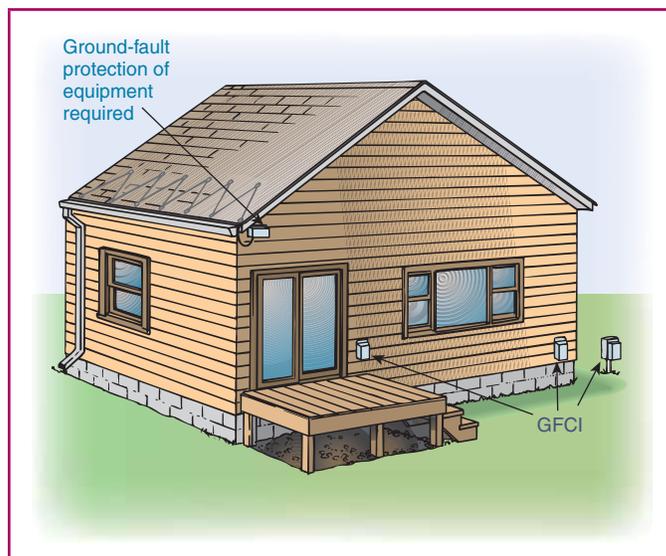

EXHIBIT 210.11 A dwelling unit with three outdoor receptacles that are required to have GFCI protection. It also has one outdoor receptacle that supplies rooftop snow melting equipment, which is protected by ground-fault protection of equipment (GFPE).

See also

210.52(E) and **406.9(B)(1)** commentary regarding the installation of outdoor receptacles in wet and damp locations

- (4) Crawl spaces — at or below grade level
- (5) Unfinished portions or areas of the basement not intended as habitable rooms

Exception to (5): A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.

Informational Note: See **760.41(B)** and **760.121(B)** for power supply requirements for fire alarm systems.

Receptacles installed under the exception to **210.8(A)(5)** shall not be considered as meeting the requirements of **210.52(G)**.

The receptacles in a work area of a basement, as shown in **Exhibit 210.12**, must have GFCI protection. This requirement does not apply to finished areas in basements, such as sleeping rooms or family rooms. The only exception to this requirement is for fire alarm and burglar systems. This correlates with the performance requirements covering fire alarm power supplies contained in *NFPA 72[®], National Fire Alarm and Signaling Code*.

- (6) Kitchens — where the receptacles are installed to serve the countertop surfaces

Many countertop kitchen appliances have only two-wire cords that do not have an equipment grounding conductor. The presence of water and grounded surfaces contributes to a hazardous environment, leading to the requirement for GFCI protection. See **Exhibit 210.13** and **Exhibit 210.28**. The requirement is intended for receptacles serving the countertop. However, **210.8(A)(7)** would apply to any other 15- or 20-ampere, 125-volt receptacles within 6 feet of a sink.

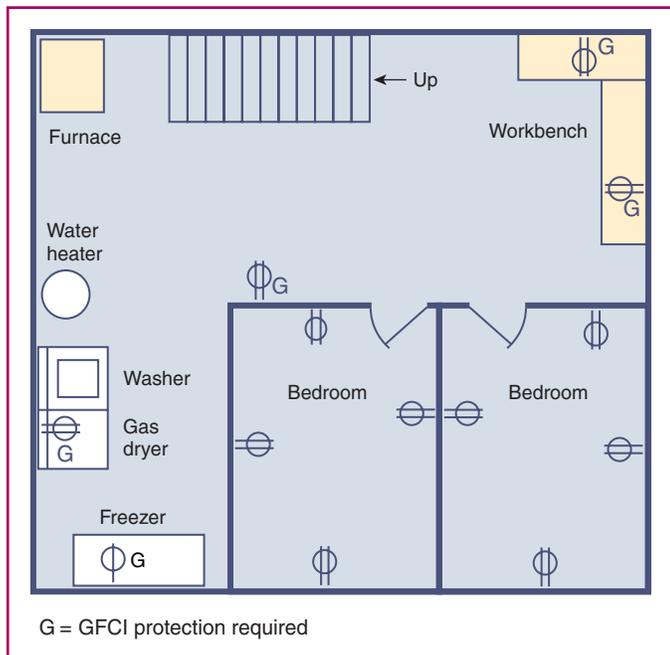

EXHIBIT 210.12 A basement floor plan with GFCI-protected receptacles in the work area and non-GFCI receptacles in the finished areas.

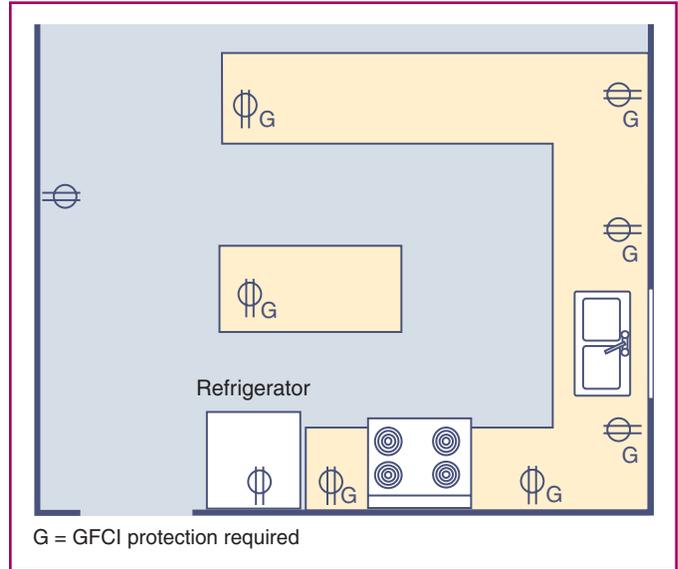

EXHIBIT 210.13 GFCI-protected receptacles serving countertop surfaces in dwelling unit kitchens.

Receptacles installed below the countertop for appliances such as trash compactors are not required to be protected by GFCIs if the receptacle is more than 6 feet from the inside edge of the top of the sink bowl. A receptacle(s) installed behind a refrigerator is installed to supply that appliance, not the countertop, and is not covered by this GFCI requirement if the receptacle is more than 6 feet from the outside edge of the sink. According to **406.5(E)**, receptacles installed to serve countertops cannot be installed in the countertop in the face-up position because liquid, dirt, and other foreign material can enter the receptacle.

- (7) Sinks — where receptacles are installed within 1.8 m (6 ft) from the top inside edge of the bowl of the sink

Sinks in kitchens are not the only sinks where a ground-fault shock hazard exists; therefore, this requirement covers all sinks in a dwelling. This GFCI requirement is not limited to receptacles serving countertop surfaces; rather, it covers all 125-volt, 15- and 20-ampere receptacles within 6 feet of any point along the inside edge of the top of the sink bowl. Many appliances used in these locations are ungrounded, and the presence of water and grounded surfaces contributes to a hazardous environment. As illustrated in **Exhibit 210.14**, any 125-volt, 15- or 20-ampere receptacle installed within 6 feet of a sink located in other than a kitchen is also required to be GFCI protected.

- (8) Boathouses
- (9) Bathtubs or shower stalls — where receptacles are installed within 1.8 m (6 ft) of the outside edge of the bathtub or shower stall
- (10) Laundry areas

In some instances, bathtubs and shower stalls are installed in areas that might not meet the *NEC* definition of a bathroom. Many of these areas may have tile or other conductive, and possibly grounded, floors. A shock hazard could be present.

GFCI protection of receptacles in laundry areas of dwelling units applies regardless of what the room is called. Wet clothes and puddles

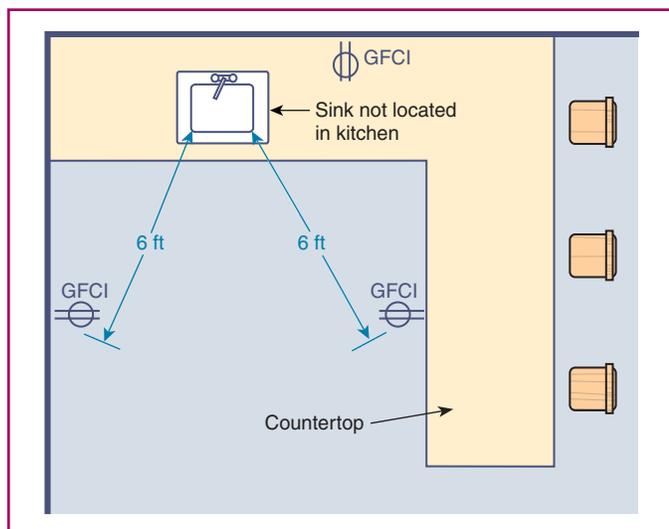

EXHIBIT 210.14 GFCI protection of receptacles located within 6 feet of a sink located in other than the kitchen.

of water can pose a shock hazard to anyone using any appliance in laundry areas.

(B) Other Than Dwelling Units. All single-phase receptacles rated 150 volts to ground or less, 50 amperes or less and three-phase receptacles rated 150 volts to ground or less, 100 amperes or less installed in the following locations shall have ground-fault circuit-interrupter protection for personnel.

This requirement now applies to most single phase receptacles in the areas listed in this section. This includes receptacles on 240-volt circuits. Three-phase receptacles on 280Y/120-volt three-phase circuits in those areas would also require GFCI protection. Equipment connected to receptacles of the higher voltage and current ratings present the same shock hazards as those of lower voltage and current ratings.

(1) Bathrooms

Some motel and hotel bathrooms, like the one shown in [Exhibit 210.15](#), have the basin located outside the door to the room containing the tub, toilet, or shower. The *NEC* definition of *bathroom* uses the word “area,” so that the sink shown in [Exhibit 210.15](#) is considered as being in the bathroom and is subject to the GFCI requirement. In [Exhibit 210.15](#), the supply circuit requirement of [210.11\(C\)\(3\)](#) for bathroom receptacle outlets is depicted.

(2) Kitchens

This requirement applies to single-phase and three-phase kitchen receptacles whether or not the receptacle serves countertop areas.

Electrical accident data indicate that there are many electrical hazards in nondwelling kitchens, including poorly maintained electrical equipment, damaged cords, and wet floors. Requiring GFCI protection in these kitchens protects personnel who might be exposed to electric shock. The *NEC* definition of *kitchen* is “an area with a sink and permanent facilities for food preparation and cooking.” A portable cooking appliance (e.g., cord-and-plug-connected microwave oven or hot plate)

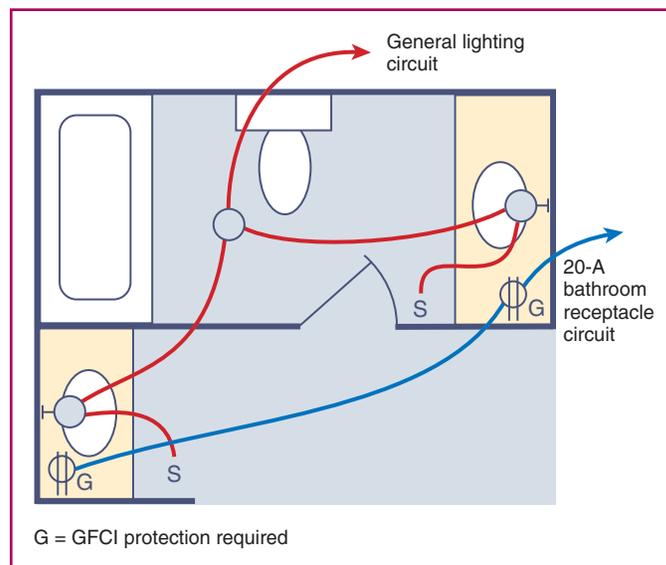

EXHIBIT 210.15 GFCI protection of receptacles in a motel/hotel bathroom where one basin is located outside the bathroom door.

does not constitute a permanent cooking facility. Kitchens in restaurants, hotels, schools, churches, dining halls, and similar facilities are covered by this requirement.

(3) Rooftops

Exception: Receptacles on rooftops shall not be required to be readily accessible other than from the rooftop.

See also

[210.63](#) for rooftops that also have heating, air-conditioning, and refrigeration equipment

(4) Outdoors

Exception No. 1 to (3) and (4): Receptacles that are not readily accessible and are supplied by a branch circuit dedicated to electric snow-melting, deicing, or pipeline and vessel heating equipment shall be permitted to be installed in accordance with [426.28](#) or [427.22](#), as applicable.

Exception No. 2 to (4): In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in [590.6\(B\)\(3\)](#) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power is interrupted or having a design that is not compatible with GFCI protection.

Although commercial, institutional, and industrial occupancies are not required to have outdoor receptacle outlets installed for general use, outdoor receptacle outlets may be installed to meet the requirement of [210.63](#) or at the discretion of the designer or owner. Except for the two limited exceptions [Exception No. 1 to (3) and (4) and Exception No. 2 to (4)], all outdoor single-phase and three-phase receptacles specified in this section that are installed at commercial, institutional, and industrial occupancies are required to be provided with GFCI protection.

EXHIBIT 210.16 GFCI protection required for single-phase, 125-volt, and 250-volt, 15-ampere duplex receptacles installed within 6 feet of a sink if the receptacles are rated 50 amperes or less.

- (5) Sinks — where receptacles are installed within 1.8 m (6 ft) from the top inside edge of the bowl of the sink

Exception No. 1 to (5): In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without GFCI protection.

Exception No. 2 to (5): For receptacles located in patient bed locations of general care (Category 2) or critical care (Category 1) spaces of health care facilities other than those covered under 210.8(B)(1), GFCI protection shall not be required.

This Item (5) covers receptacles installed near sinks in lunchrooms, janitors' closets, classrooms, and all other areas not covered by the bathroom and kitchen requirements. Exhibit 210.16 shows two single-phase, 125-volt, 15-ampere duplex receptacles installed within 6 feet of the top inside edge of the sink bowl that is covered by the GFCI requirement. The 240-volt receptacle to the right of the duplex receptacles is not also subject to the GFCI requirement.

- (6) Indoor wet locations
- (7) Locker rooms with associated showering facilities
- (8) Garages, service bays, and similar areas other than vehicle exhibition halls and showrooms

This requirement covers all garages, not just those in which vehicle maintenance is expected to take place. Many commercial garages have receptacles installed for purposes other than the use of hand tools. For instance, winter temperatures in some areas necessitate the use of engine block heaters. Cord-and-plug-connected engine block heaters may not be listed, and, therefore are not subject to the maximum leakage current requirements for appliances. If these receptacles are not GFCI protected, the frame of the vehicle can become energized, posing a shock hazard.

- (9) Crawl spaces — at or below grade level

- (10) Unfinished portions or areas of the basement not intended as habitable rooms

- (C) **Boat Hoists.** GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.

Documented cases of electrocutions associated with the use of boat hoists compiled by the U.S. Consumer Product Safety Commission substantiated the need for this requirement. The GFCI requirement applies only to dwelling unit locations and to boat hoists supplied by 15- or 20-ampere branch circuits rated 240 volts or less. It is important to note that it applies to all outlets, not just to receptacle outlets. Therefore, both cord-and-plug-connected and hard-wired boat hoists are required to be GFCI protected.

- (D) **Kitchen Dishwasher Branch Circuit.** GFCI protection shall be provided for outlets that supply dishwashers installed in dwelling unit locations.

- (E) **Crawl Space Lighting Outlets.** GFCI protection shall be provided for lighting outlets not exceeding 120 volts installed in crawl spaces.

210.9 Circuits Derived from Autotransformers. Branch circuits shall not be derived from autotransformers unless the circuit supplied has a grounded conductor that is electrically connected to a grounded conductor of the system supplying the autotransformer.

Exception No. 1: An autotransformer shall be permitted without the connection to a grounded conductor where transforming from a nominal 208 volts to a nominal 240-volt supply or similarly from 240 volts to 208 volts.

Exception No. 2: In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the installation, autotransformers shall be permitted to supply nominal 600-volt loads from nominal 480-volt systems, and 480-volt loads from nominal 600-volt systems, without the connection to a similar grounded conductor.

An autotransformer requires little physical space and is economical and efficient. A buck-boost autotransformer provides a means of raising (boosting) or lowering (bucking) a supply line voltage by a small amount (usually no more than 20 percent). A buck-boost transformer has two primary windings (H_1-H_2 and H_3-H_4) connected to two secondary windings (X_1-X_2 and X_3-X_4). A single unit is used to boost/buck a single-phase voltage, but two or three units are used to boost/buck a 3-phase voltage.

In Exhibit 210.17, a 120-volt supply is derived from a 240-volt system. The grounded conductor of the primary system is electrically connected to the grounded conductor of the secondary system.

Exhibit 210.18 illustrates a common application that utilizes Exception No. 1. This circuit derives a single-phase, 240-volt supply system for ranges, air conditioners, heating elements, and motors from a 3-phase, 208Y/120-volt source system. The boosted leg should not be used to supply line-to-neutral loads, because the boosted line-to-neutral voltage will be higher than 120 volts.

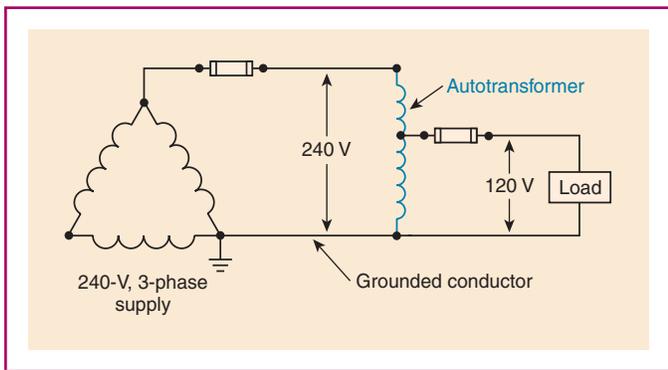

EXHIBIT 210.17 Circuitry for an autotransformer used to derive a 2-wire, 120-volt system for lighting or convenience receptacles from a 240-volt corner-grounded delta system.

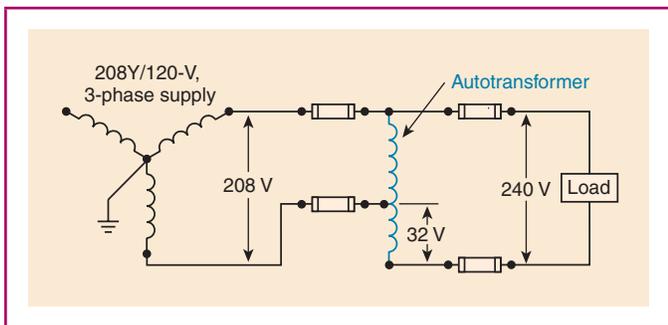

EXHIBIT 210.18 Circuitry for an autotransformer used to derive a 240-volt system for appliances from a 208Y/120-volt source.

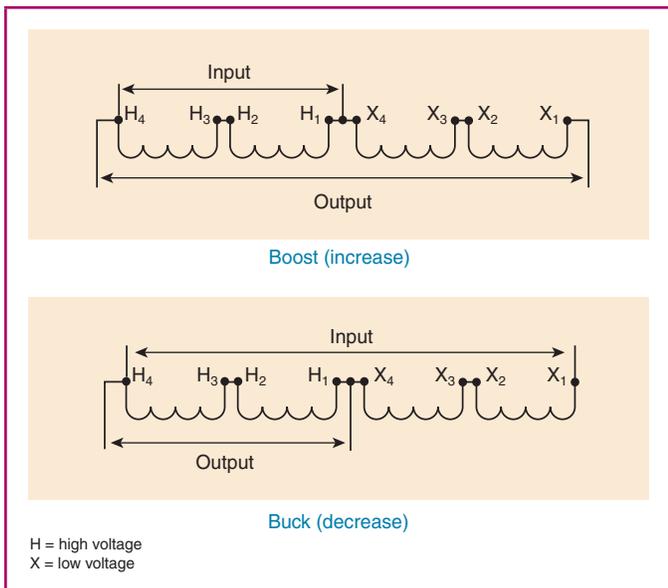

EXHIBIT 210.19 Typical single-phase connection diagrams for buck-boost transformers connected as autotransformers to change 240 volts single-phase to 208 volts and vice versa.

Other common applications include increasing a single-phase, 240-volt source to a single-phase, 277-volt supply for lighting systems and transforming 240 volts to 208 volts for use with 208-volt appliances. See [Exhibit 210.19](#). [Exhibit 210.20](#) illustrates typical 3-phase

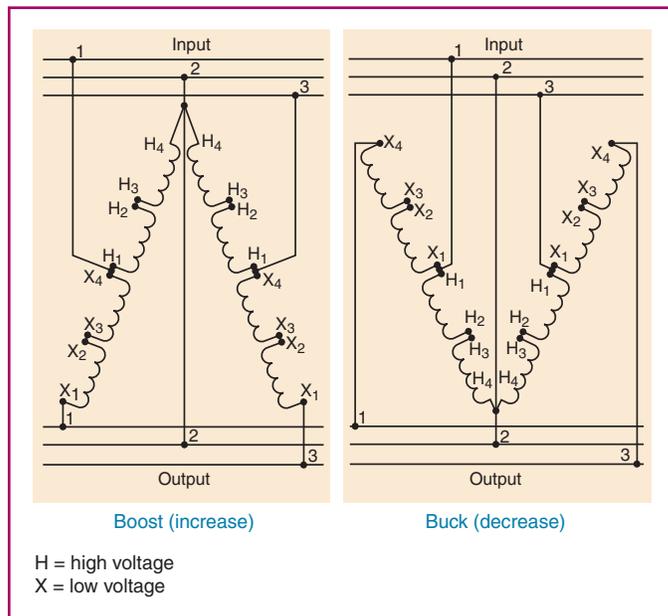

EXHIBIT 210.20 Typical connection diagrams for buck-boost transformers connected in 3-phase open delta as autotransformers to change 240 volts to 208 volts and vice versa.

buck-boost transformers connected to change 240 volts to 208 volts and vice versa.

210.10 Ungrounded Conductors Tapped from Grounded Systems.

Two-wire dc circuits and ac circuits of two or more ungrounded conductors shall be permitted to be tapped from the ungrounded conductors of circuits that have a grounded neutral conductor. Switching devices in each tapped circuit shall have a pole in each ungrounded conductor. All poles of multipole switching devices shall manually switch together where such switching devices also serve as a disconnecting means as required by the following:

- (1) [410.93](#) for double-pole switched lampholders
- (2) [410.104\(B\)](#) for electric-discharge lamp auxiliary equipment switching devices
- (3) [422.31\(B\)](#) for an appliance
- (4) [424.20](#) for a fixed electric space-heating unit
- (5) [426.51](#) for electric deicing and snow-melting equipment
- (6) [430.85](#) for a motor controller
- (7) [430.103](#) for a motor

[Exhibit 210.21](#) (top) illustrates an ungrounded 2-wire branch circuit tapped from the ungrounded conductors of a dc or single-phase system to supply a small motor. [Exhibit 210.21](#) (bottom) illustrates a 3-phase, 4-wire wye system. Based on the characteristics of the depicted loads (line-to-line connected) supplied by the tapped circuits, a neutral or grounded conductor is not required to be installed with the ungrounded conductors.

Circuit breakers or switches used as the disconnecting means for the tapped branch circuit must open all poles simultaneously using only the manual operation of the disconnecting means. If switches and fuses

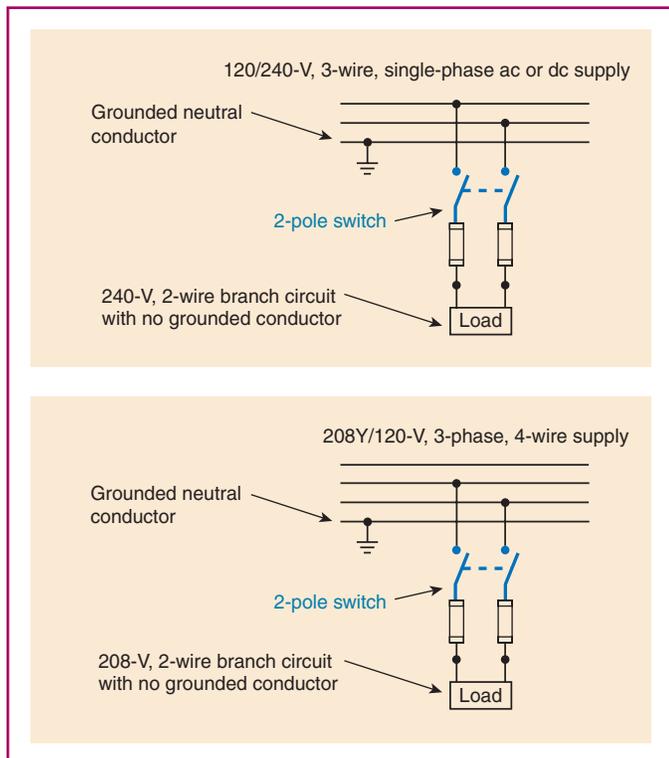

EXHIBIT 210.21 Branch circuits tapped from ungrounded conductors of multiwire systems.

are used and one fuse blows, or if circuit breakers (two single-pole circuit breakers with a handle tie) are used and one breaker trips, one pole could possibly remain closed. The intention is not to require a common trip of fuses or circuit breakers but rather to disconnect the ungrounded conductors of the branch circuit with one manual operation.

See also

240.15(B) for information on the use of identified handle ties with single-pole circuit breakers

210.11 Branch Circuits Required. Branch circuits for lighting and for appliances, including motor-operated appliances, shall be provided to supply the loads calculated in accordance with **220.10**. In addition, branch circuits shall be provided for specific loads not covered by **220.10** where required elsewhere in this *Code* and for dwelling unit loads as specified in **210.11(C)**.

(A) Number of Branch Circuits. The minimum number of branch circuits shall be determined from the total calculated load and the size or rating of the circuits used. In all installations, the number of circuits shall be sufficient to supply the load served. In no case shall the load on any circuit exceed the maximum specified by **220.18**.

(B) Load Evenly Proportioned Among Branch Circuits. Where the load is calculated on the basis of volt-amperes per square meter or per square foot, the wiring system up to and

including the branch-circuit panelboard(s) shall be provided to serve not less than the calculated load. This load shall be evenly proportioned among multioutlet branch circuits within the panelboard(s). Branch-circuit overcurrent devices and circuits shall be required to be installed only to serve the connected load.

(C) Dwelling Units.

(1) Small-Appliance Branch Circuits. In addition to the number of branch circuits required by other parts of this section, two or more 20-ampere small-appliance branch circuits shall be provided for all receptacle outlets specified by **210.52(B)**.

(2) Laundry Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s) required by **210.52(F)**. This circuit shall have no other outlets.

(3) Bathroom Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one 120-volt, 20-ampere branch circuit shall be provided to supply the bathroom(s) receptacle outlet(s). Such circuits shall have no other outlets.

Exception: Where the 20-ampere circuit supplies a single bathroom, outlets for other equipment within the same bathroom shall be permitted to be supplied in accordance with **210.23(A)(1)** and (A)(2).

The installation of a 20-ampere branch for the receptacles in each bathroom is not necessary. A single circuit can supply more than one bathroom.

(4) Garage Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one 120-volt, 20-ampere branch circuit shall be installed to supply receptacle outlets in attached garages and in detached garages with electric power. This circuit shall have no other outlets.

Exception: This circuit shall be permitted to supply readily accessible outdoor receptacle outlets.

210.12 Arc-Fault Circuit-Interrupter Protection. Arc-fault circuit-interrupter protection shall be provided as required in **210.12(A)**, (B), and (C). The arc-fault circuit interrupter shall be installed in a readily accessible location.

(A) Dwelling Units. All 120-volt, single-phase, 15- and 20-ampere branch circuits supplying outlets or devices installed in dwelling unit kitchens, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, laundry areas, or similar rooms or areas shall be protected by any of the means described in **210.12(A)(1)** through (6):

(1) A listed combination-type arc-fault circuit interrupter, installed to provide protection of the entire branch circuit

- (2) A listed branch/feeder-type AFCI installed at the origin of the branch-circuit in combination with a listed outlet branch-circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit. The first outlet box in the branch circuit shall be marked to indicate that it is the first outlet of the circuit.
- (3) A listed supplemental arc protection circuit breaker installed at the origin of the branch circuit in combination with a listed outlet branch-circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit where all of the following conditions are met:
 - a. The branch-circuit wiring shall be continuous from the branch-circuit overcurrent device to the outlet branch-circuit arc-fault circuit interrupter.
 - b. The maximum length of the branch-circuit wiring from the branch-circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG conductor or 21.3 m (70 ft) for a 12 AWG conductor.
 - c. The first outlet box in the branch circuit shall be marked to indicate that it is the first outlet of the circuit.

Listed AFCI devices are evaluated in accordance with UL 1699, *Standard for Arc-Fault Circuit-Interrupters*. Testing methods create or simulate arcing conditions to determine a product's ability to detect and interrupt arcing faults. These devices are also tested to verify that arc detection is not unduly inhibited by the presence of loads and circuit characteristics that may mask the hazardous arcing condition. In addition, these devices are evaluated to determine resistance to unwanted tripping due to the presence of arcing that occurs in control and utilization equipment under normal operating conditions or to a loading condition that closely mimics an arcing fault such as that found in a solid state electronic ballast or a dimmed load.

AFCI devices may also be capable of performing other functions such as overcurrent protection, ground-fault circuit interruption, and surge suppression. UL 1699 currently recognizes four types of AFCIs: branch/feeder, cord, outlet circuit, and portable. (See [Exhibit 210.22](#) for an example of the required marking indicating the type of AFCI protection.) AFCI devices have a maximum rating of 20 amperes and are intended for use in 120 volts ac, 60-hertz circuits. Cord AFCIs may be rated up to 30 amperes. Placement of the device in the circuit must be considered when complying with [210.12](#). Six possible configurations using listed equipment are permitted by the *NEC*. The objective of the *NEC* is to provide protection of the entire branch circuit. The configurations may use a single combination-type AFCI at the origin of the circuit, a combination of devices, or a combination of physical protection for part of the circuit and a device-type AFCI located downstream of the origin of the circuit. Where the AFCI is not located at the origin of the circuit, a higher level of physical protection must be provided for branch-circuit conductors from the origin of the branch circuit to the device-type AFCI. Some configurations have length restrictions to the first outlet, based on the size of the conductors (50 feet for 14 AWG and 70 feet for 12 AWG). [Commentary Table 210.2](#) summarizes the permitted methods of providing AFCI protection.

Branch-circuit/feeder-type AFCI devices provide arcing protection against parallel faults. An example of a parallel arcing fault is a cable

EXHIBIT 210.22 A circuit breaker with the required marking indicating the type of AFCI protection.

stapled to a wooden stud where the staple has been driven deeply into the cable jacket, damaging the conductor insulation. Combination-type AFCIs provide parallel arcing protection as well as protection against series arcing, such as could occur in a cord set.

AFCI protection is required for all 15- and 20-ampere, 120-volt branch circuits that supply outlets (including receptacle, lighting, and other outlets; see definition of *outlet* in [Article 100](#)) located throughout a dwelling unit. The requirement does not include outlets in bathrooms, unfinished basements, garages, and outdoors. Because circuits are often shared between a bedroom and other areas such as closets and hallways, providing AFCI protection on the complete circuit would comply with [210.12](#). AFCI protection on other circuits or locations other than those specified in [210.12\(A\)](#) is not prohibited.

- (4) A listed outlet branch-circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit in combination with a listed branch-circuit overcurrent protective device where all of the following conditions are met:
 - a. The branch-circuit wiring shall be continuous from the branch-circuit overcurrent device to the outlet branch-circuit arc-fault circuit interrupter.
 - b. The maximum length of the branch-circuit wiring from the branch-circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG conductor or 21.3 m (70 ft) for a 12 AWG conductor.
 - c. The first outlet box in the branch circuit shall be marked to indicate that it is the first outlet of the circuit.
 - d. The combination of the branch-circuit overcurrent device and outlet branch-circuit AFCI shall be identified as meeting the requirements for a system combination-type AFCI and shall be listed as such.

COMMENTARY TABLE 210.2 AFCI Protection Methods

210.12(A) Reference	AFCI Protection Method	Additional Installation Requirements
210.12(A)(1)	<ul style="list-style-type: none"> Combination-type AFCI circuit breaker installed at origin of branch circuit. 	<ul style="list-style-type: none"> No additional requirements

210.12(A)(3)	<ul style="list-style-type: none"> Supplemental arc protection-type circuit breaker installed at origin of branch circuit, plus Outlet branch-circuit-type AFCI device installed at first outlet in branch circuit. 	<ul style="list-style-type: none"> Continuous branch-circuit wiring “Home run” conductor length restricted Marking of first outlet box in branch circuit
210.12(A)(4)	<ul style="list-style-type: none"> Branch-circuit overcurrent protective device, plus Outlet branch-circuit-type AFCI device installed at first outlet in branch circuit. <p>The combination of devices must be listed and identified to provide <i>system combination-type</i> arc-fault protection for the “home run” conductors.</p>	<ul style="list-style-type: none"> Continuous branch-circuit wiring “Home run” conductor length restricted (50 ft for 14 AWG, 70 ft for 12 AWG) Marking of first outlet box in branch circuit
210.12(A)(5)	<ul style="list-style-type: none"> Outlet branch-circuit-type AFCI device installed at first outlet in branch circuit. 	<ul style="list-style-type: none"> Branch-circuit conductors installed in specific types of metal raceways or metal cables and metal boxes from origin of branch circuit to the first outlet
210.12(A)(6)	<ul style="list-style-type: none"> Outlet branch-circuit-type AFCI device installed at first outlet in branch circuit. 	<ul style="list-style-type: none"> Branch-circuit conduit, tubing, or cable encased in 2 in. of concrete from origin of branch circuit to the first outlet

- (5) If RMC, IMC, EMT, Type MC, or steel-armored Type AC cables meeting the requirements of 250.118, metal wireways, metal auxiliary gutters, and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a listed outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
- (6) Where a listed metal or nonmetallic conduit or tubing or Type MC cable is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a listed outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

Exception: Where an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) or 760.121(B) is installed in RMC, IMC, EMT, or steel-sheathed cable, Type AC or Type MC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Informational Note No. 1: For information on combination-type and branch/feeder-type arc-fault circuit interrupters, see UL 1699-2011, *Standard for Arc-Fault Circuit Interrupters*. For information on outlet branch-circuit type arc-fault circuit interrupters, see UL Subject 1699A, *Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters*. For information

on system combination AFCIs, see UL Subject 1699C, *Outline of Investigation for System Combination Arc-Fault Circuit Interrupters*.

Informational Note No. 2: See 29.6.3(5) of *NFPA 72-2013, National Fire Alarm and Signaling Code*, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

(B) Dormitory Units. All 120-volt, single-phase, 15- and 20-ampere branch circuits supplying outlets and devices installed in dormitory unit bedrooms, living rooms, hallways, closets, bathrooms, and similar rooms shall be protected by any of the means described in 210.12(A)(1) through (6).

(C) Guest Rooms and Guest Suites. All 120-volt, single-phase, 15- and 20-ampere branch circuits supplying outlets and devices installed in guest rooms and guest suites of hotels and motels shall be protected by any of the means described in 210.12(A)(1) through (6).

(D) Branch Circuit Extensions or Modifications — Dwelling Units and Dormitory Units. In any of the areas specified in 210.12(A) or (B), where branch-circuit wiring is modified, replaced, or extended, the branch circuit shall be protected by one of the following:

- (1) A listed combination-type AFCI located at the origin of the branch circuit

- (2) A listed outlet branch-circuit-type AFCI located at the first receptacle outlet of the existing branch circuit

Exception: AFCI protection shall not be required where the extension of the existing conductors is not more than 1.8 m (6 ft) and does not include any additional outlets or devices.

To address potential existing wiring system obstacles to providing some level of AFCI protection, the NEC provides the option of installing a combination-type device at the point where the branch circuit originates (as required for new branch-circuit installations) or of installing an outlet branch-circuit-type AFCI at the first receptacle outlet in the branch circuit.

210.13 Ground-Fault Protection of Equipment. Each branch-circuit disconnect rated 1000 A or more and installed on solidly grounded wye electrical systems of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase, shall be provided with ground-fault protection of equipment in accordance with the provisions of 230.95.

Informational Note: For buildings that contain health care occupancies, see the requirements of 517.17.

Exception No. 1: The provisions of this section shall not apply to a disconnecting means for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards.

Exception No. 2: The provisions of this section shall not apply if ground-fault protection of equipment is provided on the supply side of the branch circuit and on the load side of any transformer supplying the branch circuit.

Exceptions are provided for continuous industrial processes where shutdown could introduce additional or increased hazards, and for installations where ground-fault protection is provided upstream of the branch circuit on the load side of a transformer supplying the branch circuit.

See also

230.95 and its commentary for more information on ground-fault protection of equipment

210.17 Guest Rooms and Guest Suites. Guest rooms and guest suites that are provided with permanent provisions for cooking shall have branch circuits installed to meet the rules for dwelling units.

The guest suite configuration shown in Exhibit 210.23 triggers the requirement to install the branch-circuit wiring in this unit using all of the branch-circuit provisions that apply to dwelling units.

Part II. Branch-Circuit Ratings

210.18 Rating. Branch circuits recognized by this article shall be rated in accordance with the maximum permitted ampere rating or setting of the overcurrent device. The rating for other than individual branch circuits shall be 15, 20, 30, 40, and 50 amperes. Where conductors of higher ampacity are used for any reason,

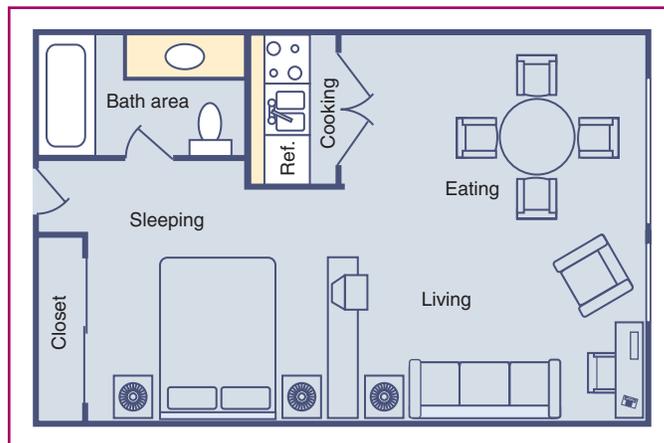

EXHIBIT 210.23 Guest rooms or suites with permanent provisions for cooking in which the installation of branch circuit must follow all of the requirements in Article 210 covering dwelling units.

the ampere rating or setting of the specified overcurrent device shall determine the circuit rating.

The rating of a branch circuit is determined by the rating of the overcurrent protective device, not by the ampacity of the circuit conductors. An increase in conductor ampacity from 20 amperes (12 AWG) to 30 amperes (10 AWG) for any reason does not change the rating of the circuit. If the rating of the branch-circuit overcurrent device is 20 amperes, then the rating of the circuit is 20 amperes.

Exception: Multioutlet branch circuits greater than 50 amperes shall be permitted to supply nonlighting outlet loads on industrial premises where conditions of maintenance and supervision ensure that only qualified persons service the equipment.

A common practice at industrial facilities is to provide several single receptacles with ratings of 50 amperes or higher on a single branch circuit to allow quick relocation of equipment (such as electric welders) for production or maintenance. Generally, only one piece of equipment at a time is supplied from this type of receptacle circuit. The type of receptacle used in this situation is generally a pin-and-sleeve receptacle.

210.19 Conductors — Minimum Ampacity and Size.

(A) Branch Circuits Not More Than 600 Volts.

Informational Note No. 1: See 310.15 for ampacity ratings of conductors.

Informational Note No. 2: See Part II of Article 430 for minimum rating of motor branch-circuit conductors.

Informational Note No. 3: See 310.15(A)(3) for temperature limitation of conductors.

Informational Note No. 4: Conductors for branch circuits as defined in Article 100, sized to prevent a voltage drop exceeding 3 percent at the farthest outlet of power, heating, and lighting loads, or combinations of such loads, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent, provide reasonable efficiency of operation. See Informational Note No. 2 of 215.2(A)(1) for voltage drop on feeder conductors.

Excessive voltage drop in supply conductors can cause inefficient operation or malfunction of electrical equipment. Under-voltage conditions reduce the capability and reliability of motors, lighting sources, heaters, and solid-state equipment. It may be necessary to compensate for this with an installation beyond the minimum requirements.

See also

215.2(A)(1)(b), Informational Note No. 3 commentary, and **Chapter 9, Table 9** commentary for sample voltage-drop calculations

(1) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. Conductors shall be sized to carry not less than the larger of **210.19(A)(1)(a)** or (b).

(a) Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.

(b) The minimum branch-circuit conductor size shall have an allowable ampacity not less than the maximum load to be served after the application of any adjustment or correction factors.

Exception: If the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the branch-circuit conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Conductors of branch circuits must be able to supply power to loads without overheating. The minimum conductor size and ampacity must be based on the larger of these criteria:

- The noncontinuous load plus 125 percent of the continuous load
- Not less than the maximum load to be served after the application of any adjustment or correction factors

It is not necessary to apply the additional 25 percent continuous load to the adjustment and correction factor calculations of **210.19(A)(1)(b)**.

See also

220.61 for sizing of the neutral conductor load

(2) Branch Circuits with More than One Receptacle. Conductors of branch circuits supplying more than one receptacle for cord-and-plug-connected portable loads shall have an ampacity of not less than the rating of the branch circuit.

The loading of branch-circuit conductors that supply receptacles for cord-and-plug-connected portable loads is unpredictable. The circuit conductors are required to have an ampacity that is not less than the rating of the branch circuit. The rating of the branch circuit is the rating of the overcurrent device according to **210.18**.

(3) Household Ranges and Cooking Appliances. Branch-circuit conductors supplying household ranges, wall-mounted ovens, counter-mounted cooking units, and other household cooking appliances shall have an ampacity not less than the rating of the branch circuit and not less than the maximum load to

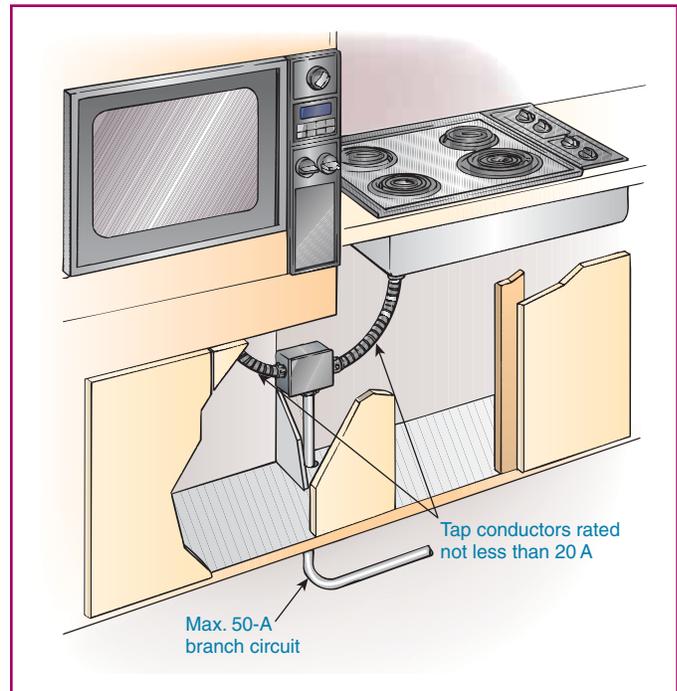

EXHIBIT 210.24 Tap conductors sized smaller than the branch-circuit conductors and not longer than necessary for servicing the appliances.

be served. For ranges of $8\frac{3}{4}$ kW or more rating, the minimum branch-circuit rating shall be 40 amperes.

Exception No. 1: Conductors tapped from a 50-ampere branch circuit supplying electric ranges, wall-mounted electric ovens, and counter-mounted electric cooking units shall have an ampacity of not less than 20 amperes and shall be sufficient for the load to be served. These tap conductors include any conductors that are a part of the leads supplied with the appliance that are smaller than the branch-circuit conductors. The taps shall not be longer than necessary for servicing the appliance.

Both factory-installed pigtails and field-installed conductors are considered to be tap conductors in applying this exception. This exception permits a 20-ampere tap conductor from a range, oven, or cooking unit to be connected to a 50-ampere branch circuit as illustrated in **Exhibit 210.24**.

Exception No. 2: The neutral conductor of a 3-wire branch circuit supplying a household electric range, a wall-mounted oven, or a counter-mounted cooking unit shall be permitted to be smaller than the ungrounded conductors where the maximum demand of a range of $8\frac{3}{4}$ -kW or more rating has been calculated according to Column C of **Table 220.55**, but such conductor shall have an ampacity of not less than 70 percent of the branch-circuit rating and shall not be smaller than 10 AWG.

Column C of **Table 220.55** indicates that the maximum demand for one range (not over 12-kilowatt rating) is 8 kilowatts (8000 VA; $8000 \text{ VA} \div 240 \text{ V} = 33.3 \text{ A}$). The allowable ampacity of an 8 AWG copper conductor from the 60°C column of **Table 310.15(B)(16)** is 40 amperes, and this conductor

may be used for the range branch circuit. According to this exception, the neutral of this 3-wire circuit can be smaller than 8 AWG but not smaller than 10 AWG. A 10 AWG conductor has an allowable ampacity of 30 amperes (30 amperes is more than 70 percent of 40 amperes). The maximum demand for the neutral of an 8-kilowatt range circuit seldom exceeds 25 amperes, because the only line-to-neutral connected loads are lights, clocks, timers, and the heating elements of some ranges when the control is adjusted to the low-heat setting.

(4) Other Loads. Branch-circuit conductors that supply loads other than those specified in 210.3 and other than cooking appliances as covered in 210.19(A)(3) shall have an ampacity sufficient for the loads served and shall not be smaller than 14 AWG.

Exception No. 1: Tap conductors shall have an ampacity sufficient for the load served. In addition, they shall have an ampacity of not less than 15 for circuits rated less than 40 amperes and not less than 20 for circuits rated at 40 or 50 amperes and only where these tap conductors supply any of the following loads:

- (a) Individual lampholders or luminaires with taps extending not longer than 450 mm (18 in.) beyond any portion of the lampholder or luminaire
- (b) A luminaire having tap conductors as provided in 410.117
- (c) Individual outlets, other than receptacle outlets, with taps not over 450 mm (18 in.) long
- (d) Infrared lamp industrial heating appliances
- (e) Nonheating leads of deicing and snow-melting cables and mats

Conductors are generally required to have the same ampacity as the branch-circuit overcurrent device. Exception No. 1 lists specific applications where the tap conductors are permitted to have reduced ampacities.

Exception No. 2: Fixture wires and flexible cords shall be permitted to be smaller than 14 AWG as permitted by 240.5.

(B) Branch Circuits Over 600 Volts. The ampacity of conductors shall be in accordance with 310.15 and 310.60, as applicable. Branch-circuit conductors over 600 volts shall be sized in accordance with 210.19(B)(1) or (B)(2).

(1) General. The ampacity of branch-circuit conductors shall not be less than 125 percent of the designed potential load of utilization equipment that will be operated simultaneously.

(2) Supervised Installations. For supervised installations, branch-circuit conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where both of the following conditions are met:

- (1) Conditions of design and installation are provided under engineering supervision.
- (2) Qualified persons with documented training and experience in over 600-volt systems provide maintenance, monitoring, and servicing of the system.

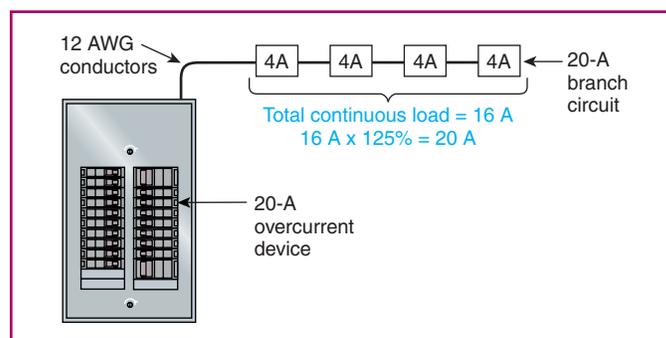

EXHIBIT 210.25 A continuous load calculated at 125 percent.

210.20 Overcurrent Protection. Branch-circuit conductors and equipment shall be protected by overcurrent protective devices that have a rating or setting that complies with 210.20(A) through (D).

(A) Continuous and Noncontinuous Loads. Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load.

Exhibit 210.25 is an example of a calculation of a minimum branch-circuit rating for a continuous load (store lighting).

Exception: Where the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the ampere rating of the overcurrent device shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Although 210.19(A)(1) requires that the circuit conductors have an ampacity based on the larger of these criteria:

- Not less than the sum of 100 percent of the noncontinuous load plus 125 percent of the continuous load
- Not less than the maximum load to be served after the application of any adjustment or correction factors

The rating of the overcurrent device cannot exceed the sum of 100 percent of the noncontinuous load plus 125 percent of the continuous load. Visit the *NEC Handbook* page at www.nfpa.org/nych for calculation examples that demonstrate sizing of conductors and overcurrent protective devices for various circuits.

See also

220.61 for sizing of the neutral conductor load

(B) Conductor Protection. Conductors shall be protected in accordance with 240.4. Flexible cords and fixture wires shall be protected in accordance with 240.5.

(C) Equipment. The rating or setting of the overcurrent protective device shall not exceed that specified in the applicable articles referenced in Table 240.3 for equipment.

(D) Outlet Devices. The rating or setting shall not exceed that specified in 210.21 for outlet devices.

210.21 Outlet Devices. Outlet devices shall have an ampere rating that is not less than the load to be served and shall comply with 210.21(A) and (B).

(A) Lampholders. Where connected to a branch circuit having a rating in excess of 20 amperes, lampholders shall be of the heavy-duty type. A heavy-duty lampholder shall have a rating of not less than 660 watts if of the admedium type, or not less than 750 watts if of any other type.

Only the admedium-base lampholder is recognized as heavy duty at the rating of 660 watts. Other lampholders are required to have a rating of not less than 750 watts to be recognized as heavy duty. This requirement prohibits the use of medium-base screw shell lampholders on branch circuits that are in excess of 20 amperes.

(B) Receptacles.

(1) Single Receptacle on an Individual Branch Circuit. A single receptacle installed on an individual branch circuit shall have an ampere rating not less than that of the branch circuit.

Exception No. 1: A receptacle installed in accordance with 430.81(B).

Exception No. 2: A receptacle installed exclusively for the use of a cord-and-plug-connected arc welder shall be permitted to have an ampere rating not less than the minimum branch-circuit conductor ampacity determined by 630.11(A) for arc welders.

Informational Note: See the definition of *receptacle* in Article 100.

A single receptacle installed on an individual branch circuit must have an ampere rating not less than that of the branch circuit. For example, a single receptacle on a 20-ampere individual branch circuit must be rated at 20 amperes in accordance with 210.21(B)(1); however, two or more 15-ampere single receptacles or a 15-ampere duplex receptacle are permitted on a 20-ampere branch circuit in accordance with 210.21(B)(3).

(2) Total Cord-and-Plug-Connected Load. Where connected to a branch circuit supplying two or more receptacles or outlets, a receptacle shall not supply a total cord-and-plug-connected load in excess of the maximum specified in Table 210.21(B)(2).

TABLE 210.21(B)(2) Maximum Cord-and-Plug-Connected Load to Receptacle

Circuit Rating (Amperes)	Receptacle Rating (Amperes)	Maximum Load (Amperes)
15 or 20	15	12
20	20	16
30	30	24

(3) Receptacle Ratings. Where connected to a branch circuit supplying two or more receptacles or outlets, receptacle ratings shall conform to the values listed in Table 210.21(B)(3), or, where rated higher than 50 amperes, the receptacle rating shall not be less than the branch-circuit rating.

TABLE 210.21(B)(3) Receptacle Ratings for Various Size Circuits

Circuit Rating (Amperes)	Receptacle Rating (Amperes)
15	Not over 15
20	15 or 20
30	30
40	40 or 50
50	50

Exception No. 1: Receptacles installed exclusively for the use of one or more cord-and-plug-connected arc welders shall be permitted to have ampere ratings not less than the minimum branch-circuit conductor ampacity determined by 630.11(A) or (B) for arc welders.

Exception No. 2: The ampere rating of a receptacle installed for electric discharge lighting shall be permitted to be based on 410.62(C).

(4) Range Receptacle Rating. The ampere rating of a range receptacle shall be permitted to be based on a single range demand load as specified in Table 220.55.

210.22 Permissible Loads, Individual Branch Circuits. An individual branch circuit shall be permitted to supply any load for which it is rated, but in no case shall the load exceed the branch-circuit ampere rating.

Electric vehicle supply equipment is an example of equipment that is supplied by an individual branch circuit.

See also

625.40 for more information on electric vehicle branch circuits

210.23 Permissible Loads, Multiple-Outlet Branch Circuits. In no case shall the load exceed the branch-circuit ampere rating. A branch circuit supplying two or more outlets or receptacles shall supply only the loads specified according to its size as specified in 210.23(A) through (D) and as summarized in 210.24 and Table 210.24.

(A) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both, and shall comply with 210.23(A)(1) and (A)(2).

Exception: The small-appliance branch circuits, laundry branch circuits, and bathroom branch circuits required in a dwelling unit(s) by 210.11(C)(1), (C)(2), and (C)(3) shall supply only the receptacle outlets specified in that section.

(1) Cord-and-Plug-Connected Equipment Not Fastened in Place. The rating of any one cord-and-plug-connected utilization equipment not fastened in place shall not exceed 80 percent of the branch-circuit ampere rating.

(2) Utilization Equipment Fastened in Place. The total rating of utilization equipment fastened in place, other than luminaires, shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord-and-plug-connected utilization equipment not fastened in place, or both, are also supplied.

A 15- or 20-ampere branch circuit supplying lighting outlets may also supply utilization equipment fastened in place, such as a dishwasher. The utilization equipment load, whether direct wired or cord and plug connected, must not exceed 50 percent of the branch-circuit ampere rating (7.5 amperes on a 15-ampere circuit and 10 amperes on a 20-ampere circuit).

The requirement does not apply to a branch circuit that supplies only fastened-in-place utilization equipment. For example, on a 20-ampere branch circuit that supplies a waste disposer and a dishwasher, neither appliance is restricted to 50 percent (10 amperes) of the branch-circuit rating. The combined load of the two appliances cannot exceed 20 amperes.

(B) 30-Ampere Branch Circuits. A 30-ampere branch circuit shall be permitted to supply fixed lighting units with heavy-duty lampholders in other than a dwelling unit(s) or utilization equipment in any occupancy. A rating of any one cord-and-plug-connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating.

(C) 40- and 50-Ampere Branch Circuits. A 40- or 50-ampere branch circuit shall be permitted to supply cooking appliances that are fastened in place in any occupancy. In other than dwelling units, such circuits shall be permitted to supply fixed lighting units with heavy-duty lampholders, infrared heating units, or other utilization equipment.

(D) Branch Circuits Larger Than 50 Amperes. Branch circuits larger than 50 amperes shall supply only nonlighting outlet loads.

See also

210.18, Exception, and its commentary regarding multioutlet branch circuits greater than 50 amperes that are permitted to supply non-lighting outlet loads at industrial premises

210.24 Branch-Circuit Requirements — Summary. The requirements for circuits that have two or more outlets or receptacles, other than the receptacle circuits of 210.11(C)(1), (C)(2), and (C)(3), are summarized in Table 210.24. This table provides only a summary of minimum requirements. See 210.19, 210.20, and 210.21 for the specific requirements applying to branch circuits.

Table 210.24 summarizes the general branch-circuit requirements where two or more outlets are supplied. Small appliance, laundry, and bathroom circuits supplying receptacles are not included, and no allowance is made for conditions of use or adjustments.

The circuit rating is determined by the rating of the overcurrent device based on 210.3. The allowable tap conductor ampacity is governed by Exception No. 1 of 210.19(A)(4). The circuit conductor and tap conductor size are directly from the 60°C column of Table 310.15(B)(16). The receptacle ratings are from Table 210.21(B)(3), while the permissible uses with lampholders are based on 210.23.

210.25 Branch Circuits in Buildings with More Than One Occupancy.

(A) Dwelling Unit Branch Circuits. Branch circuits in each dwelling unit shall supply only loads within that dwelling unit or loads associated only with that dwelling unit.

(B) Common Area Branch Circuits. Branch circuits installed for the purpose of lighting, central alarm, signal, communications, or other purposes for public or common areas of a two-family dwelling, a multifamily dwelling, or a multi-occupancy

TABLE 210.24 Summary of Branch-Circuit Requirements

Circuit Rating	15 A	20 A	30 A	40 A	50 A
Conductors (min. size):					
Circuit wires ¹	14	12	10	8	6
Taps	14	14	14	12	12

Outlet devices:					
Lampholders permitted	Any type	Any type	Heavy duty	Heavy duty	Heavy duty
Receptacle rating ²	15 max. A	15 or 20 A	30 A	40 or 50 A	50 A
Maximum Load	15 A	20 A	30 A	40 A	50 A
Permissible load	See 210.23(A)	See 210.23(A)	See 210.23(B)	See 210.23(C)	See 210.23(C)

¹These gauges are for copper conductors.

²For receptacle rating of cord-connected electric-discharge luminaires, see 410.62(C).

building shall not be supplied from equipment that supplies an individual dwelling unit or tenant space.

In addition to prohibiting branch circuits from feeding more than one dwelling unit, 210.25 also prohibits an individual dwelling unit branch circuit from supplying shared systems, equipment, or common lighting. Common area circuits in occupancies other than dwelling units are subject to this requirement. "House load" branch circuits must be supplied from equipment that does not directly supply branch circuits for an individual occupancy or tenant space. This requirement permits access to the branch-circuit disconnecting means without the need to enter the space of any tenants. The requirement also prevents a tenant from turning off important circuits that may affect other tenants.

Part III. Required Outlets

210.50 General. Receptacle outlets shall be installed as specified in 210.52 through 210.64.

Informational Note: See **Informative Annex J** for information regarding ADA accessibility design.

(A) Cord Pendants. A cord connector that is supplied by a permanently connected cord pendant shall be considered a receptacle outlet.

(B) Cord Connections. A receptacle outlet shall be installed wherever flexible cords with attachment plugs are used. Where flexible cords are permitted to be permanently connected, receptacles shall be permitted to be omitted for such cords.

(C) Appliance Receptacle Outlets. Appliance receptacle outlets installed in a dwelling unit for specific appliances, such as laundry equipment, shall be installed within 1.8 m (6 ft) of the intended location of the appliance.

See also

210.52(F) and 210.11(C)(2) for requirements regarding laundry receptacle outlets and branch circuits

210.52 Dwelling Unit Receptacle Outlets. This section provides requirements for 125-volt, 15- and 20-ampere receptacle outlets. The receptacles required by this section shall be in addition to any receptacle that is:

- (1) Part of a luminaire or appliance, or
- (2) Controlled by a wall switch in accordance with 210.70(A)(1), Exception No. 1, or
- (3) Located within cabinets or cupboards, or
- (4) Located more than 1.7 m (5½ ft) above the floor

Permanently installed electric baseboard heaters equipped with factory-installed receptacle outlets or outlets provided as a separate assembly by the manufacturer shall be permitted as the required outlet or outlets for the wall space utilized by such permanently installed heaters. Such receptacle outlets shall not be connected to the heater circuits.

Informational Note: Listed baseboard heaters include instructions that may not permit their installation below receptacle outlets.

An outlet containing a duplex receptacle that is wired so that only one of the receptacles is controlled by a wall switch can be used to meet the receptacle outlet spacing requirement. However, if both halves are controlled by a wall switch(es), an additional unswitched receptacle has to be installed to meet the receptacle outlet spacing requirement. Where both halves of the duplex receptacle are controlled by a wall switch, the occupant may run an extension cord from a receptacle that is not controlled by a switch to an appliance that requires continuous power.

(A) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, bedroom, recreation room, or similar room or area of dwelling units, receptacle outlets shall be installed in accordance with the general provisions specified in 210.52(A)(1) through (A)(4).

(1) Spacing. Receptacles shall be installed such that no point measured horizontally along the floor line of any wall space is more than 1.8 m (6 ft) from a receptacle outlet.

Receptacle outlets are to be installed so that an appliance or lamp with an attached flexible cord may be placed anywhere in the room near a wall and be within 6 feet of a receptacle, minimizing the need for occupants to use extension cords. The receptacle layout may be designed for intended utilization equipment or practical room use. For example, receptacles in a family room that are intended to serve home entertainment equipment may be grouped or placed for convenience. Receptacles intended for window-type holiday lighting may be placed under windows. Even if more receptacles than the minimum required are installed in a room, no point in any wall space is permitted to be more than 6 feet from a receptacle.

(2) Wall Space. As used in this section, a wall space shall include the following:

- (1) Any space 600 mm (2 ft) or more in width (including space measured around corners) and unbroken along the floor line by doorways and similar openings, fireplaces, and fixed cabinets that do not have countertops or similar work surfaces
- (2) The space occupied by fixed panels in walls, excluding sliding panels
- (3) The space afforded by fixed room dividers, such as free-standing bar-type counters or railings

(3) Floor Receptacles. Receptacle outlets in or on floors shall not be counted as part of the required number of receptacle outlets unless located within 450 mm (18 in.) of the wall.

Any wall space that is unbroken along the floor line by doorways, fireplaces, archways, and similar openings must be included in the measurement. The wall space may include two or more walls of a room (around corners) as illustrated in Exhibit 210.26.

Fixed room dividers, such as bar-type counters and railings, are required to be included in the 6-foot measurement. Fixed glass panels in exterior walls are counted as wall space, and a floor-type receptacle close to the wall can be used to meet the required spacing. Isolated, individual wall spaces 2 feet or more in width, which are often used for small pieces of furniture on which a lamp or an appliance may be placed, are required to have a receptacle outlet to preclude the use of an extension cord to supply equipment in such an isolated space.

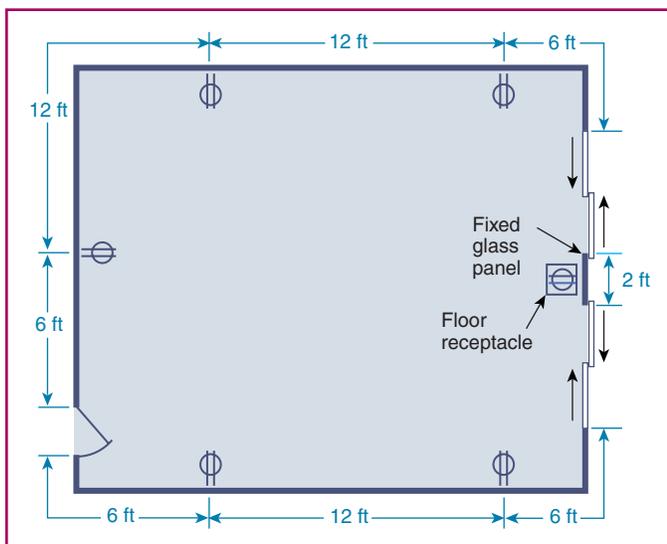

EXHIBIT 210.26 A typical room plan view of the location of dwelling unit receptacles that meet NEC requirements.

The word *usable* does not appear at all in 210.52(A)(2) as a condition for determining compliance with the receptacle-spacing requirements. As an example, to correctly determine the dimension of the wall line in a room, the wall space behind the swing of a door is included in the measurement. This does not mean that the receptacle outlet has to be located in that space, only that the space is included in the wall-line measurement.

(4) Countertop and Similar Work Surface Receptacle Outlets. Receptacles installed for countertop and similar work surfaces as specified in 210.52(C) shall not be considered as the receptacle outlets required by 210.52(A).

Because of the need to provide a sufficient number of receptacles for the appliances used at the kitchen counter area, receptacle outlets installed to serve kitchen or dining area counters cannot also be used as the required receptacle outlet for an adjacent wall space that is subject to the requirements of 210.52(A)(1) and (A)(2).

(B) Small Appliances.

(1) Receptacle Outlets Served. In the kitchen, pantry, breakfast room, dining room, or similar area of a dwelling unit, the two or more 20-ampere small-appliance branch circuits required by 210.11(C)(1) shall serve all wall and floor receptacle outlets covered by 210.52(A), all countertop outlets covered by 210.52(C), and receptacle outlets for refrigeration equipment.

The limited exceptions to 210.52(B)(2) keep loads for specific equipment to a minimum so that the majority of the circuit capacity is dedicated to supplying cord-and-plug-connected portable appliance loads. The NEC restricts the loads supplied by these receptacle circuits because the number of cord-and-plug-connected portable appliances used by occupants is generally undetermined. Receptacles and other types of outlets in other locations, such as in cabinets, are not permitted to be connected to the small-appliance branch circuit. Such outlets reduce the capacity to supply portable appliances used at a kitchen counter.

No restriction is placed on the number of outlets connected to a general-lighting or small-appliance branch circuit. The minimum number of receptacle outlets in a room is determined by 210.52(A) based on the room perimeter and on 210.52(C) for counter spaces. Installing more than the required minimum number of receptacle outlets can also help reduce the need for extension cords and cords lying across counters.

Exhibit 210.27 illustrates the application of the requirements of 210.52(B)(1), (B)(2), and (B)(3). Only the counter area is required to be

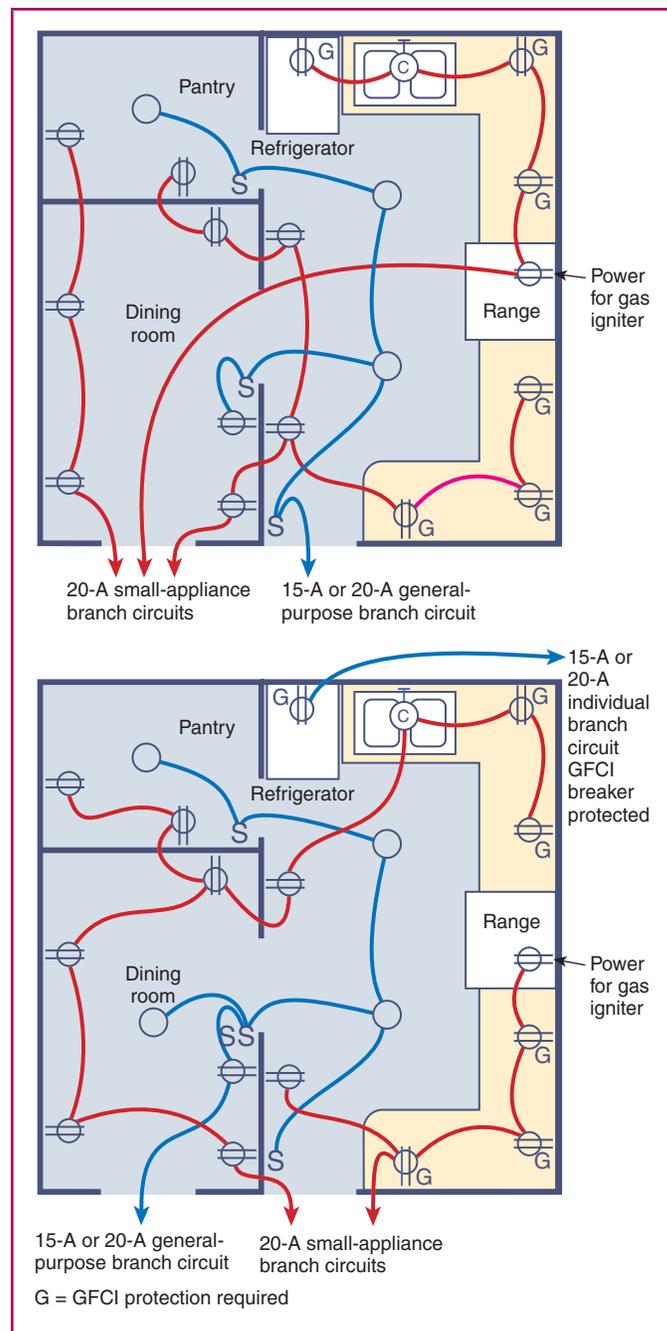

EXHIBIT 210.27 Small-appliance branch circuits as required for all receptacle outlets in the kitchen (including refrigerator), pantry, and dining room.

supplied by both of the small-appliance branch circuits. The wall receptacle outlets in the kitchen and dining room are permitted to be supplied by one or both of the circuits as shown in the two diagrams.

Exception No. 1: In addition to the required receptacles specified by 210.52, switched receptacles supplied from a general-purpose branch circuit as defined in 210.70(A)(1), Exception No. 1, shall be permitted.

Switched receptacles supplied from general-purpose 15-ampere branch circuits may be located in kitchens, pantries, breakfast rooms, and similar areas. See 210.70(A) and Exhibit 210.27 for details.

Exception No. 2: In addition to the required receptacles specified by 210.52, a receptacle outlet to serve a specific appliance shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.

This exception allows a choice for refrigeration equipment receptacle outlets located in a kitchen or similar area. An individual 15-ampere or larger branch circuit may serve this equipment, or it may be included in the 20-ampere small-appliance branch circuit. Refrigeration equipment is exempt from the GFCI requirements of 210.8 where the receptacle outlet is greater than 6 feet from the edge of any sink and where it is located so that it cannot be used to serve countertop surfaces as shown in Exhibit 210.27.

(2) No Other Outlets. The two or more small-appliance branch circuits specified in 210.52(B)(1) shall have no other outlets.

Exception No. 1: A receptacle installed solely for the electrical supply to and support of an electric clock in any of the rooms specified in 210.52(B)(1).

Exception No. 2: Receptacles installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units.

Because of the comparatively small load associated with ignition controls and other electronics, gas-fired appliances are permitted to be supplied by a receptacle connected to one of the small-appliance branch circuits. See Exhibit 210.27 for an illustration.

(3) Kitchen Receptacle Requirements. Receptacles installed in a kitchen to serve countertop surfaces shall be supplied by not fewer than two small-appliance branch circuits, either or both of which shall also be permitted to supply receptacle outlets in the same kitchen and in other rooms specified in 210.52(B)(1). Additional small-appliance branch circuits shall be permitted to supply receptacle outlets in the kitchen and other rooms specified in 210.52(B)(1). No small-appliance branch circuit shall serve more than one kitchen.

In most dwellings, the countertop receptacle outlets supply more of the portable cooking appliances than the wall receptacles in the kitchen and dining areas, hence the requirement for the counter areas to be supplied by no fewer than two small-appliance branch circuits. The NEC does not specify that both circuits be installed to serve the receptacle outlet(s) at each separate counter area in a kitchen, but rather that the total counter area of a kitchen must be supplied by no fewer than two circuits, and the

arrangement of these circuits is determined by the designer or installer. For example, a single receptacle outlet on a kitchen island is not required to be supplied by both of the small-appliance circuits serving the counter area.

The concept of evenly proportioning the load as specified in 210.11(B) (for loads calculated on the basis of volt-amperes per square foot) can be used as a best practice in distributing the number of receptacle outlets to be supplied by each of the small-appliance branch circuits. If additional small-appliance branch circuits are installed, they are subject to all the requirements that apply to the minimum two required circuits.

The two circuits that supply the countertop receptacle outlets may also supply receptacle outlets in the pantry, dining room, and breakfast room, as well as an electric clock receptacle and electric loads associated with gas-fired appliances. However, these circuits are to supply no other outlets/loads such as outdoor lighting or an outdoor receptacle.

210.8(A)(6) for the GFCI requirements that apply to receptacles serving kitchen counters

(C) Countertops and Work Surfaces. In kitchens, pantries, breakfast rooms, dining rooms, and similar areas of dwelling units, receptacle outlets for countertop and work surfaces shall be installed in accordance with 210.52(C)(1) through (C)(5).

(1) Wall Countertop and Work Surface. A receptacle outlet shall be installed at each wall countertop and work surface that is 300 mm (12 in.) or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm (24 in.) measured horizontally from a receptacle outlet in that space.

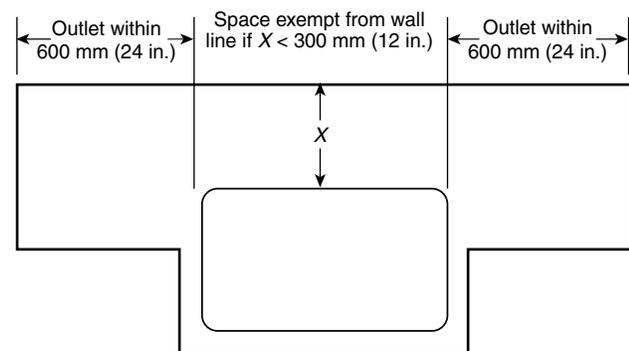

Exception: Receptacle outlets shall not be required on a wall directly behind a range, counter-mounted cooking unit, or sink in the installation described in Figure 210.52(C)(1).

This exception and Figure 210.52(C)(1) define the wall space behind a sink, range, or counter-mounted cooking unit that is not required to be provided with a receptacle outlet. Figure 210.52(C)(1) shows the wall space behind the sink or range that is exempt from the wall line measurement. Where the space behind a sink, range, or counter-mounted cooking unit is 12 inches or more (or 18 inches for corner-mounted configurations), the space must be included in measuring the wall counter space. Receptacle outlets are not prohibited from being installed in this space.

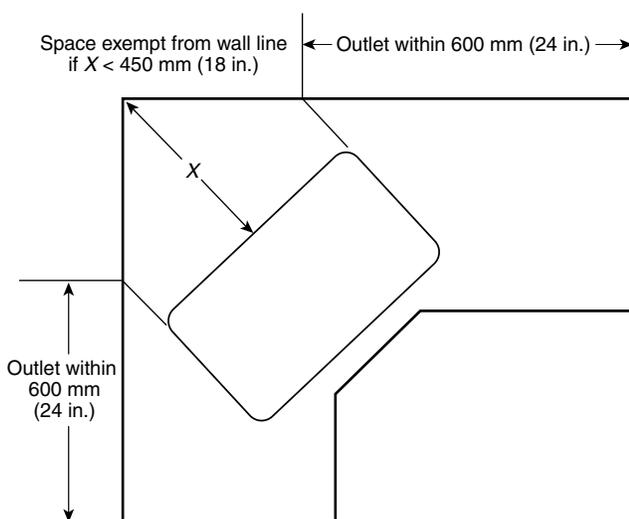

(2) Island Countertop Spaces. At least one receptacle shall be installed at each island countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater.

(3) Peninsular Countertop Spaces. At least one receptacle outlet shall be installed at each peninsular countertop long dimension space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. A peninsular countertop is measured from the connected perpendicular wall.

(4) Separate Spaces. Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate

Range, counter-mounted cooking unit extending from face of counter

Range, counter-mounted cooking unit mounted in corner

FIGURE 210.52(C)(1) Determination of Area Behind a Range, Counter-Mounted Cooking Unit, or Sink.

countertop spaces in applying the requirements of 210.52(C)(1). If a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the depth of the countertop behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.), the range, counter-mounted cooking unit, or sink shall be considered to divide the countertop space into two separate countertop spaces. Each separate countertop space shall comply with the applicable requirements in 210.52(C).

The general receptacle outlet requirement for qualifying island and peninsular countertop spaces in 210.52(C)(2) and (C)(3) calls for one receptacle outlet regardless of the size of the countertop space. However, if the island or peninsula countertop is separated into two spaces, such as by a cooktop or a sink, and each space meets the minimum dimension criteria in 210.52(C)(2) and (C)(3), a minimum of one receptacle outlet is required for each countertop space.

(5) Receptacle Outlet Location. Receptacle outlets shall be located on or above, but not more than 500 mm (20 in.) above,

the countertop or work surface. Receptacle outlet assemblies listed for use in countertops or work surfaces shall be permitted to be installed in countertops or work surfaces. Receptacle outlets rendered not readily accessible by appliances fastened in place, appliance garages, sinks, or rangetops as covered in 210.52(C)(1), Exception, or appliances occupying dedicated space shall not be considered as these required outlets.

Informational Note: See 406.5(E) and 406.5(G) for requirements for installation of receptacles in countertops and 406.5(F) and 406.5(G) for requirements for installation of receptacles in work surfaces.

Exception to (5): To comply with the following conditions (1) and (2), receptacle outlets shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop or work surface. Receptacles mounted below a countertop or work surface in accordance with this exception shall not be located where the countertop or work surface extends more than 150 mm (6 in.) beyond its support base.

- (1) Construction for the physically impaired
- (2) On island and peninsular countertops or work surface where the surface is flat across its entire surface (no back-splashes, dividers, etc.) and there are no means to mount a receptacle within 500 mm (20 in.) above the countertop or work surface, such as an overhead cabinet

Dwelling unit receptacles that serve countertop spaces in kitchens, dining areas, and similar rooms, as illustrated in Exhibit 210.28, are required to be installed as follows:

- 1 In each wall space wider than 12 inches and spaced so that no point along the wall line is more than 24 inches from a receptacle
- 2 At each countertop island and peninsular countertop with a short dimension of at least 12 inches and a long dimension of at least 24 inches (The measurement of a peninsular-type countertop is from the edge of the counter to the connected perpendicular wall.)
- 3 Accessible for use and not blocked by appliances occupying dedicated space or fastened in place
- 4 Fed from two or more of the required 20-ampere small-appliance branch circuits and GFCI protected according to 210.8(A)(6)
- 5 Not more than 20 inches above the countertop (According to 406.5, receptacles cannot be installed in a face-up position, unless specifically listed countertop or work surface applications. Receptacles installed in a face-up position in a countertop could collect crumbs, liquids, and other debris, resulting in a potential fire or shock hazard.)

The standard practice is installing a cabinet 18 inches above the countertop. The 20 inches allows for this requirement to be met by installing multioutlet assemblies on the bottom of the upper cabinets.

(D) Bathrooms. At least one receptacle outlet shall be installed in bathrooms within 900 mm (3 ft) of the outside edge of each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop, located on the countertop, or installed on the side or face of the basin cabinet. In no case shall the receptacle be located more than 300 mm (12 in.)

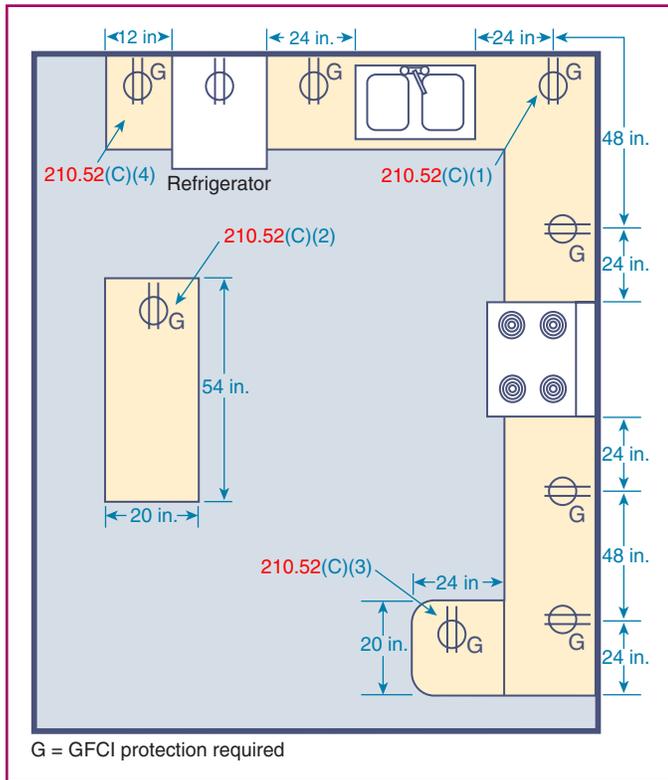

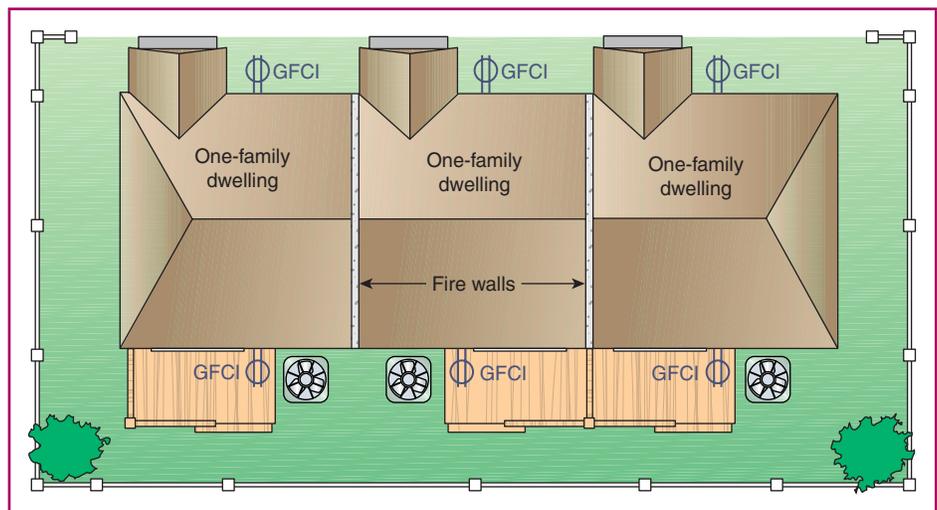

EXHIBIT 210.28 Dwelling unit receptacles serving countertop spaces in a kitchen and arranged in accordance with 210.52(C)(1) through (C)(4).

below the top of the basin or basin countertop. Receptacle outlet assemblies listed for use in countertops shall be permitted to be installed in the countertop.

Informational Note: See 406.5(E) and 406.5(G) for requirements for installation of receptacles in countertops.

The permission to install a receptacle outlet on the basin cabinet is not contingent on the adjacent wall location being infeasible. This receptacle is also required to be GFCI protected in accordance with 210.8(A)(1). This

EXHIBIT 210.29 Three one-family dwellings (separated from each other by fire walls) with GFCI-protected receptacles located at the front and the back of each dwelling.

receptacle is required in addition to any receptacle that is part of any luminaire or medicine cabinet. If there is more than one basin, a receptacle outlet is required adjacent to each basin location. One receptacle outlet within 36 inches off both basins can be used to satisfy this requirement.

Section 210.11(C)(3) requires that receptacle outlets be supplied from a 20-ampere branch circuit with no other outlets. However, this circuit is permitted to supply the required receptacle outlets in more than one bathroom. If the circuit supplies the required receptacle outlet in only one bathroom, it is also allowed to supply lighting and an exhaust fan in that bathroom, provided the lighting and fan load does not exceed that permitted by 210.23(A)(2).

See also

406.9(C), which prohibits installation of a receptacle over a bathtub or inside a shower stall

Exhibit 210.9 for a sample electrical layout of a bathroom

(E) Outdoor Outlets. Outdoor receptacle outlets shall be installed in accordance with 210.52(E)(1) through (E)(3).

Informational Note: See 210.8(A)(3).

Outdoor receptacles must be installed so that the receptacle faceplate rests securely on the supporting surface to prevent moisture from entering the enclosure. On uneven surfaces such as brick, stone, or stucco, it may be necessary to use mounting blocks or to close openings with caulking compound or mastic.

See also

406.9 for more information on receptacles installed in damp or wet locations

(1) One-Family and Two-Family Dwellings. For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet readily accessible from grade and not more than 2.0 m (6½ ft) above grade level shall be installed at the front and back of the dwelling.

Two outdoor receptacle outlets are required for each dwelling unit. One receptacle outlet is required at the front and the back as shown in Exhibit 210.29. The two required receptacle outlets are to be available to

a person standing on the ground (at grade level). Where outdoor heating and air-conditioning (HVAC) equipment is located at grade level, the receptacle outlets required by this section can be used to comply with the requirement of 210.63, provided that one of the outlets is located within 25 feet of the HVAC equipment. Outdoor receptacle outlets on decks, porches, and similar structures can be used to meet 210.52(E) as long as the receptacle outlet is not more than 6½ feet above grade and can be accessed by a person standing at grade.

(2) Multifamily Dwellings. For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet readily accessible from grade and not more than 2.0 m (6½ ft) above grade level shall be installed.

This requirement applies to the dwelling units that are located at grade level and have a doorway that leads directly to the exterior of the structure. The unauthorized use of the outdoor receptacle outlet by other than the dwelling occupant(s) can be allayed by using a switch inside the dwelling unit to control the outlet. Due to the spatial constraints often associated with the construction of multifamily units, the required receptacle outlet is permitted to be accessible “from grade” rather than “while standing at grade,” as is the case for one- and two-family dwellings. An outdoor receptacle outlet located 6½ feet or less above grade and accessible by walking up a set of deck or porch steps can be used to meet this requirement.

(3) Balconies, Decks, and Porches. Balconies, decks, and porches that are attached to the dwelling unit and are accessible from inside the dwelling unit shall have at least one receptacle outlet accessible from the balcony, deck, or porch. The receptacle outlet shall not be located more than 2.0 m (6½ ft) above the balcony, deck, or porch walking surface.

Regardless of area, a porch, balcony, or deck must have at least one receptacle outlet installed within its perimeter. This requirement only applies to porches, balconies, or decks that are accessible from inside the unit. Because it is an outdoor receptacle, GFCI protection is required. Depending on the location of the porch, balcony, or deck, the receptacle outlet can also be used to meet the receptacle requirements of 210.52(E)(1) and (E)(2). The receptacle must be not more than 6½ feet above the balcony, deck, or porch walking surface.

(F) Laundry Areas. In dwelling units, at least one receptacle outlet shall be installed in areas designated for the installation of laundry equipment.

Exception No. 1: A receptacle for laundry equipment shall not be required in a dwelling unit of a multifamily building where laundry facilities are provided on the premises for use by all building occupants.

Exception No. 2: A receptacle for laundry equipment shall not be required in other than one-family dwellings where laundry facilities are not to be installed or permitted.

A laundry receptacle outlet(s) is supplied by a 20-ampere branch circuit that can have no other outlets.

See also

210.11(C)(2) for more information on laundry branch circuits

(G) Basements, Garages, and Accessory Buildings. For one- and two-family dwellings, at least one receptacle outlet shall be installed in the areas specified in 210.52(G)(1) through (3). These receptacles shall be in addition to receptacles required for specific equipment.

(1) Garages. In each attached garage and in each detached garage with electric power, at least one receptacle outlet shall be installed in each vehicle bay and not more than 1.7 m (5½ ft) above the floor.

(2) Accessory Buildings. In each accessory building with electric power.

(3) Basements. In each separate unfinished portion of a basement.

A receptacle must be installed in the basement (in addition to the laundry receptacle), in each separate area of a basement, in each attached garage, and in each detached garage and accessory building with electric power. Receptacle outlets are not required for a detached garage if it is not supplied with electricity.

GFCI protection is required by 210.8(A)(5) for receptacles in unfinished basements and by 210.8(A)(2) for receptacles installed in garages. Circuits that supply receptacle outlets in a garage can only supply receptacle outlets in the garage and readily accessible outdoor receptacle outlets.

See also

210.11(C)(4) for more information on garage branch circuits

(H) Hallways. In dwelling units, hallways of 3.0 m (10 ft) or more in length shall have at least one receptacle outlet.

As used in this subsection, the hallway length shall be considered the length along the centerline of the hallway without passing through a doorway.

This requirement is intended to minimize strain or damage to cords and receptacles for dwelling unit receptacles. The requirement does not apply to common hallways of hotels, motels, apartment buildings, condominiums, and similar occupancies.

(I) Foyers. Foyers that are not part of a hallway in accordance with 210.52(H) and that have an area that is greater than 5.6 m² (60 ft²) shall have a receptacle(s) located in each wall space 900 mm (3 ft) or more in width. Doorways, door-side windows that extend to the floor, and similar openings shall not be considered wall space.

Foyers are not included in the living spaces covered by 210.52(A) even though they may have comparable dimensions in some cases. This requirement provides for receptacle outlets in these spaces to accommodate lamps or other utilization equipment. The primary objective of the requirements covering any of the dwelling areas included in 210.52 is to minimize the need to use extension cords to supply utilization equipment.

210.60 Guest Rooms, Guest Suites, Dormitories, and Similar Occupancies.

(A) General. Guest rooms or guest suites in hotels, motels, sleeping rooms in dormitories, and similar occupancies shall

have receptacle outlets installed in accordance with 210.52(A) and (D). Guest rooms or guest suites provided with permanent provisions for cooking shall have receptacle outlets installed in accordance with all of the applicable rules in 210.52.

(B) Receptacle Placement. In applying the provisions of 210.52(A), the total number of receptacle outlets shall not be less than the minimum number that would comply with the provisions of that section. These receptacle outlets shall be permitted to be located conveniently for permanent furniture layout. At least two receptacle outlets shall be readily accessible. Where receptacles are installed behind the bed, the receptacle shall be located to prevent the bed from contacting any attachment plug that may be installed or the receptacle shall be provided with a suitable guard.

The receptacles in guest rooms and guest suites of hotels and motels and in dormitories are permitted to be placed in accessible locations that are compatible with permanent furniture. However, the minimum number of receptacles required by 210.52 is not permitted to be reduced and should be determined by assuming furniture is not in the room. The practical locations of that minimum number of receptacles are then determined based on the permanent furniture layout.

Hotel and motel rooms and suites are commonly used as remote offices for businesspeople who use laptop computers and other plug-in devices. In dormitories, the use of electrical/electronic equipment can be significant, necessitating accessible receptacle outlets. The *NEC* requires that two receptacle outlets be available without requiring the movement of furniture to access those receptacles. To reduce the risk of bedding material fires, receptacles located behind beds must include guards if attachment plugs could contact the bed.

Extended-stay hotels and motels are often equipped with permanent cooking equipment and countertop areas. All applicable receptacle spacing and supply requirements in 210.52 apply to guest rooms or suites that contain such provisions. A portable microwave oven is not considered to be a permanently installed cooking appliance.

Exhibit 210.30 shows a hotel guest room in which the receptacles are located based on the permanent furniture layout. Because of this

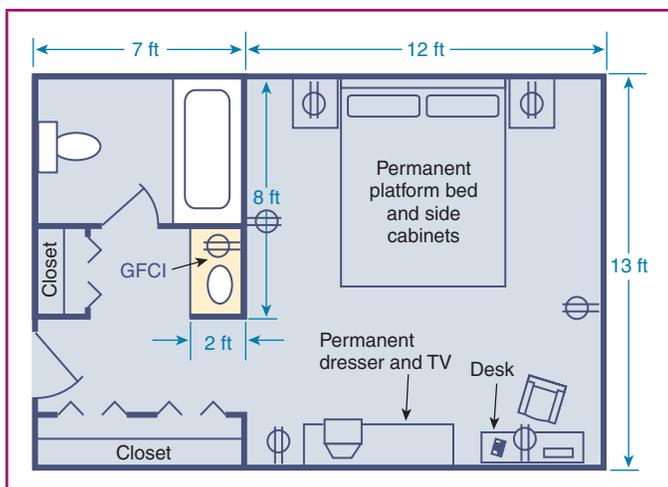

EXHIBIT 210.30 Floor plan of a hotel guest room with receptacles located with respect to permanent furniture.

rule, some spaces that are 2 feet or more in width have no receptacle outlets. However, the receptacle locations are compatible with the permanent furniture layout. In Exhibit 210.30, the receptacle outlet adjacent to the permanent dresser is needed because 210.60(B) applies only to the location of receptacle outlets, not to the minimum number of receptacle outlets.

See also

210.17 and its commentary for more information on hotel and motel guest rooms and guest suites that are equipped with permanent provisions for cooking

210.62 Show Windows. At least one 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet shall be installed within 450 mm (18 in.) of the top of a show window for each 3.7 linear m (12 linear ft) or major fraction thereof of show window area measured horizontally at its maximum width.

Some show windows extend from floor to ceiling for maximum display. To discourage floor receptacles and the use of extension cords, receptacles must be installed directly above and within 18 inches of the top of the show window, and one receptacle is required for every 12 linear feet or "major fraction thereof" (6 feet or more). This requirement requires the use of 125-volt, 15- or 20-ampere receptacles. Such a receptacle would still be required if a circuit were provided for a 24-volt lighting system.

See also

220.14(G) and 220.43(A) for information regarding load calculations for show windows

210.63 Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air-conditioning, and refrigeration equipment. The receptacle shall be located on the same level and within 7.5 m (25 ft) of the heating, air-conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means.

Informational Note: See 210.8 for ground-fault circuit-interrupter requirements.

Exception: A receptacle outlet shall not be required at one- and two-family dwellings for the service of evaporative coolers.

Requiring a permanently installed receptacle within 25 feet of heating, air-conditioning, and refrigerating equipment improves worker safety by eliminating the need to employ makeshift methods of obtaining 120-volt power for servicing and troubleshooting. The exception exempts evaporative coolers (commonly referred to as swamp coolers) from the receptacle requirement where the cooler is installed at a one- or two-family dwelling. Although this type of cooling equipment is exempt from 210.63, one- and two-family dwellings are required to have outdoor receptacle outlets at the front and the back of the structure in accordance with 210.52(E).

210.64 Electrical Service Areas. At least one 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet shall be installed in an accessible location within 7.5 m (25 ft) of the indoor

electrical service equipment. The required receptacle outlet shall be located within the same room or area as the service equipment.

Exception No. 1: The receptacle outlet shall not be required to be installed in one- and two-family dwellings.

Exception No. 2: Where the service voltage is greater than 120 volts to ground, a receptacle outlet shall not be required for services dedicated to equipment covered in Articles 675 and 682.

The required receptacle is intended to facilitate the use of portable test and diagnostic equipment that requires a 120-volt power source. The receptacle is not required in one- or two-family dwellings.

210.70 Lighting Outlets Required. Lighting outlets shall be installed where specified in 210.70(A), (B), and (C).

(A) Dwelling Units. In dwelling units, lighting outlets shall be installed in accordance with 210.70(A)(1), (A)(2), and (A)(3).

(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room, kitchen, and bathroom.

Exception No. 1: In other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets.

Exception No. 2: Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that will allow the sensor to function as a wall switch.

A receptacle outlet controlled by a wall switch is not permitted to serve as the required lighting outlet in kitchens and bathrooms. Exhibit 210.27 shows a switched receptacle supplied by a 15-ampere general-purpose branch circuit in a dining room. A switched receptacle is not considered one of the receptacle outlets required by 210.52.

Occupancy sensors are permitted to be used for switching lighting outlets in habitable rooms, kitchens, and bathrooms, provided they are equipped with a manual override or are used in addition to regular switches.

(2) Additional Locations. Additional lighting outlets shall be installed in accordance with the following:

- (1) At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power.
- (2) For dwelling units, attached garages, and detached garages with electric power, at least one wall switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade-level access. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.
- (3) Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an entryway,

to control the lighting outlet(s) where the stairway between floor levels has six risers or more.

Exception to (A)(2)(1), (A)(2)(2), and (A)(2)(3): In hallways, in stairways, and at outdoor entrances, remote, central, or automatic control of lighting shall be permitted.

Although 210.70(A)(2)(b) calls for a switched lighting outlet at outdoor entrances and exits, it does not prohibit a suitably located single lighting outlet from serving more than one door.

(4) Lighting outlets controlled in accordance with 210.70(A)(2)(3) shall not be controlled by use of dimmer switches unless they provide the full range of dimming control at each location.

(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

(B) Guest Rooms or Guest Suites. In hotels, motels, or similar occupancies, guest rooms or guest suites shall have at least one wall switch-controlled lighting outlet installed in every habitable room and bathroom.

Exception No. 1: In other than bathrooms and kitchens where provided, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets.

Exception No. 2: Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that allows the sensor to function as a wall switch.

A wall switch-controlled lighting outlet is required in every habitable room (the hotel room or rooms in a suite) and in bathrooms. Kitchens are required to have at least one lighting outlet controlled by a wall switch. Rooms other than bathrooms and kitchens may have switched receptacles to meet this lighting requirement. Exception No. 2 permits the use of occupancy sensors to control the lighting outlet, provided it is in the typical switch location and can be manually controlled.

(C) All Occupancies. For attics and underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

N 210.71 Meeting Rooms.

(A) General. Each meeting room of not more than 93 m² (1000 ft²) in other than dwelling units shall have outlets for nonlocking-type, 125-volt, 15- or 20-ampere receptacles. The

outlets shall be installed in accordance with 210.71(B). Where a room or space is provided with movable partition(s), each room size shall be determined with the partition in the position that results in the smallest size meeting room.

Informational Note No. 1: For the purposes of this section, meeting rooms are typically designed or intended for the gathering of seated occupants for such purposes as conferences, deliberations, or similar purposes, where portable electronic equipment such as computers, projectors, or similar equipment is likely to be used.

Informational Note No. 2: Examples of rooms that are not meeting rooms include auditoriums, schoolrooms, and coffee shops.

(B) Receptacle Outlets Required. The total number of receptacle outlets, including floor outlets and receptacle outlets in fixed furniture, shall not be less than as determined in (1) and (2). These receptacle outlets shall be permitted to be located as determined by the designer or building owner.

(1) Receptacle Outlets in Fixed Walls. Receptacle outlets shall be installed in accordance with 210.52(A)(1) through (A)(4).

(2) Floor Receptacle Outlets. A meeting room that is at least 3.7 m (12 ft) wide and that has a floor area of at least 20 m² (215 ft²) shall have at least one receptacle outlet located in the floor at a distance not less than 1.8 m (6 ft) from any fixed wall for each 20 m² (215 ft²) or major portion of floor space.

Informational Note No. 1: See Section 314.27(B) for floor boxes used for receptacles located in the floor.

Informational Note No. 2: See Article 518 for assembly occupancies designed for 100 or more persons.

These requirements apply to meeting rooms in a variety of occupancies, including office buildings and hotels. For most rooms in commercial buildings, there are no NEC requirements for spacing of wall and counter-top receptacles. However, this section recognizes that there is a need to provide receptacles to facilitate meetings in which attendees will be using computers. This section utilizes the same receptacle placement requirements used in dwelling units as a basis for the spacing of meeting room receptacles. In addition, larger meeting rooms require floor receptacles.

- 215.12 Identification for Feeders
 - (A) Grounded Conductor
 - (B) Equipment Grounding Conductor
 - (C) Identification of Ungrounded Conductors

215.1 Scope. This article covers the installation requirements, overcurrent protection requirements, minimum size, and ampacity of conductors for feeders.

Exception: Feeders for electrolytic cells as covered in 668.3(C)(1) and (C)(4).

215.2 Minimum Rating and Size.

(A) Feeders Not More Than 600 Volts.

(1) General. Feeder conductors shall have an ampacity not less than required to supply the load as calculated in Parts III, IV, and V of Article 220. Conductors shall be sized to carry not less than the larger of 215.2(A)(1)(a) or (b).

(a) Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum feeder conductor size shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.

The ampacity of the feeder conductors is required to be based on the larger of the continuous load (at 125 percent) plus the noncontinuous load (at 100 percent) or the maximum load to be served after any adjustments or correction factors.

Exception No. 1: If the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the feeder conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Exception No. 2: Where a portion of a feeder is connected at both its supply and load ends to separately installed pressure connections as covered in 110.14(C)(2), it shall be permitted to have an allowable ampacity not less than the sum of the continuous load plus the noncontinuous load. No portion of a feeder installed under the provisions of this exception shall extend into an enclosure containing either the feeder supply or the feeder load terminations, as covered in 110.14(C)(1).

Exception No. 2 to 215.2(A)(1)(a) addresses installations where feeders are installed in multiple segments. Feeders installed under this scenario are comprised of three segments: two segments at the terminations — supply and load — and an intervening segment. The allowable ampacity

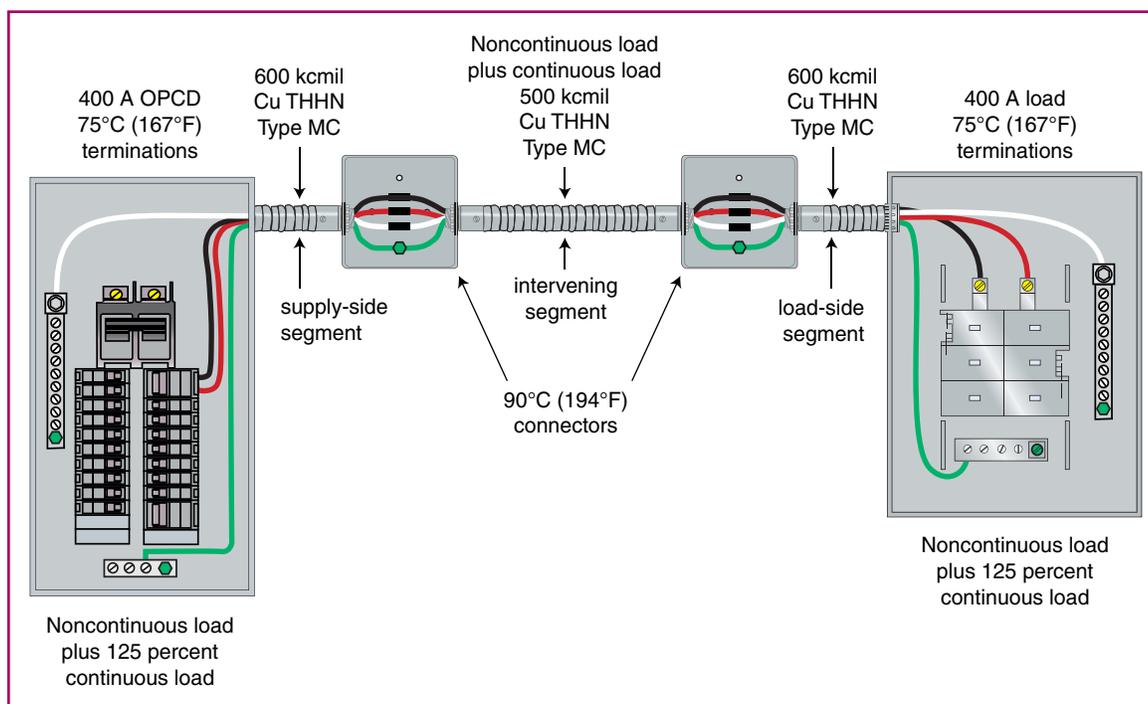

EXHIBIT 215.1
A feeder installed in accordance with 215.2(A)(1)(a) Exception No. 2.

of the intervening segment is permitted to be calculated without applying 125 percent to the continuous load.

The two segments at the terminations of the feeder are sized to accommodate the effects of continuous loading on these termination devices. Their ampacities are selected and coordinated to not exceed the lowest temperature rating of any connected termination, conductor, or device, as covered in 110.14(C)(1).

The intervening segment must terminate in enclosures at the feeder source and destination. This segment is sized in accordance with the ampacity requirements for the conductor specifically to provide wiring that will accommodate the maximum current, whether or not any portion of that current is continuous. The ampacity of this intervening segment is only limited by the ampacity parameters that apply over the length of the intervening segment and the ampacity at the listed and identified temperature rating of the pressure connector, as covered in 110.14(C)(2).

See Exhibit 215.1. A 400-ampere load is supplied by a feeder comprised of three segments. The segments at the overcurrent device and load terminate on terminals rated at 75°C and connect to the intervening load with pressure connectors rated at 90°C. A 600-kcmil, Cu THHN, Type MC cable is used at the supply and load ends. A 500-kcmil, Cu THHN, Type MC cable is used for the intervening segment.

Exception No. 3: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100 percent of the continuous and noncontinuous load.

Feeder grounded/neutral conductors that do not connect to the terminals of an overcurrent protective device are not required to be sized based on 125 percent of the continuous load. For example, if the maximum unbalanced load on a feeder neutral is calculated per 220.61 to be 200 amperes and the load is considered to be continuous, the use of a 3/0 AWG, Type THW copper conductor is permitted as long as the

conductor terminates at a neutral bus or terminal bar within the electrical distribution equipment.

(b) The minimum feeder conductor size shall have an allowable ampacity not less than the maximum load to be served after the application of any adjustment or correction factors.

Informational Note No. 1: See Examples D1 through D11 in Informative Annex D.

Informational Note No. 2: Conductors for feeders, as defined in Article 100, sized to prevent a voltage drop exceeding 3 percent at the farthest outlet of power, heating, and lighting loads, or combinations of such loads, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent, will provide reasonable efficiency of operation.

Informational Note No. 3: See 210.19(A), Informational Note No. 4, for voltage drop for branch circuits.

The informational notes covering voltage drop are not mandatory, as outlined in 90.5(C). Where circuit conductors are increased due to voltage drop, 250.122(B) requires an increase in circular mil area for the associated equipment grounding conductors.

The resistance or impedance of conductors may cause a substantial difference between voltage at service equipment and voltage at the point-of-utilization equipment. Excessive voltage drop impairs the starting and the operation of electrical equipment. Undervoltage can result in inefficient operation of heating, lighting, and motor loads. An applied voltage of 10 percent below rating can result in a decrease in efficiency of substantially more than 10 percent — for example, fluorescent light output would be reduced by 15 percent, and incandescent light output would be reduced by 30 percent. Induction motors would run hotter and produce less torque. With an applied voltage of 10 percent below rating, the running current would increase 11 percent, and the operating temperature would increase 12 percent. At the same time, torque would be reduced 19 percent.

In addition to resistance or impedance, the type of raceway or cable enclosure, the type of circuit (ac, dc, single-phase, 3-phase), and the power factor should be considered to determine voltage drop.

This basic formula can be used to determine the voltage drop in a 2-wire dc circuit, a 2-wire ac circuit, or a 3-wire ac single-phase circuit, all with a balanced load at 100 percent power factor and where reactance can be neglected:

$$VD = \frac{2 \times L \times R \times I}{1000}$$

where:

VD = voltage drop (based on conductor temperature of 75°C)

L = one-way length of circuit (ft)

R = conductor resistance in ohms (Ω) per 1000 ft (from [Chapter 9, Table 8](#))

I = load current (amperes)

For 3-phase circuits (at 100 percent power factor), the voltage drop between any two phase conductors is 0.866 times the voltage drop calculated by the preceding formula. Voltage-drop tables and calculations are available from various manufacturers.

See also

[Chapter 9, Table 9](#), and its commentary for an example of voltage-drop calculation using ac reactance and resistance

(2) Grounded Conductor. The size of the feeder circuit grounded conductor shall not be smaller than that required by [250.122](#), except that [250.122\(F\)](#) shall not apply where grounded conductors are run in parallel.

Additional minimum sizes shall be as specified in [215.2\(A\)\(3\)](#) under the conditions stipulated.

Using [250.122](#) to establish the minimum size grounded conductor in a feeder circuit provides a relationship between the grounded conductor and the feeder circuit overcurrent protective device that is the same as is used for sizing equipment grounding conductors. It provides an adequate fault current path in the event of a fault between a phase conductor and the grounded conductor. For feeder circuits installed in parallel in separate raceways or cables, the requirements of [220.61](#) and [310.10\(H\)](#) must be used to determine the minimum grounded conductor size.

See also

[215.2\(B\)](#) for sizing requirements of the grounded feeder conductor for feeder circuits over 600 volts

(3) Ampacity Relative to Service Conductors. The feeder conductor ampacity shall not be less than that of the service conductors where the feeder conductors carry the total load supplied by service conductors with an ampacity of 55 amperes or less.

According to [Table 310.15\(B\)\(16\)](#), a 3/0 AWG, Type THW copper conductor has an ampacity of 200 amperes. However, for a 3-wire, single-phase dwelling unit service, as shown in [Exhibit 215.2](#), [310.15\(B\)\(7\)](#) permits a service conductor (or a main power feeder conductor) with an ampacity of 83 percent of the service rating. This permits a minimum of 2/0 AWG, Type THW copper conductors or 4/0 AWG, Type THW aluminum conductors for services or a main power feeder rated at 200 amperes.

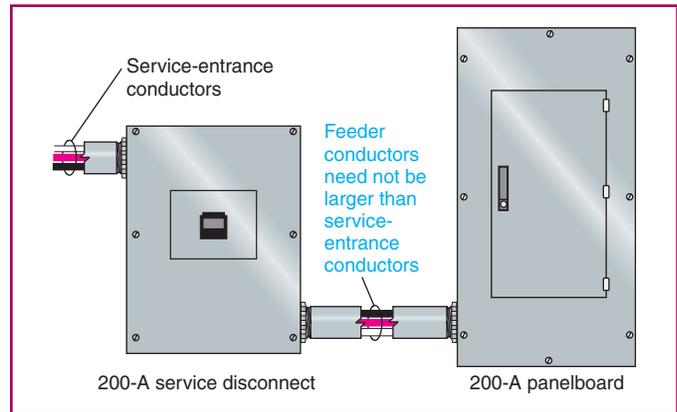

EXHIBIT 215.2 A 3-wire, single-phase dwelling service with an ampacity of 200 amperes for 2/0 AWG copper or 4/0 AWG aluminum conductors used as service-entrance conductors and feeder conductors.

(B) Feeders over 600 Volts. The ampacity of conductors shall be in accordance with [310.15](#) and [310.60](#) as applicable. Where installed, the size of the feeder-circuit grounded conductor shall not be smaller than that required by [250.122](#), except that [250.122\(F\)](#) shall not apply where grounded conductors are run in parallel. Feeder conductors over 600 volts shall be sized in accordance with [215.2\(B\)\(1\)](#), [\(B\)\(2\)](#), or [\(B\)\(3\)](#).

(1) Feeders Supplying Transformers. The ampacity of feeder conductors shall not be less than the sum of the nameplate ratings of the transformers supplied when only transformers are supplied.

(2) Feeders Supplying Transformers and Utilization Equipment. The ampacity of feeders supplying a combination of transformers and utilization equipment shall not be less than the sum of the nameplate ratings of the transformers and 125 percent of the designed potential load of the utilization equipment that will be operated simultaneously.

(3) Supervised Installations. For supervised installations, feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:

- (1) Conditions of design and installation are provided under engineering supervision.
- (2) Qualified persons with documented training and experience in over 600-volt systems provide maintenance, monitoring, and servicing of the system.

215.3 Overcurrent Protection. Feeders shall be protected against overcurrent in accordance with the provisions of [Part I of Article 240](#). Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load.

Exception No. 1: Where the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at

100 percent of its rating, the ampere rating of the overcurrent device shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Exception No. 2: Overcurrent protection for feeders between 600 and 1000 volts shall comply with *Parts I through VIII* of *Article 240*. Feeders over 1000 volts, nominal, shall comply with *Part IX* of *Article 240*.

215.4 Feeders with Common Neutral Conductor.

(A) Feeders with Common Neutral. Up to three sets of 3-wire feeders or two sets of 4-wire or 5-wire feeders shall be permitted to utilize a common neutral.

(B) In Metal Raceway or Enclosure. Where installed in a metal raceway or other metal enclosure, all conductors of all feeders using a common neutral conductor shall be enclosed within the same raceway or other enclosure as required in [300.20](#).

If ac feeder conductors, including the neutral conductor, are installed in metal raceways, the conductors are required to be grouped together to avoid induction heating of the surrounding metal. If it is necessary to run parallel conductors through multiple metal raceways, conductors from each phase plus the neutral must be run in each raceway.

See also

[250.102\(E\)](#), [250.134\(B\)](#), [300.3](#), [300.5\(I\)](#), and [300.20](#) for requirements associated with conductor grouping of feeder circuits

A 3-phase, 4-wire (208Y/120-volt, 480Y/277-volt) system is often used to supply both lighting and motor loads. The 3-phase motor loads are typically not connected to the neutral and, thus, will not cause current in the neutral conductor. The maximum current on the neutral is due to lighting loads or circuits where the neutral is used. On this type of system (3-phase, 4-wire), a demand factor of 70 percent is permitted by [220.61\(B\)](#) for that portion of the neutral load in excess of 200 amperes.

For example, if the maximum possible unbalanced load is 500 amperes, the neutral would have to be large enough to carry 410 amperes (200 amperes plus 70 percent of 300 amperes, or 410 amperes). No reduction of the neutral capacity for that portion of the load consisting of electric-discharge lighting is permitted.

[Section 310.15\(B\)\(5\)\(c\)](#) points out that a neutral conductor must be counted as a current-carrying conductor if the load it serves consists of harmonic currents. The maximum unbalanced load for feeders supplying clothes dryers, household ranges, wall-mounted ovens, and counter-mounted cooking units is required to be considered 70 percent of the load on the ungrounded conductors.

See also

[220.61\(B\)](#) for other systems in which the 70-percent demand factor may be applied

[Informative Annex D](#), [Examples D1\(a\) through D5\(b\)](#)

215.5 Diagrams of Feeders. If required by the authority having jurisdiction, a diagram showing feeder details shall be provided prior to the installation of the feeders. Such a diagram shall show the area in square feet of the building or other structure supplied by each feeder, the total calculated load before applying demand factors, the demand factors used, the calculated

load after applying demand factors, and the size and type of conductors to be used.

215.6 Feeder Equipment Grounding Conductor. Where a feeder supplies branch circuits in which equipment grounding conductors are required, the feeder shall include or provide an equipment grounding conductor in accordance with the provisions of [250.134](#), to which the equipment grounding conductors of the branch circuits shall be connected. Where the feeder supplies a separate building or structure, the requirements of [250.32\(B\)](#) shall apply.

215.7 Ungrounded Conductors Tapped from Grounded Systems. Two-wire dc circuits and ac circuits of two or more ungrounded conductors shall be permitted to be tapped from the ungrounded conductors of circuits having a grounded neutral conductor. Switching devices in each tapped circuit shall have a pole in each ungrounded conductor.

A common trip or simultaneous opening of circuit breakers or fuses is not required, but rather a switching device is required to manually disconnect the ungrounded feeder conductors.

215.9 Ground-Fault Circuit-Interrupter Protection for Personnel. Feeders supplying 15- and 20-ampere receptacle branch circuits shall be permitted to be protected by a ground-fault circuit interrupter installed in a readily accessible location in lieu of the provisions for such interrupters as specified in [210.8](#) and [590.6\(A\)](#).

GFCI protection of the feeder circuit protects all branch circuits supplied by that feeder. This type of GFCI installation is permitted in lieu of the requirements of [210.8\(A\)](#) or (B). GFCI protection in the feeder can also be used to protect construction site receptacles, as covered in [590.6\(A\)](#), provided the feeder supplies no lighting branch circuits.

Although it may be more economical or convenient to install GFCIs for feeders, consideration should be given to the possibility that a GFCI may be monitoring several branch circuits and will de-energize all branch circuits in response to a line-to-ground fault from one branch circuit.

215.10 Ground-Fault Protection of Equipment. Each feeder disconnect rated 1000 amperes or more and installed on solidly grounded wye electrical systems of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase, shall be provided with ground-fault protection of equipment in accordance with the provisions of [230.95](#).

Informational Note: For buildings that contain health care occupancies, see the requirements of [517.17](#).

Exception No. 1: The provisions of this section shall not apply to a disconnecting means for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards.

A similar requirement for ground-fault protection of services is found in [230.95](#). Prior to this requirement, there were an unusually high number

of burndowns reported on feeders and services operating in this voltage range. Solidly grounded systems operating at 480Y/277 volts were the primary focus of this requirement when it was first introduced in the NEC®, but other solidly grounded, wye-connected systems operating over 150 volts to ground and not more than 600 volts phase-to-phase are covered by this requirement. Each ground-fault protection system must be performance tested and documented according to the requirements of 230.95(C) before being put into service.

Ground-fault protection of feeder equipment is not required if protection is provided on an upstream feeder or at the service. However, additional levels of ground-fault protection for feeders may be preferred so that a single ground fault does not de-energize the whole electrical system.

See also

230.95 for further commentary on ground-fault protection of services

517.17, which requires an additional level of ground-fault protection for health care facilities

700.31 for the different ground-fault protection requirements for emergency feeders covered within the scope of **Article 700**

Exception No. 2: The provisions of this section shall not apply if ground-fault protection of equipment is provided on the supply side of the feeder and on the load side of any transformer supplying the feeder.

Ground-fault protection installed in equipment supplying the primary of a transformer will not function to protect equipment supplied by the secondary of the transformer. If the equipment supplied by the secondary of the transformer meets the parameters under which ground-fault protection of equipment (GFPE) is required by 215.10, protection must be installed to protect the equipment supplied by the secondary of the transformer.

215.11 Circuits Derived from Autotransformers. Feeders shall not be derived from autotransformers unless the system supplied has a grounded conductor that is electrically connected to a grounded conductor of the system supplying the autotransformer.

Exception No. 1: An autotransformer shall be permitted without the connection to a grounded conductor where transforming from a nominal 208 volts to a nominal 240-volt supply or similarly from 240 volts to 208 volts.

Exception No. 2: In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the installation, autotransformers shall be permitted to supply nominal 600-volt loads from nominal 480-volt systems, and 480-volt loads from nominal 600-volt systems, without the connection to a similar grounded conductor.

215.12 Identification for Feeders.

(A) Grounded Conductor. The grounded conductor of a feeder, if insulated, shall be identified in accordance with 200.6.

EXHIBIT 215.3 Different colors being used to identify each ungrounded line or phase conductor of a nominal voltage system.

(B) Equipment Grounding Conductor. The equipment grounding conductor shall be identified in accordance with 250.119.

(C) Identification of Ungrounded Conductors. Ungrounded conductors shall be identified in accordance with 215.12(C)(1) or (C)(2), as applicable.

Parallel with the requirement for ungrounded branch circuit conductors in 210.5(C), 215.12(C) requires identification of ungrounded feeder conductors by system and phase where there is more than one nominal voltage supply system to a building, structure, or other premises

For ac circuits, the identification scheme is not specified, but whatever is used is required to be consistent throughout the premises. A permanent legend or directory indicating the feeder identification system for the premises is required to be posted at each point in the distribution system from which feeder circuits are supplied, or the identification scheme is to be described in a facility log or other documentation and made readily available. Exhibit 215.3 is an example of the use of different colors to identify each ungrounded line or phase of a nominal voltage system.

(1) Feeders Supplied from More Than One Nominal Voltage System. Where the premises wiring system has feeders supplied from more than one nominal voltage system, each ungrounded conductor of a feeder shall be identified by phase or line and system at all termination, connection, and splice points in compliance with 215.12(C)(1)(a) and (b).

(a) *Means of Identification.* The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means.

(b) *Posting of Identification Means.* The method utilized for conductors originating within each feeder panelboard or similar feeder distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each feeder panelboard or similar feeder distribution equipment.

(2) Feeders Supplied from Direct-Current Systems. Where a feeder is supplied from a dc system operating at more than 60 volts, each ungrounded conductor of 4 AWG or larger shall be identified by polarity at all termination, connection, and splice points by marking tape, tagging, or other approved means; each ungrounded conductor of 6 AWG or smaller shall be identified by polarity at all termination, connection, and splice points in compliance with 215.12(C)(2)(a) and (b). The identification methods utilized for conductors originating within each feeder panelboard or similar feeder distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each feeder panelboard or similar feeder distribution equipment.

(a) *Positive Polarity, Sizes 6 AWG or Smaller.* Where the positive polarity of a dc system does not serve as the connection for the grounded conductor, each positive ungrounded conductor shall be identified by one of the following means:

- (1) A continuous red outer finish
- (2) A continuous red stripe durably marked along the conductor's entire length on insulation of a color other than green, white, gray, or black
- (3) Imprinted plus signs (+) or the word POSITIVE or POS durably marked on insulation of a color other than green, white, gray, or black, and repeated at intervals not exceeding 610 mm (24 in.) in accordance with 310.120(B)
- (4) An approved permanent marking means such as sleeving or shrink-tubing that is suitable for the conductor size, at all termination, connection, and splice points, with imprinted plus signs (+) or the word POSITIVE or POS durably marked on insulation of a color other than green, white, gray, or black

(b) *Negative Polarity, Sizes 6 AWG or Smaller.* Where the negative polarity of a dc system does not serve as the connection for the grounded conductor, each negative ungrounded conductor shall be identified by one of the following means:

- (1) A continuous black outer finish
- (2) A continuous black stripe durably marked along the conductor's entire length on insulation of a color other than green, white, gray, or red
- (3) Imprinted minus signs (–) or the word NEGATIVE or NEG durably marked on insulation of a color other than green, white, gray, or red, and repeated at intervals not exceeding 610 mm (24 in.) in accordance with 310.120(B)
- (4) An approved permanent marking means such as sleeving or shrink-tubing that is suitable for the conductor size, at all termination, connection, and splice points, with imprinted minus signs (–) or the word NEGATIVE or NEG durably marked on insulation of a color other than green, white, gray, or red

For dc circuits, there are similar requirements for posting the method of identification at panelboards and similar distribution points. For conductors

6 AWG and smaller, marking requirements for the ungrounded conductor are based on which conductor of the circuit is grounded. White, green, and gray are prohibited colors for ungrounded conductors to prevent confusion with grounded and equipment grounding conductors of ac circuits.

methods for branch-circuit loads. **Parts III and IV** provide calculation methods for feeder and service loads. **Part V** provides calculation methods for farm loads.

Informational Note No. 1: See examples in **Informative Annex D**.

Informational Note No. 2: See **Figure 220.1** for information on the organization of **Article 220**.

Although this article does not contain the requirements for determining the minimum number of branch circuits the loads calculated in accordance with **Article 220** are used in conjunction with the rules of **210.11** to determine how many branch circuits are needed at a premises.

220.3 Other Articles for Specific-Purpose Calculations. **Table 220.3** shall provide references for specific-purpose calculation requirements not located in **Chapters 5, 6, or 7** that amend or supplement the requirements of this article.

220.5 Calculations.

(A) Voltages. Unless other voltages are specified, for purposes of calculating branch-circuit and feeder loads, nominal system voltages of 120, 120/240, 208Y/120, 240, 347, 480Y/277, 480, 600Y/347, and 600 volts shall be used.

(B) Fractions of an Ampere. Calculations shall be permitted to be rounded to the nearest whole ampere, with decimal fractions smaller than 0.5 dropped.

For uniform calculation of load, nominal voltages, as listed in **220.5(A)**, are required to be used in computing the ampere load on the conductors. To select conductor sizes, refer to **310.15**.

Loads are calculated on the basis of volt-amperes (VA) or kilovolt-amperes (kVA), rather than watts or kilowatts (kW), to calculate the true

Part I. General

220.1 Scope. This article provides requirements for calculating branch-circuit, feeder, and service loads. **Part I** provides general requirements for calculation methods. **Part II** provides calculation

TABLE 220.3 *Specific-Purpose Calculation References*

Calculation	Article	Section (or Part)
Air-conditioning and refrigerating equipment, branch-circuit conductor sizing	440	Part IV
Fixed electric heating equipment for pipelines and vessels, branch-circuit sizing	427	427.4
Fixed electric space-heating equipment, branch-circuit sizing	424	424.3
Fixed outdoor electric deicing and snow-melting equipment, branch-circuit sizing	426	426.4
Motors, feeder demand factor	430	430.26
Motors, multimotor and combination-load equipment	430	430.25
Motors, several motors or a motor(s) and other load(s)	430	430.24
Over 600-volt branch-circuit calculations	210	210.19(B)
Over 600-volt feeder calculations	215	215.2(B)
Phase converters, conductors	455	455.6
Storage-type water heaters	422	422.11(E)

ampere values. However, the rating of equipment is given in watts or kilowatts for resistive loads. Such ratings are considered to be the equivalent of the same rating in volt-amperes or kilovolt-amperes. This concept recognizes that load calculations determine conductor and circuit sizes, that the power factor of the load is often unknown, and that the conductor “sees” the circuit volt-amperes only, not the circuit power (watts).

See also

Informative Annex D for examples

Part II. Branch-Circuit Load Calculations

220.10 General. Branch-circuit loads shall be calculated as shown in 220.12, 220.14, and 220.16.

220.12 Lighting Load for Specified Occupancies. A unit load of not less than that specified in Table 220.12 for occupancies specified shall constitute the minimum lighting load. The floor area for each floor shall be calculated from the outside dimensions of the building, dwelling unit, or other area involved. For dwelling units, the calculated floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use.

Informational Note: The unit values are based on minimum load conditions and 100 percent power factor and may not provide sufficient capacity for the installation contemplated.

Exception No. 1: Where the building is designed and constructed to comply with an energy code adopted by the local

authority, the lighting load shall be permitted to be calculated at the values specified in the energy code where the following conditions are met:

- (1) A power monitoring system is installed that will provide continuous information regarding the total general lighting load of the building.
- (2) The power monitoring system will be set with alarm values to alert the building owner or manager if the lighting load exceeds the values set by the energy code.
- (3) The demand factors specified in 220.42 are not applied to the general lighting load.

Exception No. 2: Where a building is designed and constructed to comply with an energy code adopted by the local authority

TABLE 220.12 *General Lighting Loads by Occupancy*

Type of Occupancy	Unit Load	
	Volt-amperes/m ²	Volt-amperes/ft ²
Armories and auditoriums	11	1
Banks	39 ^b	3½ ^b
Barber shops and beauty parlors	33	3
Churches	11	1
Clubs	22	2
Courtrooms	22	2
Dwelling units ^a	33	3
Garages — commercial (storage)	6	¼
Hospitals	22	2
Hotels and motels, including apartment houses without provision for cooking by tenants ^a	22	2
Industrial commercial (loft) buildings	22	2
Lodge rooms	17	1½
Office buildings	39 ^b	3½ ^b
Restaurants	22	2
Schools	33	3
Stores	33	3
Warehouses (storage)	3	¼
In any of the preceding occupancies except one-family dwellings and individual dwelling units of two-family and multifamily dwellings:		
Assembly halls and auditoriums	11	1
Halls, corridors, closets, stairways	6	½
Storage spaces	3	¼

^aSee 220.14(J).

^bSee 220.14(K).

and specifying an overall lighting density of less than 13.5 volt-amperes/13.5 m² (1.2 volt-amperes/1.2 ft²), the unit lighting loads in Table 220.12 for office and bank areas within the building shall be permitted to be reduced by 11 volt-amperes/11 m² (1 volt-amperes/1 ft²).

General lighting loads are in fact minimum lighting loads. The two exceptions permit the lighting load of a building to be calculated in accordance with the energy code adopted in the jurisdiction with limitations.

The limitations in Exception No. 1 include the need for continuous monitoring of the lighting load and an alarm that is set to alert the building owner or manager if the load exceeds the values laid out in the energy code. The demand factors may not be applied on top of this reduced lighting load.

When an office or bank is designed using an energy code, the minimum required illumination level is reached at a lower specified power density. Although the minimum illumination level is not dictated by the NEC®, minimum lighting load calculations are. Exception No. 2 allows a decrease in the NEC lighting unit load if an energy code has been used for the design of the building's lighting system.

220.14 Other Loads — All Occupancies. In all occupancies, the minimum load for each outlet for general-use receptacles and outlets not used for general illumination shall not be less than that calculated in 220.14(A) through (L), the loads shown being based on nominal branch-circuit voltages.

Exception: The loads of outlets serving switchboards and switching frames in telephone exchanges shall be waived from the calculations.

(A) Specific Appliances or Loads. An outlet for a specific appliance or other load not covered in 220.14(B) through (L) shall be calculated based on the ampere rating of the appliance or load served.

(B) Electric Dryers and Electric Cooking Appliances in Dwellings and Household Cooking Appliances Used in Instructional Programs. Load calculations shall be permitted as specified in 220.54 for electric dryers and in 220.55 for electric ranges and other cooking appliances.

Culinary school programs often use multiple household ranges rather than more costly commercial cooking equipment. These appliances tend to use less energy than those used in some commercial kitchens.

(C) Motor Outlets. Loads for motor outlets shall be calculated in accordance with the requirements in 430.22, 430.24, and 440.6.

(D) Luminaires. An outlet supplying luminaire(s) shall be calculated based on the maximum volt-ampere rating of the equipment and lamps for which the luminaire(s) is rated.

Where the rating of the luminaires installed for general lighting exceeds the minimum load provided for in Table 220.12, the minimum general lighting load for that premises must be based on the installed luminaires. In general, no additional calculation is required for luminaires (recessed

and surface mounted) installed in or on a dwelling unit, because the load of such luminaires is covered in the 3 volt-amperes per square foot calculation specified by Table 220.12.

(E) Heavy-Duty Lampholders. Outlets for heavy-duty lampholders shall be calculated at a minimum of 600 volt-amperes.

(F) Sign and Outline Lighting. Sign and outline lighting outlets shall be calculated at a minimum of 1200 volt-amperes for each required branch circuit specified in 600.5(A).

The load calculation must be based on a minimum of 1200 volt-amperes or the actual load of the sign and outline lighting outlets, whichever is greater.

(G) Show Windows. Show windows shall be calculated in accordance with either of the following:

- (1) The unit load per outlet as required in other provisions of this section
- (2) At 200 volt-amperes per linear 300 mm (1 ft) of show window

As shown in Exhibit 220.1, the linear-foot calculation method is permitted in lieu of the specified unit load per outlet for branch circuits serving show windows.

(H) Fixed Multioutlet Assemblies. Fixed multioutlet assemblies used in other than dwelling units or the guest rooms or guest suites of hotels or motels shall be calculated in accordance with (H)(1) or (H)(2). For the purposes of this section, the calculation shall be permitted to be based on the portion that contains receptacle outlets.

- (1) Where appliances are unlikely to be used simultaneously, each 1.5 m (5 ft) or fraction thereof of each separate and continuous length shall be considered as one outlet of not less than 180 volt-amperes.

EXHIBIT 220.1 An example of the volt-ampere per linear-foot load calculation for branch circuits serving a show window. (iStockPhoto)

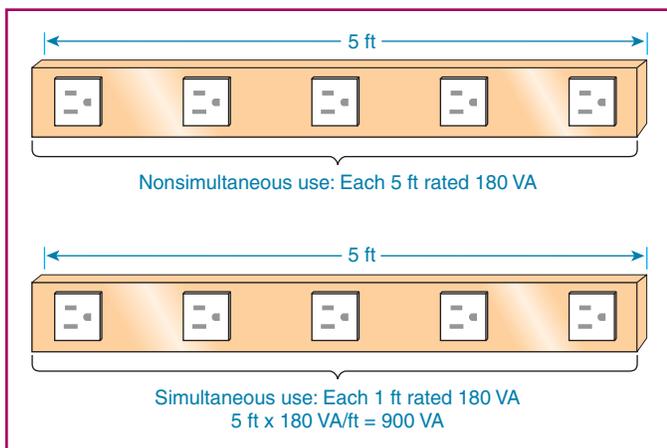

EXHIBIT 220.2 The requirements of 220.14(H)(1) and (H)(2) as applied to fixed multioutlet assemblies.

- (2) Where appliances are likely to be used simultaneously, each 300 mm (1 ft) or fraction thereof shall be considered as an outlet of not less than 180 volt-amperes.

In light-use commercial and industrial applications, not all of the cord-connected equipment is expected to be used at the same time. An example of light use is a workbench area where one worker uses one electrical tool at a time. In heavy-use applications, all of the cord-connected equipment is generally operating at the same time. An example of heavy use is a retail store displaying television sets, where most or all sets are operating simultaneously. Exhibit 220.2 illustrates the difference between 220.14(H)(1) and (H)(2).

See also

220.44 for demand factors that apply to the load calculation in 220.14(H) and (I)

(I) Receptacle Outlets. Except as covered in 220.14(J) and (K), receptacle outlets shall be calculated at not less than 180 volt-amperes for each single or for each multiple receptacle on one yoke. A single piece of equipment consisting of a multiple receptacle comprised of four or more receptacles shall be calculated at not less than 90 volt-amperes per receptacle. This provision shall not be applicable to the receptacle outlets specified in 210.11(C)(1) and (C)(2).

Section 220.44 contains demand factors that apply to the load calculation in 220.14(H) and (I). The general receptacle load in one- and

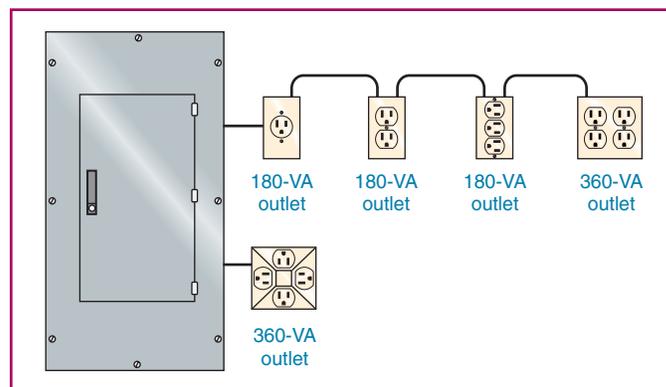

EXHIBIT 220.3 The load requirement of 180 volt-amperes per 220.14(I) applied to single- and multiple-receptacle outlets on single straps and the load of 360 volt-amperes applied to a multiple device consisting of four receptacles.

two-family and multifamily dwellings and in guest rooms of hotels and motels is included in the general lighting load value assigned by Table 220.12. The load requirements for the laundry and small-appliance branch circuits are 1500 volt-amperes per circuit, as described in 220.52.

Exhibit 220.3 shows the load of 180 volt-amperes applied to single and multiple receptacles mounted on a single yoke or strap, and the load of 360 volt-amperes applied to the outlet containing two duplex receptacles and to the outlet containing the device with four receptacles. Note that the last outlet of the top circuit consists of two duplex receptacles on separate straps. The multiple receptacle supplied from the bottom circuit in the exhibit is comprised of four receptacles. For example, single-strap and multiple-receptacle devices are calculated as follows:

Device	Calculated Load
Duplex receptacle	180 VA
Triplex receptacle	180 VA
Double duplex receptacle	360 VA (180 × 2)
Quadplex-type receptacle	360 VA (90 × 4)

In Exhibit 220.4, the maximum number of receptacle outlets permitted on 15- and 20-ampere branch circuits is 10 and 13 outlets, respectively, based on the load assigned for each outlet by 220.14(I). This restriction does not apply to receptacle outlets in dwelling occupancies.

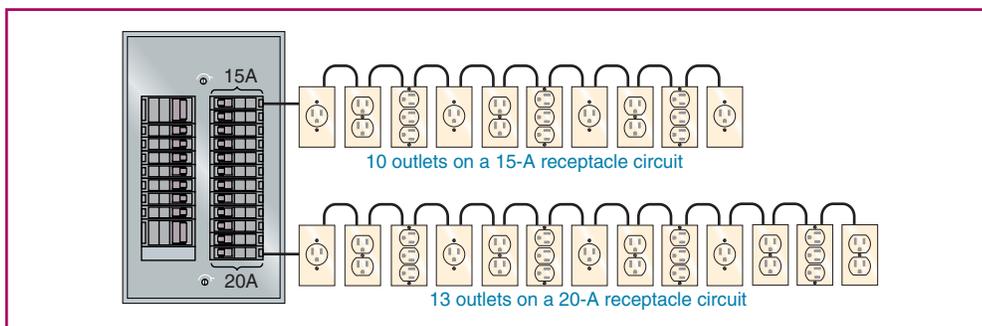

EXHIBIT 220.4 Maximum number of receptacle outlets permitted on 15- and 20-ampere branch circuits.

(J) Dwelling Occupancies. In one-family, two-family, and multifamily dwellings and in guest rooms or guest suites of hotels and motels, the outlets specified in (J)(1), (J)(2), and (J)(3) are included in the general lighting load calculations of 220.12. No additional load calculations shall be required for such outlets.

- (1) All general-use receptacle outlets of 20-ampere rating or less, including receptacles connected to the circuits in 210.11(C)(3)
- (2) The receptacle outlets specified in 210.52(E) and (G)
- (3) The lighting outlets specified in 210.70(A) and (B)

(K) Banks and Office Buildings. In banks or office buildings, the receptacle loads shall be calculated to be the larger of (1) or (2):

- (1) The calculated load from 220.14(I)
- (2) 11 volt-amperes/m² or 1 volt-ampere/ft²

(L) Other Outlets. Other outlets not covered in 220.14(A) through (K) shall be calculated based on 180 volt-amperes per outlet.

220.16 Loads for Additions to Existing Installations.

(A) Dwelling Units. Loads added to an existing dwelling unit(s) shall comply with the following as applicable:

- (1) Loads for structural additions to an existing dwelling unit or for a previously unwired portion of an existing dwelling unit, either of which exceeds 46.5 m² (500 ft²), shall be calculated in accordance with 220.12 and 220.14.
- (2) Loads for new circuits or extended circuits in previously wired dwelling units shall be calculated in accordance with either 220.12 or 220.14, as applicable.

(B) Other Than Dwelling Units. Loads for new circuits or extended circuits in other than dwelling units shall be calculated in accordance with either 220.12 or 220.14, as applicable.

220.18 Maximum Loads. The total load shall not exceed the rating of the branch circuit, and it shall not exceed the maximum loads specified in 220.18(A) through (C) under the conditions specified therein.

(A) Motor-Operated and Combination Loads. Where a circuit supplies only motor-operated loads, Article 430 shall apply. Where a circuit supplies only air-conditioning equipment, refrigerating equipment, or both, Article 440 shall apply. For circuits supplying loads consisting of motor-operated utilization equipment that is fastened in place and has a motor larger than ½ hp in combination with other loads, the total calculated load shall be based on 125 percent of the largest motor load plus the sum of the other loads.

(B) Inductive and LED Lighting Loads. For circuits supplying lighting units that have ballasts, transformers, autotransformers, or LED drivers, the calculated load shall be based on

the total ampere ratings of such units and not on the total watts of the lamps.

(C) Range Loads. It shall be permissible to apply demand factors for range loads in accordance with Table 220.55, including Note 4.

Part III. Feeder and Service Load Calculations

220.40 General. The calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits supplied, as determined by Part II of this article, after any applicable demand factors permitted by Part III or IV or required by Part V have been applied.

Informational Note: See Examples D1(a) through D10 in Informative Annex D. See 220.18(B) for the maximum load in amperes permitted for lighting units operating at less than 100 percent power factor.

In the example shown in Exhibit 220.5, each panelboard supplies a calculated load of 80 amperes. The main set of service conductors is sized to carry the total calculated load of 240 amperes (3 × 80 A). The service conductors from the meter enclosure to each panelboard [2 AWG Cu = 95 A per 60°C column of Table 310.15(B)(16)] are sized to supply a calculated load of 80 amperes and to meet the requirement of 230.90 relative to overcurrent (overload) protection of service conductors terminating in a single-service overcurrent protective device. The main set of service conductors [250 kcmil THWN Cu = 255 A per 75°C column of Table 310.15(B)(16)] is not required to be sized to carry 300 amperes based on the combined rating of the panelboards. The individual service-entrance conductors to each panelboard (2 AWG THWN) meet the requirement of 230.90.

See Exhibit 230.26 for a similar example. In that example, the ungrounded service conductors are not required to be sized for the sum of the main overcurrent device ratings of 350 amperes. Service conductors are required to have sufficient ampacity to carry the loads calculated in accordance with Article 220, with the appropriate demand factors applied.

See also

230.23, 230.31, and 230.42 for specifics on size and rating of service conductors

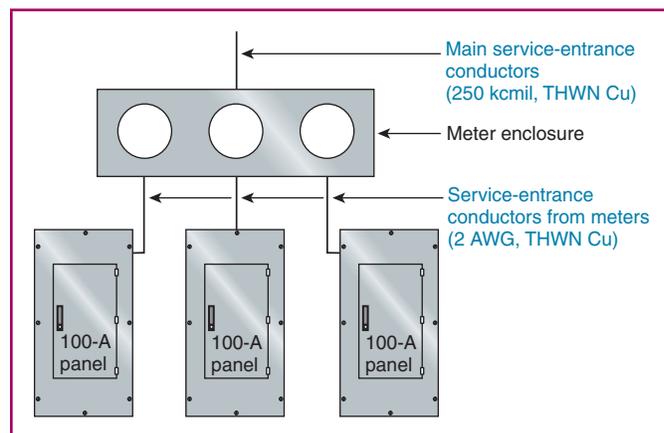

EXHIBIT 220.5 Service conductors sized in accordance with 220.40.

220.42 General Lighting. The demand factors specified in Table 220.42 shall apply to that portion of the total branch-circuit load calculated for general illumination. They shall not be applied in determining the number of branch circuits for general illumination.

TABLE 220.42 Lighting Load Demand Factors

Type of Occupancy	Portion of Lighting Load to Which Demand Factor Applies (Volt-Amperes)	Demand Factor (%)
Dwelling units	First 3000 at	100
	From 3001 to 120,000 at	35
	Remainder over 120,000 at	25
Hospitals*	First 50,000 or less at	40
	Remainder over 50,000 at	20
Hotels and motels, including apartment houses without provision for cooking by tenants*	First 20,000 or less at	50
	From 20,001 to 100,000 at	40
	Remainder over 100,000 at	30
Warehouses (storage)	First 12,500 or less at	100
	Remainder over 12,500 at	50
All others	Total volt-amperes	100

*The demand factors of this table shall not apply to the calculated load of feeders or services supplying areas in hospitals, hotels, and motels where the entire lighting is likely to be used at one time, as in operating rooms, ballrooms, or dining rooms.

220.43 Show-Window and Track Lighting.

(A) Show Windows. For show-window lighting, a load of not less than 660 volt-amperes/linear meter or 200 volt-amperes/linear foot shall be included for a show window, measured horizontally along its base.

Informational Note: See 220.14(G) for branch circuits supplying show windows.

(B) Track Lighting. For track lighting in other than dwelling units or guest rooms or guest suites of hotels or motels, an additional load of 150 volt-amperes shall be included for every 600 mm (2 ft) of lighting track or fraction thereof. Where multicircuit track is installed, the load shall be considered to be divided equally between the track circuits.

Calculation Example

A lighting plan shows 63 linear feet of single-circuit track lighting for a small clothing store. Because the actual track lighting fixtures are owner supplied, neither the quantity of track lighting fixtures nor

the lamp size is specified. What is the minimum calculated load associated with the track lighting that must be added to the service or feeder supplying this store?

Solution

According to 220.43(B), the minimum calculated load to be added to the service or feeder supplying this track light installation is calculated as follows:

$$\frac{63 \text{ ft}}{2 \text{ ft}} = 31.50, \text{ rounded up to } 32$$

$$32 \times 150 \text{ VA} = 4800 \text{ VA}$$

It is important to note that the branch circuits supplying this installation are covered in 410.151(B). The maximum load on the track must not exceed the rating of the branch circuit supplying the track. Also, the track must be supplied by a branch circuit that has a rating not exceeding the rating of the track.

Section 220.43(B) is not intended to limit the number of feet of track on a single branch circuit, nor is it intended to limit the number of fixtures on an individual track. It is meant to be used solely for load calculations of feeders and services.

Exception: If the track lighting is supplied through a device that limits the current to the track, the load shall be permitted to be calculated based on the rating of the device used to limit the current.

The rating of the branch-circuit overcurrent protective device can be used for this calculation, or the device used to limit current can be a supplementary overcurrent protective device. This exception enables load calculations to be more in line with the limitations placed on building lighting loads by energy codes.

Calculation Example

A lighting plan shows 63 linear feet of single-circuit track lighting for a small clothing store. Because the actual track lighting fixtures are owner supplied, neither the quantity of track lighting fixtures nor the lamp size is specified in the plan. Because the amount of track is to facilitate easy relocation of the luminaires to accommodate changes in the display of merchandise rather than to accommodate a large number of luminaires, the entire length will be supplied by a single 20-A, 120-V branch circuit. What is the minimum calculated load associated with the track lighting that must be added to the service or feeder supplying this store?

Solution

According to the exception to 220.43(B), the minimum calculated load to be added to the service or feeder supplying this track light installation is calculated as follows:

$$20 \text{ A} \times 120 \text{ V} = 2400 \text{ VA}$$

This calculation could be further reduced where the track is supplied through a supplementary overcurrent protective device(s) having a current rating less than 20 A.

220.44 Receptacle Loads — Other Than Dwelling Units.

Receptacle loads calculated in accordance with 220.14(H) and (I) shall be permitted to be made subject to the demand factors given in Table 220.42 or Table 220.44.

TABLE 220.44 Demand Factors for Non-Dwelling Receptacle Loads

Portion of Receptacle Load to Which Demand Factor Applies (Volt-Amperes)	Demand Factor (%)
First 10 kVA or less at	100
Remainder over 10 kVA at	50

Receptacle loads are permitted to be calculated by either of the following methods:

1. The receptacle loads are added to the lighting load. The demand factors (if applicable) in Table 220.42 are then applied to the combined load.
2. The receptacle loads are calculated (without the lighting load) with demand factors from Table 220.44 applied.

These demand factors do not apply to receptacle load calculated based on 220.14(K)(1).

220.50 Motors. Motor loads shall be calculated in accordance with 430.24, 430.25, and 430.26 and with 440.6 for hermetic refrigerant motor-compressors.

220.51 Fixed Electric Space Heating. Fixed electric space-heating loads shall be calculated at 100 percent of the total connected load. However, in no case shall a feeder or service load current rating be less than the rating of the largest branch circuit supplied.

Exception: Where reduced loading of the conductors results from units operating on duty-cycle, intermittently, or from all units not operating at the same time, the authority having jurisdiction may grant permission for feeder and service conductors to have an ampacity less than 100 percent, provided the conductors have an ampacity for the load so determined.

220.52 Small-Appliance and Laundry Loads — Dwelling Unit.

(A) Small-Appliance Circuit Load. In each dwelling unit, the load shall be calculated at 1500 volt-amperes for each 2-wire small-appliance branch circuit as covered by 210.11(C)(1). Where the load is subdivided through two or more feeders, the calculated

load for each shall include not less than 1500 volt-amperes for each 2-wire small-appliance branch circuit. These loads shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 220.42.

Exception: The individual branch circuit permitted by 210.52(B)(1), Exception No. 2, shall be permitted to be excluded from the calculation required by 220.52.

(B) Laundry Circuit Load. A load of not less than 1500 volt-amperes shall be included for each 2-wire laundry branch circuit installed as covered by 210.11(C)(2). This load shall be permitted to be included with the general lighting load and shall be subjected to the demand factors provided in Table 220.42.

Where additional small-appliance and laundry branch circuits are provided, they also are calculated at 1500 volt-amperes per circuit. These loads are permitted to be totaled and then added to the general lighting load. The demand factors in Table 220.42 can then be applied to the combined total load of the small-appliance branch circuits, the laundry branch circuit, and the general lighting from Table 220.12.

220.53 Appliance Load — Dwelling Unit(s). It shall be permissible to apply a demand factor of 75 percent to the nameplate rating load of four or more appliances fastened in place, other than electric ranges, clothes dryers, space-heating equipment, or air-conditioning equipment, that are served by the same feeder or service in a one-family, two-family, or multifamily dwelling.

For appliances fastened in place (other than ranges, clothes dryers and space-heating and air-conditioning equipment), feeder capacity must be provided for the sum of these loads. If the total load includes four or more such appliances, a demand factor of 75 percent is permitted.

See also

Table 430.248 for the full-load current, in amperes, for single-phase ac motors in accordance with 220.50

220.54 Electric Clothes Dryers — Dwelling Unit(s). The load for household electric clothes dryers in a dwelling unit(s) shall be either 5000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. The use of the demand factors in Table 220.54 shall be permitted. Where two or more single-phase dryers are supplied by a 3-phase, 4-wire feeder or service, the total load shall be calculated on the basis of twice the maximum number connected between any two phases. Kilovolt-amperes (kVA) shall be considered equivalent to kilowatts (kW) for loads calculated in this section.

TABLE 220.54 Demand Factors for Household Electric Clothes Dryers

Number of Dryers	Demand Factor (%)
1–4	100
5	85
6	75
7	65
8	60
9	55
10	50
11	47
12–23	47% minus 1% for each dryer exceeding 11
24–42	35% minus 0.5% for each dryer exceeding 23
43 and over	25%

The use of demand factors is permitted but not required, because the *NEC* does not prohibit applying the full load of all dryers to a service and/or feeder calculation. However, this method is not necessary or practical, and experience has demonstrated that the use of the [Table 220.54](#) demand factors provides sufficient capacity in the service for dryer loads. It is unlikely that all dryers will be in operation simultaneously, and [Table 220.54](#) was developed based on utility demand that proves this point.

The minimum load to be used is the larger of either 5000 volt-amperes or the nameplate rating of the dryer. In the following calculation example, the nameplate rating of 5500 watts (VA) is used. In addition, because of the supply system characteristics, calculation is a little different from simply adding the total rating of all dryers and applying the appropriate demand factor. The load of 10 single-phase dryers will be distributed across a 3 phase supply system

Calculation Example

Assuming the load of 10 single-phase dryers is connected as evenly as possible to the 3-phase system (3 dryers connected between phases A and B, 3 dryers connected between phases B and C, and 4 dryers connected between phases A and C), the maximum number of dryers connected between any two phases is 4.

Solution

Step 1. Twice the maximum number of dryers connected between any two phases is used as the basis for calculating the demand load:

$$4 \text{ dryers} \times 2 = 8 \text{ dryers}$$

60% demand from [Table 220.54](#):

$$5500 \text{ VA} \times 8 \times 0.6 = 26,400 \text{ VA}$$

(connected between two phases of the 3-phase system)

$$26,400 \text{ VA} \div 2 = 13,200 \text{ VA per phase load}$$

3-phase dryer load on service:

$$13,200 \text{ VA} \times 3 = 39,600 \text{ VA}$$

Dryer load on each of the ungrounded service or feeder conductors:

$$39,600 \text{ VA} \div (208 \text{ V} \times 1.732) = 110 \text{ A}$$

Step 2. For the grounded (neutral) service or feeder conductor, [220.61\(B\)\(1\)](#) permits a 70-percent demand to be applied to the demand load of the ungrounded conductors. However, since this is a 3-phase feeder, [220.61\(C\)\(1\)](#) prohibits the application of the demand factor on the neutral conductor load.

If the service and feeder load for this multifamily dwelling is calculated using the optional calculation for multifamily dwellings from [Part IV](#) of [Article 220](#), the dryer load is not subject to an individual demand factor as required by the [Part III](#) calculation. The total connected load is subjected to a single demand factor from [Table 220.84](#) based on the total number of dwelling units served by a set of service or feeder conductors. For a set of conductors serving 10 dwelling units, the demand factor is 43 percent.

The optional calculation can be used if all of the conditions specified in [220.84\(A\)\(1\)](#) through (A)(3) are met. Otherwise, the calculation for the multifamily dwelling must be performed in accordance with the requirements of [Part III](#) of [Article 220](#).

220.55 Electric Cooking Appliances in Dwelling Units and Household Cooking Appliances Used in Instructional Programs. The load for household electric ranges, wall-mounted ovens, counter-mounted cooking units, and other household cooking appliances individually rated in excess of 1¾ kW shall be permitted to be calculated in accordance with [Table 220.55](#). Kilovolt-amperes (kVA) shall be considered equivalent to kilowatts (kW) for loads calculated under this section.

Where two or more single-phase ranges are supplied by a 3-phase, 4-wire feeder or service, the total load shall be calculated on the basis of twice the maximum number connected between any two phases.

Informational Note No. 1: See the examples in [Informative Annex D](#).

Informational Note No. 2: See [Table 220.56](#) for commercial cooking equipment.

TABLE 220.55 Demand Factors and Loads for Household Electric Ranges, Wall-Mounted Ovens, Counter-Mounted Cooking Units, and Other Household Cooking Appliances over 1¼ kW Rating (Column C to be used in all cases except as otherwise permitted in Note 3.)

Number of Appliances	Demand Factor (%) (See Notes)		Column C Maximum Demand (kW) (See Notes) (Not over 12 kW Rating)
	Column A (Less than 3½ kW Rating)	Column B (3½ kW through 8¾ kW Rating)	
1	80	80	8
2	75	65	11
3	70	55	14
4	66	50	17
5	62	45	20
6	59	43	21
7	56	40	22
8	53	36	23
9	51	35	24
10	49	34	25
11	47	32	26
12	45	32	27
13	43	32	28
14	41	32	29
15	40	32	30
16	39	28	31
17	38	28	32
18	37	28	33
19	36	28	34
20	35	28	35
21	34	26	36
22	33	26	37
23	32	26	38
24	31	26	39
25	30	26	40
26–30	30	24	
31–40	30	22	15 kW + 1 kW for each range
41–50	30	20	
51–60	30	18	25 kW + ¾ kW for each range
61 and over	30	16	

Notes:

- Over 12 kW through 27 kW ranges all of same rating. For ranges individually rated more than 12 kW but not more than 27 kW, the maximum demand in Column C shall be increased 5 percent for each additional kilowatt of rating or major fraction thereof by which the rating of individual ranges exceeds 12 kW.
- Over 8¾ kW through 27 kW ranges of unequal ratings. For ranges individually rated more than 8¾ kW and of different ratings, but none exceeding 27 kW, an average value of rating shall be calculated by adding together the ratings of all ranges to obtain the total connected load (using 12 kW for any range rated less than 12 kW) and dividing by the total number of ranges. Then the maximum demand in Column C shall be increased 5 percent for each kilowatt or major fraction thereof by which this average value exceeds 12 kW.
- Over 1¼ kW through 8¾ kW. In lieu of the method provided in Column C, it shall be permissible to add the nameplate ratings of all household cooking appliances rated more than 1¼ kW but not more than 8¾ kW and multiply the sum by the demand factors specified in Column A or Column B for the given number of appliances. Where the rating of cooking appliances falls under both Column A and Column B, the demand factors for each column shall be applied to the appliances for that column, and the results added together.
- Branch-Circuit Load. It shall be permissible to calculate the branch-circuit load for one range in accordance with Table 220.55. The branch-circuit load for one wall-mounted oven or one counter-mounted cooking unit shall be the nameplate rating of the appliance. The branch-circuit load for a counter-mounted cooking unit and not more than two wall-mounted ovens, all supplied from a single branch circuit and located in the same room, shall be calculated by adding the nameplate rating of the individual appliances and treating this total as equivalent to one range.
- This table shall also apply to household cooking appliances rated over 1¼ kW and used in instructional programs.

The demand factors are based on the diversified use of household appliances, because it is unlikely that all appliances will be used simultaneously or that all cooking units and the oven of a range will be at maximum heat for any length of time.

The values in Column C are applicable to installations where all ranges in the group have the same rating. Note 1 applies where the ranges are rated greater than 12 kilowatts and Note 2 applies where the ranges in a group have different ratings. Column C must be used unless Note 3 is applicable. Notes 3 and 4 cover installations where the circuit supplies multiple cooking components, which are combined and treated as a single range.

Table Note 1: For household electric ranges, the size of the conductors must be determined by the rating of the range. According to [Table 220.55](#), for one range rated 12 kilowatts or less, the maximum demand load is 8 kilowatts. Note that [210.19\(A\)\(3\)](#) does not permit the branch-circuit rating of a circuit supplying household ranges with a nameplate rating of 8¾ kilowatts to be less than 40 amperes.

The demand in Column C must be increased if an individual range is rated over 12 kilowatts but less than 27 kilowatts. All ranges in the group must have the same rating to apply Note 1. If the ratings are different, refer to Note 2.

Calculation Example

Determine the maximum demand for 4 ranges each rated at 15 kW.

Solution

Step 1. Determine amount of rating above 12 kW: $15 \text{ kW} - 12 \text{ kW} = 3 \text{ kW}$

Step 2. Calculate the required demand increase: $5\% \text{ per kW} \times 3 \text{ kW} = 15\%$

Step 3. Calculate the maximum demand: 17 kW (Column C demand value for 4 ranges) $\times 115\% = 19.55 \text{ kW}$

Table Note 2. If ranges in a group installation have different ratings between 8¾ kW to 27 kW, the ratings are added together to determine the average rating and the maximum demand. The demand in Column C must be increased if the average rating is over 12 kW. If the ratings are the same, refer to Note 1.

Calculation Example

Determine the maximum demand for 4 ranges rated at 8 kW, 10 kW, 15 kW, and 18 kW, respectively.

Solution

Step 1. Total the range ratings: 12 kW (minimum value for 8 kW range) $+ 12 \text{ kW}$ (minimum value for 10 kW range) $+ 15 \text{ kW} + 18 \text{ kW} = 57 \text{ kW}$

Step 2. Calculate the average rating: $57 \text{ kW} \div 4 \text{ ranges} = 14.25 \text{ kW}$

Step 3. Determine amount of rating above 12 kW: $14.25 \text{ kW} - 12 \text{ kW} = 2.25 \text{ kW}$

Step 4. Calculate the required demand increase: $5\% \text{ per kW} \times 2 \text{ kW}$ (0.25 kW is not a major fraction) $= 10\%$

Step 5. Calculate the maximum demand: 17 kW (Column C demand value for 4 ranges) $\times 110\% = 18.7 \text{ kW}$

Table Note 3. For a group installation of ranges with ratings between 1¾ kilowatts through 8¾ kilowatts, the ratings are permitted to be added together for determining a demand factor. Ranges rated below 3½ kilowatts should be grouped independently of those rated 3½ kilowatts and above. The appropriate column (A or B) is used rather than Column C.

Calculation Example

Determine the maximum demand for 4 ranges rated at 4.5 kW, 5 kW, 5 kW, and 8.5 kW, respectively.

Solution

Step 1. Combine ratings into single value: $4.5 \text{ kW} + 5 \text{ kW} + 5 \text{ kW} + 8.5 \text{ kW} = 23 \text{ kW}$

Step 2. Determine demand factor: 50% (Column B, 4 ranges)

Step 3. Calculate the maximum demand: $23 \text{ kW} \times 50\% = 11.5 \text{ kW}$

Table Note 4. The branch-circuit load for one range is permitted to be computed by using either the nameplate rating of the appliance or [Table 220.55](#). Counter-mounted cooking appliances have a smaller load rating than that of a full-sized range with an oven. If a single branch circuit supplies a counter-mounted cooking unit and not more than two wall-mounted ovens, all of which are located in the same room, the nameplate ratings of these appliances can be added and the total treated as the equivalent of one range. For feeder demand factors for other than dwelling units, that is, commercial electric cooking equipment, dishwasher booster heaters, water heaters, and so forth, see [Table 220.56](#).

Where counter-mounted cooking appliances like the one pictured in [Exhibit 220.6](#) are used with a separate wall oven, it is permissible to run a single branch circuit to the kitchen and supply each with branch-circuit tap conductors installed as specified in [210.19\(A\)\(3\) Exception No. 1](#).

Calculation Example

Calculate the load for a single branch circuit that supplies:

- One counter-mounted cooking unit with rating of 8 kW
- One wall-mounted oven with rating of 7 kW
- A second wall-mounted oven with rating of 6 kW

Solution

Step 1. Combine the ratings of the cooking appliances.

$$8 \text{ kW} + 7 \text{ kW} + 6 \text{ kW} = 21 \text{ kW}$$

Step 2. Determine amount of rating above 12 kW (see [Table 220.55](#), Note 1).

$$21 \text{ kW} - 12 \text{ kW} = 9 \text{ kW}$$

Step 3. Calculate the demand increase required by [Table 220.55](#), Note 1.

$$5\% \text{ per kW} \times 9 \text{ kW} = 45\%$$

Step 4. Calculate the maximum demand:

$$8 \text{ kW (Column C demand value for single range)} \\ \times 145\% = 11.6 \text{ kW} = 11.6 \text{ VA}$$

Step 5. Calculate the branch circuit load.

$$\text{Branch circuit load} = \frac{11,600 \text{ VA}}{240 \text{ V}} = 48.3 \text{ or } 48 \text{ A}$$

EXHIBIT 220.6 A counter-mounted cooking appliance installed in a dwelling-unit kitchen. (© Linea/Dreamstime.com)

220.56 Kitchen Equipment — Other Than Dwelling Unit(s).

It shall be permissible to calculate the load for commercial electric cooking equipment, dishwasher booster heaters, water heaters, and other kitchen equipment in accordance with [Table 220.56](#). These demand factors shall be applied to all equipment that has either thermostatic control or intermittent use as kitchen equipment. These demand factors shall not apply to space-heating, ventilating, or air-conditioning equipment.

However, in no case shall the feeder or service calculated load be less than the sum of the largest two kitchen equipment loads.

TABLE 220.56 Demand Factors for Kitchen Equipment — Other Than Dwelling Unit(s)

Number of Units of Equipment	Demand Factor (%)
1	100
2	100
3	90
4	80
5	70
6 and over	65

The demand factors in [Table 220.56](#) can be applied to a combination of cooking, dishwashing, water heating, and other type commercial kitchen appliances, and the combined total allows a deeper demand factor to be applied. Thermostatically controlled electric cooking appliances such as the one shown in [Exhibit 220.7](#) are permitted, but not required, to have the demand applied to the appliance nameplate rating.

Commercial electric cooking appliances are used more intensively and for longer periods, thus the demand factors for commercial applications are not as generous as those permitted for dwelling units. The applications of the demand factors of [220.55](#) are permitted to be used for household cooking equipment used in instructional programs, such

EXHIBIT 220.7 Electrically powered cooking/heating appliance with thermostatic control in a commercial kitchen. (Courtesy of the International Association of Electrical Inspectors)

as in culinary schools, because this equipment is not subjected to the continuous demands that would exist in a commercial restaurant.

[220.14\(B\)](#) and its commentary for more information

220.60 Noncoincident Loads. Where it is unlikely that two or more noncoincident loads will be in use simultaneously, it shall be permissible to use only the largest load(s) that will be used at one time for calculating the total load of a feeder or service.

220.61 Feeder or Service Neutral Load.

(A) Basic Calculation. The feeder or service neutral load shall be the maximum unbalance of the load determined by this article. The maximum unbalanced load shall be the maximum net calculated load between the neutral conductor and any one ungrounded conductor.

Exception: For 3-wire, 2-phase or 5-wire, 2-phase systems, the maximum unbalanced load shall be the maximum net calculated load between the neutral conductor and any one ungrounded conductor multiplied by 140 percent.

(B) Permitted Reductions. A service or feeder supplying the following loads shall be permitted to have an additional demand factor of 70 percent applied to the amount in [220.61\(B\)\(1\)](#) or portion of the amount in [220.61\(B\)\(2\)](#) determined by the following basic calculations:

- (1) A feeder or service supplying household electric ranges, wall-mounted ovens, counter-mounted cooking units, and electric dryers, where the maximum unbalanced load has been determined in accordance with [Table 220.55](#) for ranges and [Table 220.54](#) for dryers

- (2) That portion of the unbalanced load in excess of 200 amperes where the feeder or service is supplied from a 3-wire dc or single-phase ac system; or a 4-wire, 3-phase system; or a 3-wire, 2-phase system; or a 5-wire, 2-phase system

Informational Note: See **Examples D1(a), D1(b), D2(b), D4(a), and D5(a)** in **Informative Annex D**.

(C) Prohibited Reductions. There shall be no reduction of the neutral or grounded conductor capacity applied to the amount in **220.61(C)(1)**, or portion of the amount in **(C)(2)**, from that determined by the basic calculation:

- (1) Any portion of a 3-wire circuit consisting of 2 ungrounded conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system
- (2) That portion consisting of nonlinear loads supplied from a 4-wire, wye-connected, 3-phase system

Informational Note: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic neutral conductor currents.

Section 220.61 describes the basis for calculating the neutral load of feeders or services as the maximum unbalanced load that can occur between the neutral and any other ungrounded conductor. For a household electric range or clothes dryer, the maximum unbalanced load for a single-phase feeder or service may be assumed to be 70 percent, so the neutral can be sized on that basis. If the unbalanced load exceeds 200 amperes, **Section 220.61(B)** permits the reduction of the feeder neutral conductor size under specific conditions of use. However, **220.61(C)(1)** and **(C)(2)** cite a circuit arrangement and a load characteristic as applications where the capacity of a neutral or grounded conductor of a feeder or service is not permitted to be reduced.

The neutral is considered a current-carrying conductor if the load of the electric-discharge lighting, data-processing, or similar equipment on the feeder neutral consists of more than half the total load, in accordance with **310.15(B)(5)(c)**. Electric-discharge lighting and data-processing equipment may have harmonic currents in the neutral that may exceed the load current in the ungrounded conductors. The Informational Note to item 2 cautions designers and installers to be aware of harmonic contribution and to design the electrical installation to accommodate the harmonic load imposed on neutral conductors. In some instances, the neutral current may exceed the current in the phase conductors.

Part IV. Optional Feeder and Service Load Calculations

220.80 General. Optional feeder and service load calculations shall be permitted in accordance with **Part IV**.

220.82 Dwelling Unit.

(A) Feeder and Service Load. This section applies to a dwelling unit having the total connected load served by a single

120/240-volt or 208Y/120-volt set of 3-wire service or feeder conductors with an ampacity of 100 or greater. It shall be permissible to calculate the feeder and service loads in accordance with this section instead of the method specified in **Part III** of this article. The calculated load shall be the result of adding the loads from **220.82(B)** and **(C)**. Feeder and service-entrance conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by **220.61**.

This optional calculation method applies to a single dwelling unit, whether it is a separate building or located in a multifamily dwelling. See **Article 100** for the definition of *dwelling unit*.

See also

Informative Annex D, Examples D2(a), D2(b), D2(c), and D4(b), for examples of the optional calculation for a dwelling unit

(B) General Loads. The general calculated load shall be not less than 100 percent of the first 10 kVA plus 40 percent of the remainder of the following loads:

- (1) 33 volt-amperes/m² or 3 volt-amperes/ft² for general lighting and general-use receptacles. The floor area for each floor shall be calculated from the outside dimensions of the dwelling unit. The calculated floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use.
- (2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit covered in **210.11(C)(1)** and **(C)(2)**.
- (3) The nameplate rating of the following:
 - a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit
 - b. Ranges, wall-mounted ovens, counter-mounted cooking units
 - c. Clothes dryers that are not connected to the laundry branch circuit specified in item (2)
 - d. Water heaters
- (4) The nameplate ampere or kVA rating of all permanently connected motors not included in item (3).

(C) Heating and Air-Conditioning Load. The largest of the following six selections (load in kVA) shall be included:

- (1) 100 percent of the nameplate rating(s) of the air conditioning and cooling.
- (2) 100 percent of the nameplate rating(s) of the heat pump when the heat pump is used without any supplemental electric heating.
- (3) 100 percent of the nameplate rating(s) of the heat pump compressor and 65 percent of the supplemental electric heating for central electric space-heating systems. If the heat pump compressor is prevented from operating at the same time as the supplementary heat, it does not need to be added to the supplementary heat for the total central space heating load.

If the heat pump compressor and supplemental heating can operate at the same time, 100 percent of the compressor load plus 65 percent of the supplemental heating load is treated as the central space heating load. If the equipment operates such that the compressor cannot operate concurrently with the supplemental heating, the central space heating load is required to be based on only 65 percent of the supplemental heating load.

- (4) 65 percent of the nameplate rating(s) of electric space heating if less than four separately controlled units.
- (5) 40 percent of the nameplate rating(s) of electric space heating if four or more separately controlled units.
- (6) 100 percent of the nameplate ratings of electric thermal storage and other heating systems where the usual load is expected to be continuous at the full nameplate value. Systems qualifying under this selection shall not be calculated under any other selection in 220.82(C).

Section 220.82(C) requires that only the largest of the six choices needs to be included in the feeder or service calculation.

See also

Informative Annex D, Examples D2(a), D2(b), and D2(c), for examples of calculations using air conditioning and heating

220.83 Existing Dwelling Unit. This section shall be permitted to be used to determine if the existing service or feeder is of sufficient capacity to serve additional loads. Where the dwelling unit is served by a 120/240-volt or 208Y/120-volt, 3-wire service, it shall be permissible to calculate the total load in accordance with 220.83(A) or (B).

(A) Where Additional Air-Conditioning Equipment or Electric Space-Heating Equipment Is Not to Be Installed. The following percentages shall be used for existing and additional new loads.

Load (kVA)	Percent of Load
First 8 kVA of load at	100
Remainder of load at	40

Load calculations shall include the following:

- (1) General lighting and general-use receptacles at 33 volt-amperes/m² or 3 volt-amperes/ft² as determined by 220.12
- (2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit covered in 210.11(C)(1) and (C)(2)
- (3) The nameplate rating of the following:
 - a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit
 - b. Ranges, wall-mounted ovens, counter-mounted cooking units
 - c. Clothes dryers that are not connected to the laundry branch circuit specified in item (2)
 - d. Water heaters

(B) Where Additional Air-Conditioning Equipment or Electric Space-Heating Equipment Is to Be Installed. The following percentages shall be used for existing and additional new loads. The larger connected load of air conditioning or space heating, but not both, shall be used.

Load	Percent of Load
Air-conditioning equipment	100
Central electric space heating	100
Less than four separately controlled space-heating units	100
First 8 kVA of all other loads	100
Remainder of all other loads	40

Other loads shall include the following:

- (1) General lighting and general-use receptacles at 33 volt-amperes/m² or 3 volt-amperes/ft² as determined by 220.12
- (2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit covered in 210.11(C)(1) and (C)(2)
- (3) The nameplate rating of the following:
 - a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit
 - b. Ranges, wall-mounted ovens, counter-mounted cooking units
 - c. Clothes dryers that are not connected to the laundry branch circuit specified in item (2)
 - d. Water heaters

The optional methods described in 220.83(A) and (B) allow an additional load to be supplied by an existing service.

Calculation Example 1

220.83(A). An existing dwelling unit is served by a 100-A service. A 20 ft × 20 ft addition with a second additional laundry room is to be added to the dwelling. Determine if the service is properly sized to handle the increased load.

Solution

Step 1. Following the requirements of 220.83(A), calculate the existing dwelling unit load before the addition:

General lighting:	
24 ft × 40 ft = 960 ft ² × 3 VA per ft ²	2,880 VA
Small-appliance circuits: 3 × 1500 VA	4,500 VA
Laundry circuit	1,500 VA
Electric range rated 10.5 kW	10,500 VA
Electric water heater rated 3.0 kW	3,000 VA
Total existing load	22,380 VA

Step 2. Determine new loads of the dwelling unit.

Added 20 ft × 20 ft floor area (400 ft ² × 3 VA per ft ²)	1,200 VA
Added laundry circuit	1,500 VA
Total new load	2,700 VA

Step 3. Following the requirements in 220.83(A), calculate the dwelling unit total load after the new addition:

First 8 kVA of other load at 100%	8,000 VA
Remainder of other load at 40%:	
$22,380 \text{ VA} + 2700 \text{ VA} - 8000 \text{ VA} = 17,080 \text{ VA} \times 40\%$	<u>6,832 VA</u>
Total load	14,832 VA

Step 4. Determine if service is properly rated to handle additional load:

$$14,832 \text{ VA} \div 240 \text{ V} = 61.8 \text{ or } 62 \text{ A}$$

The additional load contributed by the added floor space with a laundry room does not exceed the allowable load permitted on a 100-A service.

Calculation Example 2

220.83(B). In addition to the added floor area and laundry circuit, a single 5-kVA, 240-V air-conditioning unit is to be installed. Determine if the service is properly sized to handle the increased load.

Solution

Step 1. Determine existing load. Total existing load = 22,380 VA from Step 1 of Calculation Example 1 above.

Step 2. Determine new loads of the dwelling unit.

Added 20 ft × 20 ft floor area (400 ft ² × 3 VA per ft ²)	1,200 VA
Added laundry circuit	1,500 VA
Added air-conditioning unit	5,000 VA

Step 3. Following the requirements in 220.83(B), calculate the dwelling unit total load after the new addition and equipment

100% of added air-conditioning equipment	5,000 VA
First 8 kVA of other load at 100%	8,000 VA
Remainder of other load at 40%:	
$22,380 \text{ VA} + 2,700 \text{ VA} - 8,000 \text{ VA} = 17,080 \text{ VA} \times 40\%$	<u>6,832 VA</u>
Total load	19,832 VA

Step 4. Determine if service is properly rated to handle additional load:

$$19,832 \text{ VA} \div 240 \text{ V} = 82.6 \text{ or } 83 \text{ A}$$

The additional load contributed by the added floor space with a laundry room and 5-kVA air-conditioning equipment does not exceed the allowable load permitted on a 100-A service.

220.84 Multifamily Dwelling.

(A) Feeder or Service Load. It shall be permissible to calculate the load of a feeder or service that supplies three or more dwelling units of a multifamily dwelling in accordance with Table 220.84 instead of Part III of this article if all the following conditions are met:

- (1) No dwelling unit is supplied by more than one feeder.
- (2) Each dwelling unit is equipped with electric cooking equipment.

Exception: When the calculated load for multifamily dwellings without electric cooking in Part III of this article exceeds that calculated under Part IV for the identical load plus electric cooking (based on 8 kW per unit), the lesser of the two loads shall be permitted to be used.

This calculation method is only permitted for dwelling units with electric cooking equipment. The exception permits load calculation for dwelling units that do not have electric cooking equipment by adding an artificial electric cooking equipment load of 8 kW per unit to the load calculated in accordance with Part IV and comparing this calculated load to the load for the dwellings without electric cooking equipment calculated in accordance with Part III of Article 220 (commonly referred to as the “standard calculation”).

- (3) Each dwelling unit is equipped with either electric space heating or air conditioning, or both. Feeders and service conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 220.61.

(B) House Loads. House loads shall be calculated in accordance with Part III of this article and shall be in addition to the dwelling unit loads calculated in accordance with Table 220.84.

(C) Calculated Loads. The calculated load to which the demand factors of Table 220.84 apply shall include the following:

- (1) 33 volt-amperes/m² or 3 volt-amperes/ft² for general lighting and general-use receptacles

TABLE 220.84 Optional Calculations — Demand Factors for Three or More Multifamily Dwelling Units

Number of Dwelling Units	Demand Factor (%)
3–5	45
6–7	44
8–10	43
11	42
12–13	41
14–15	40
16–17	39
18–20	38
21	37
22–23	36
24–25	35
26–27	34
28–30	33
31	32
32–33	31
34–36	30
37–38	29
39–42	28
43–45	27
46–50	26
51–55	25
56–61	24
62 and over	23

- (2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit covered in 210.11(C)(1) and (C)(2)
- (3) The nameplate rating of the following:
 - a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit
 - b. Ranges, wall-mounted ovens, counter-mounted cooking units
 - c. Clothes dryers that are not connected to the laundry branch circuit specified in item (2)
 - d. Water heaters
- (4) The nameplate ampere or kVA rating of all permanently connected motors not included in item (3)
- (5) The larger of the air-conditioning load or the fixed electric space-heating load

220.85 Two Dwelling Units. Where two dwelling units are supplied by a single feeder and the calculated load under Part III of this article exceeds that for three identical units calculated under 220.84, the lesser of the two loads shall be permitted to be used.

220.86 Schools. The calculation of a feeder or service load for schools shall be permitted in accordance with Table 220.86 in lieu of Part III of this article where equipped with electric space heating, air conditioning, or both. The connected load to which the demand factors of Table 220.86 apply shall include all of the interior and exterior lighting, power, water heating, cooking, other loads, and the larger of the air-conditioning load or space-heating load within the building or structure.

Feeders and service conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 220.61. Where the building or structure load is calculated by this optional method, feeders within the building or structure shall have ampacity as permitted in Part III of this article; however, the ampacity of an individual feeder shall not be required to be larger than the ampacity for the entire building.

This section shall not apply to portable classroom buildings.

TABLE 220.86 *Optional Method — Demand Factors for Feeders and Service Conductors for Schools*

Connected Load	Demand Factor (Percent)
First 33 VA/m ² (3 VA/ft ²) at Plus,	100
Over 33 through 220 VA/m ² (3 through 20 VA/ft ²) at Plus,	75
Remainder over 220 VA/m ² (20 VA/ft ²) at	25

The air-conditioning load in portable classrooms must comply with Article 440, and the lighting load must be considered continuous. The demand factors in Table 220.86 do not apply to portable classrooms,

because those demand factors would decrease the feeder or service size to below that required for the connected continuous load.

Table 220.86 provides a series of demand increments that are permitted to be applied to the initial calculated load for service or feeder conductors supplying the total load of a school building in lieu of the “standard calculation” covered in Part III of Article 220. The incremental steps of Table 220.86 are based on more significant reductions of the total load as the load per square foot increases. Any portion of the load exceeding 20 volt-ampere per square foot is permitted to have a 25-percent demand factor applied. This approach is similar in concept to that applied to dwellings in Table 220.42, except that the demands in Table 220.86 apply to the entire load of the building, not just the general lighting load.

Feeder conductors that do not supply the entire load of the building or structure are to be calculated in accordance with Part III of Article 220. Feeder conductors supplying subdivided building loads are not required to be larger than the service or feeder conductors that supply the entire building or structure load.

Calculation Example

Calculate the demand load for a 100,000 ft² school building if the calculated load without demand factors is 2.5 MVA (2,500,000 VA).

Solution

Step 1. Determine load per square foot.

$$2.5 \text{ MVA} / 100,000 \text{ ft}^2 = 25 \text{ VA/ft}^2$$

Step 2. Calculate the demand load using Table 220.86.

First 3 VA/ft ² at 100%	3 VA/ft ²
Next 17 VA/ft ² at 75%	
17 VA/ft ² × 0.75	12.75 VA/ft ²
Remaining 5 VA/ft ² at 25%	
5 VA/ft ² × 0.25	1.25 VA/ft ²
Overall demand factor	17 VA/ft ²

Step 3. Calculate demand load for the school:

$$17 \text{ VA/ft}^2 \times 100,000 \text{ ft}^2 = 1,700,000 \text{ VA} = 1.7 \text{ MVA}$$

220.87 Determining Existing Loads. The calculation of a feeder or service load for existing installations shall be permitted to use actual maximum demand to determine the existing load under all of the following conditions:

- (1) The maximum demand data is available for a 1-year period.

Exception: If the maximum demand data for a 1-year period is not available, the calculated load shall be permitted to be based on the maximum demand (the highest average kilowatts reached and maintained for a 15-minute interval) continuously recorded over a minimum 30-day period using a recording ammeter or power meter connected to the highest loaded phase of the feeder or service, based on the initial loading at the start of the recording. The recording shall reflect the maximum demand of the feeder or service by being taken when the building or space

TABLE 220.88 *Optional Method — Permitted Load Calculations for Service and Feeder Conductors for New Restaurants*

Total Connected Load (kVA)	All Electric Restaurant Calculated Loads (kVA)	Not All Electric Restaurant Calculated Loads (kVA)
0–200	80%	100%
201–325	10% (amount over 200) + 160.0	50% (amount over 200) + 200.0
326–800	50% (amount over 325) + 172.5	45% (amount over 325) + 262.5
Over 800	50% (amount over 800) + 410.0	20% (amount over 800) + 476.3

Note: Add all electrical loads, including both heating and cooling loads, to calculate the total connected load. Select the one demand factor that applies from the table, then multiply the total connected load by this single demand factor.

is occupied and shall include by measurement or calculation the larger of the heating or cooling equipment load, and other loads that may be periodic in nature due to seasonal or similar conditions.

- (2) The maximum demand at 125 percent plus the new load does not exceed the ampacity of the feeder or rating of the service.
- (3) The feeder has overcurrent protection in accordance with **240.4**, and the service has overload protection in accordance with **230.90**.

220.88 New Restaurants. Calculation of a service or feeder load, where the feeder serves the total load, for a new restaurant shall be permitted in accordance with **Table 220.88** in lieu of **Part III** of this article

The overload protection of the service conductors shall be in accordance with **230.90** and **240.4**.

Feeder conductors shall not be required to be of greater ampacity than the service conductors.

Service or feeder conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by **220.61**.

The demand factors in **220.88** recognize the effects of load diversity that are typical of restaurants. It also recognizes the amount of continuous loads as a percentage of the total connected load.

The National Restaurant Association, the Edison Electric Institute, and the Electric Power Research Institute based the data for **220.88** on load studies of 262 restaurants. These studies showed that the demand factors were lower for restaurants with larger connected loads. The service or feeder size is calculated by applying the appropriate demand factor from **Table 220.88** to the total load kVA.

Calculation Example 1

A new, all-electric restaurant has a total connected load of 348 kVA at 208Y/120 V. Calculate the demand load using **Table 220.88**. Then determine the size of the service-entrance conductors and the maximum-size overcurrent device for the service.

Solution

Step 1. Calculate the demand load using the value in **Table 220.88** (Row 3, Column 2).

$$\begin{aligned} \text{Demand load} &= 50\% \text{ of amount over } 325 \text{ kVA} + 172.5 \text{ kVA} \\ &= (0.50 \times (348 \text{ kVA} - 325 \text{ kVA})) + 172.5 \text{ kVA} \\ &= 184 \text{ kVA}_{\text{Demand load}} \end{aligned}$$

Step 2. Calculate the service size.

$$\begin{aligned} \text{Service size} &= \frac{\text{kVA}_{\text{Demand load}} \times 1000}{\text{voltage} \sqrt{3}} \\ &= \frac{184 \text{ kVA} \times 1000}{208 \text{ V} \times \sqrt{3}} \\ &= 510.7 \text{ or } 511 \text{ A} \end{aligned}$$

Step 3. Determine the size of the overcurrent device. The next higher standard-size overcurrent device permitted by **240.4(B)** is 600 A.

Step 4. Determine minimum conductor size from **Table 310.15(B)(16)**. The minimum copper conductor size using the 75°C column is a single 900 AWG (allowable ampacity 520 A). Parallel conductors, such as two 300 kcmil copper conductors (allowable ampacity 285 A × 2), may also be used.

Calculation Example 2

A new restaurant has gas cooking appliances plus a total connected electrical load of 348 kVA at 208Y/120 V. Calculate the demand load using **Table 220.88**. Then determine the size of the service entrance conductors and the maximum-size overcurrent device for the service.

Solution

Step 1. Calculate the demand load using the value in **Table 220.88** (Row 3, Column 3):

$$\begin{aligned} \text{Demand load} &= 45\% \text{ of amount over } 325 \text{ kVA} + 262.5 \text{ kVA} \\ &= (0.45 \times (348 \text{ kVA} - 325 \text{ kVA})) + 262.5 \text{ kVA} \\ &= 272.85 \text{ kVA}_{\text{Demand load}} \end{aligned}$$

Step 2. Calculate the service size.

$$\begin{aligned} \text{Service size} &= \frac{\text{kVA}_{\text{Demand load}} \times 1000}{\text{voltage} \sqrt{3}} \\ &= \frac{272.85 \text{ kVA} \times 1000}{208 \text{ V} \times \sqrt{3}} \\ &= 757.36 \text{ or } 757 \text{ A} \end{aligned}$$

Step 3. Determine the size of the overcurrent device. The next higher standard-size overcurrent device permitted by 240.6(B) is 800 A.

Step 4. Determine minimum conductor size from Table 310.15(B)(16). The required conductor ampacity is above those provided on the table for a single conductor. Parallel conductors, such as two 500 kcmil copper conductors (allowable ampacity 285 A × 2), are necessary.

Part V. Farm Load Calculations

220.100 General. Farm loads shall be calculated in accordance with Part V.

220.102 Farm Loads — Buildings and Other Loads.

(A) Dwelling Unit. The feeder or service load of a farm dwelling unit shall be calculated in accordance with the provisions for dwellings in Part III or IV of this article. Where the dwelling has electric heat and the farm has electric grain-drying systems, Part IV of this article shall not be used to calculate the dwelling load where the dwelling and farm loads are supplied by a common service.

(B) Other Than Dwelling Unit. Where a feeder or service supplies a farm building or other load having two or more separate branch circuits, the load for feeders, service conductors, and service equipment shall be calculated in accordance with demand factors not less than indicated in Table 220.102.

TABLE 220.102 Method for Calculating Farm Loads for Other Than Dwelling Unit

Ampere Load at 240 Volts Maximum	Demand Factor (%)
The greater of the following: All loads that are expected to operate simultaneously, or 125 percent of the full load current of the largest motor, or First 60 amperes of the load	100
Next 60 amperes of all other loads Remainder of other loads	50 25

220.103 Farm Loads — Total. Where supplied by a common service, the total load of the farm for service conductors and service equipment shall be calculated in accordance with the farm dwelling unit load and demand factors specified in Table 220.103.

Where there is equipment in two or more farm equipment buildings or for loads having the same function, such loads shall be calculated in accordance with Table 220.102 and shall be permitted to be combined as a single load in Table 220.103 for calculating the total load.

TABLE 220.103 Method for Calculating Total Farm Load

Individual Loads Calculated in Accordance with Table 220.102	Demand Factor (%)
Largest load	100
Second largest load	75
Third largest load	65
Remaining loads	50

Note: To this total load, add the load of the farm dwelling unit calculated in accordance with Part III or IV of this article. Where the dwelling has electric heat and the farm has electric grain-drying systems, Part IV of this article shall not be used to calculate the dwelling load.

225.1 Scope. This article covers requirements for outside branch circuits and feeders run on or between buildings, structures, or poles on the premises; and electrical equipment and wiring for the supply of utilization equipment that is located on or attached to the outside of buildings, structures, or poles.

Informational Note: For additional information on wiring over 1000 volts, see ANSI/IEEE C2-2012, *National Electrical Safety Code*.

Article 225 provides requirements unique to the installation of feeders and branch circuits outside (overhead and underground) of buildings and structures. These circuits may be supplying specific items of electrical equipment, or they may be the power supply to another building or structure. Examples of outside feeders and branch circuits include the following:

- Conductors supplying the buildings of a multibuilding industrial complex or institutional campus
- Outdoor supply conductors from an emergency system, standby system, an alternative energy system, or on-site power generation
- Supply conductors between a dwelling unit and detached garage or other structure

These requirements are in addition to the general requirements for branch circuits and feeders in Articles 210 and 215.

225.3 Other Articles. Application of other articles, including additional requirements to specific cases of equipment and conductors, is shown in Table 225.3.

TABLE 225.3 Other Articles

Equipment/Conductors	Article
Branch circuits	210
Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits	725
Communications circuits	800
Community antenna television and radio distribution systems	820
Conductors for general wiring	310
Electrically driven or controlled irrigation machines	675
Electric signs and outline lighting	600
Feeders	215
Fire alarm systems	760
Fixed outdoor electric deicing and snow-melting equipment	426
Floating buildings	553
Grounding and bonding	250
Hazardous (classified) locations	500
Hazardous (classified) locations — specific	510
Marinas and boatyards	555
Messenger-supported wiring	396
Mobile homes, manufactured homes, and mobile home parks	550
Open wiring on insulators	398
Over 1000 volts, general	490
Overcurrent protection	240
Radio and television equipment	810
Services	230
Solar photovoltaic systems	690
Swimming pools, fountains, and similar installations	680
Use and identification of grounded conductors	200

Part I. General

225.4 Conductor Covering. Where within 3.0 m (10 ft) of any building or structure other than supporting poles or towers, open individual (aerial) overhead conductors shall be insulated for the nominal voltage. The insulation of conductors in cables or raceways, except Type MI cable, shall be of thermoset or thermoplastic type and, in wet locations, shall comply with 310.10(C). The insulation of conductors for festoon lighting shall be of the rubber-covered or thermoplastic type.

Exception: Equipment grounding conductors and grounded circuit conductors shall be permitted to be bare or covered as specifically permitted elsewhere in this Code.

This exception and 250.184(A)(1), Exception No. 2, correlate to permit the use of the bare messenger wire of an overhead cable assembly as the grounded (neutral) conductor of an outdoor feeder circuit.

225.5 Size of Conductors 600 Volts, Nominal, or Less. The ampacity of outdoor branch-circuit and feeder conductors shall be in accordance with 310.15 based on loads as determined under 220.10 and Part III of Article 220.

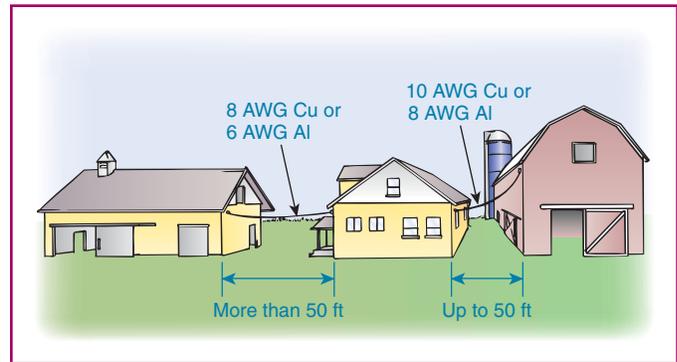

EXHIBIT 225.1 Minimum sizes of conductors in overhead spans for 1000 volts, nominal, or less.

225.6 Conductor Size and Support.

(A) Overhead Spans. Open individual conductors shall not be smaller than the following:

- (1) For 1000 volts, nominal, or less, 10 AWG copper or 8 AWG aluminum for spans up to 15 m (50 ft) in length, and 8 AWG copper or 6 AWG aluminum for a longer span unless supported by a messenger wire
- (2) For over 1000 volts, nominal, 6 AWG copper or 4 AWG aluminum where open individual conductors, and 8 AWG copper or 6 AWG aluminum where in cable

The size limitation of copper and aluminum conductors for overhead spans is based on the need for adequate mechanical strength to support the weight of the conductors and to withstand wind, ice, and other similar conditions. Exhibit 225.1 illustrates overhead spans that are not messenger supported, that are run between buildings, and that are 1000 volts or less. The messenger cable provides the necessary mechanical strength rather than relying on the conductors.

See also

396.10 for cable types permitted to be messenger supported

(B) Festoon Lighting. Overhead conductors for festoon lighting shall not be smaller than 12 AWG unless the conductors are supported by messenger wires. In all spans exceeding 12 m (40 ft), the conductors shall be supported by messenger wire. The messenger wire shall be supported by strain insulators. Conductors or messenger wires shall not be attached to any fire escape, downspout, or plumbing equipment.

Article 100 defines *festoon lighting* as “a string of outdoor lights that is suspended between two points.” Exhibit 225.2 illustrates an installation of festoon lighting that complies with the minimum clearance above-grade requirement specified in 225.18(1). The maximum distance between conductor supports is 40 feet unless a messenger wire is installed to support the current-carrying conductors.

Attachment of festoon lighting to fire escapes, plumbing equipment, or metal drain spouts is prohibited, because the attachment could

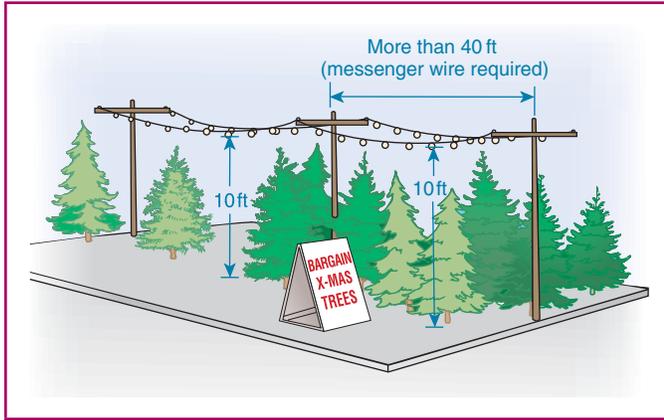

EXHIBIT 225.2 Messenger wire required for festoon lighting conductors in a span exceeding 40 feet.

provide a path to ground. Such methods of attachment could not be relied on for a permanent or secure means of support.

225.7 Lighting Equipment Installed Outdoors.

(A) General. For the supply of lighting equipment installed outdoors, the branch circuits shall comply with **Article 210** and **225.7(B)** through (D).

(B) Common Neutral. The ampacity of the neutral conductor shall not be less than the maximum net calculated load current between the neutral conductor and all ungrounded conductors connected to any one phase of the circuit.

Section 200.4 permits the use of a single neutral conductor shared between multiple ungrounded branch-circuit conductors for outdoor lighting. The branch-circuit configuration can be 2-wire, line-to-neutral connected, in which multiple ungrounded conductors share a common neutral, or it can be configured in a single- or 3-phase multiwire arrangement. The neutral capacity is required to be not less than the total load of all ungrounded conductors connected to any one phase of the circuit.

Exhibit 225.3 illustrates a 120/240-volt, single-phase, 3-wire system, and **Exhibit 225.4** illustrates a 208Y/120-volt, 3-phase, 4-wire system. In each of these illustrations, all branch circuits are rated at 20 amperes. The maximum unbalanced current that can occur on the 4-wire system shown in **Exhibit 225.3** is four times 20 amperes, or 80 amperes. The maximum unbalanced current that can occur on a 3-phase system with the load connected as shown in **Exhibit 225.4** is 80 amperes, due to the load on phase A. A 4 AWG Cu XHHW conductor can be used.

(C) 277 Volts to Ground. Circuits exceeding 120 volts, nominal, between conductors and not exceeding 277 volts, nominal, to ground shall be permitted to supply luminaires for illumination of outdoor areas of industrial establishments, office buildings, schools, stores, and other commercial or public buildings.

See also

210.6(D) for tunnel and pole-mounted luminaires with voltages greater than 277 volts to ground

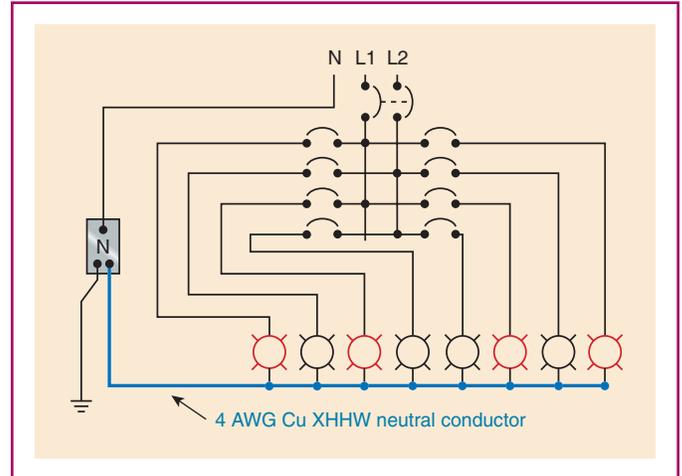

EXHIBIT 225.3 A 120/240-volt, single-phase, 3-wire system (maximum unbalanced current of 80 amperes is used to size the common neutral conductor).

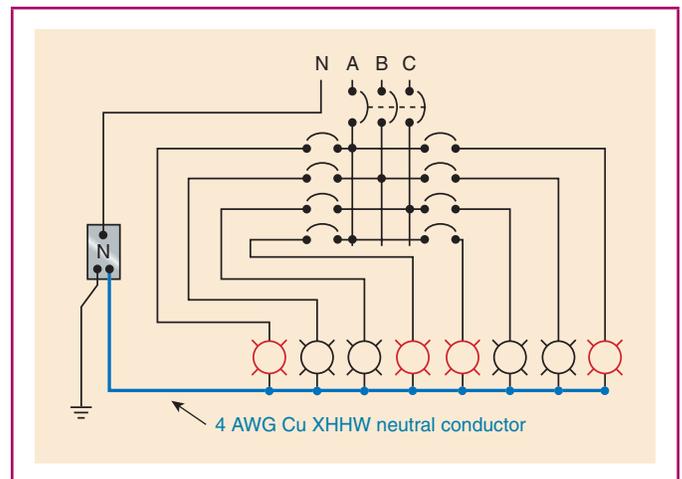

EXHIBIT 225.4 A 208Y/120-volt, 3-phase, 4-wire system (maximum unbalanced current of 80 amperes is used to size the common neutral conductor).

(D) 1000 Volts Between Conductors. Circuits exceeding 277 volts, nominal, to ground and not exceeding 1000 volts, nominal, between conductors shall be permitted to supply the auxiliary equipment of electric-discharge lamps in accordance with **210.6(D)(1)**.

225.8 Calculation of Loads 1000 Volts, Nominal, or Less.

(A) Branch Circuits. The load on outdoor branch circuits shall be as determined by **220.10**.

(B) Feeders. The load on outdoor feeders shall be as determined by **Part III** of **Article 220**.

225.10 Wiring on Buildings (or Other Structures). The installation of outside wiring on surfaces of buildings (or other structures) shall be permitted for circuits not exceeding 1000 volts, nominal, as the following:

- (1) Auxiliary gutters
- (2) Busways
- (3) Cable trays
- (4) Cablebus
- (5) Electrical metallic tubing (EMT)
- (6) Flexible metal conduit (FMC)
- (7) Intermediate metal conduit (IMC)
- (8) Liquidtight flexible metal conduit (LFMC)
- (9) Liquidtight flexible nonmetallic conduit (LFNC)
- (10) Messenger-supported wiring
- (11) Multiconductor cable
- (12) Open wiring on insulators
- (13) Reinforced thermosetting resin conduit (RTRC)
- (14) Rigid metal conduit (RMC)
- (15) Rigid polyvinyl chloride conduit (PVC)
- (16) Type MC cable
- (17) Type MI cable
- (18) Type UF cable
- (19) Wireways

Circuits of over 1000 volts, nominal, shall be installed as provided in 300.37.

225.11 Feeder and Branch-Circuit Conductors Entering, Exiting, or Attached to Buildings or Structures. Feeder and branch circuit conductors entering or exiting buildings or structures shall be installed in accordance with the requirements of 230.52. Overhead branch circuits and feeders attached to buildings or structures shall be installed in accordance with the requirements of 230.54.

225.12 Open-Conductor Supports. Open conductors shall be supported on knobs, racks, brackets, or strain insulators, that are made of glass, porcelain, or other approved materials.

225.14 Open-Conductor Spacings.

(A) 1000 Volts, Nominal, or Less. Conductors of 1000 volts, nominal, or less, shall comply with the spacings provided in Table 230.51(C).

(B) Over 1000 Volts, Nominal. Conductors of over 1000 volts, nominal, shall comply with the spacings provided in 110.36 and 490.24.

(C) Separation from Other Circuits. Open conductors shall be separated from open conductors of other circuits or systems by not less than 100 mm (4 in.).

(D) Conductors on Poles. Conductors on poles shall have a separation of not less than 300 mm (1 ft) where not placed on racks or brackets. Conductors supported on poles shall provide a horizontal climbing space not less than the following:

- (1) Power conductors below communications conductors — 750 mm (30 in.)
- (2) Power conductors alone or above communications conductors:
 - a. 300 volts or less — 600 mm (24 in.)
 - b. Over 300 volts — 750 mm (30 in.)
- (3) Communications conductors below power conductors — same as power conductors
- (4) Communications conductors alone — no requirement

Sufficient space is required for personnel to climb over or through conductors to safely work with conductors on the pole.

225.15 Supports over Buildings. Supports over a building shall be in accordance with 230.29.

225.16 Attachment to Buildings.

(A) Point of Attachment. The point of attachment to a building shall be in accordance with 230.26.

(B) Means of Attachment. The means of attachment to a building shall be in accordance with 230.27.

225.17 Masts as Supports. Only feeder or branch-circuit conductors specified within this section shall be permitted to be attached to the feeder and/or branch-circuit mast. Masts used for the support of final spans of feeders or branch circuits shall be installed in accordance with 225.17(A) and (B).

The rules for masts supporting overhead branch circuits and feeders are similar to the requirements in 230.28 for masts for supporting service drops. Conductors that are attached to the exterior of the mast are not permitted to be attached between the weatherhead and any coupling that is above a point of securement to the building. Attaching conductors in this space may put additional strain on the mast that could cause it to fail.

A mast supporting an overhead branch circuit or feeder span is not permitted to support conductors of other systems, such as overhead conductor spans for signaling, communications, or CATV systems.

(A) Strength. The mast shall have adequate strength or be supported by braces or guys to safely withstand the strain imposed by the overhead feeder or branch-circuit conductors. Hubs intended for use with a conduit serving as a mast for support of feeder or branch-circuit conductors shall be identified for use with a mast.

(B) Attachment. Feeder and/or branch-circuit conductors shall not be attached to a mast where the connection is between a weatherhead or the end of the conduit and a coupling where the coupling is located above the last point of securement to the building or other structure, or where the coupling is located above the building or other structure.

225.18 Clearance for Overhead Conductors and Cables. Overhead spans of open conductors and open multiconductor cables of not over 1000 volts, nominal, shall have a clearance of not less than the following:

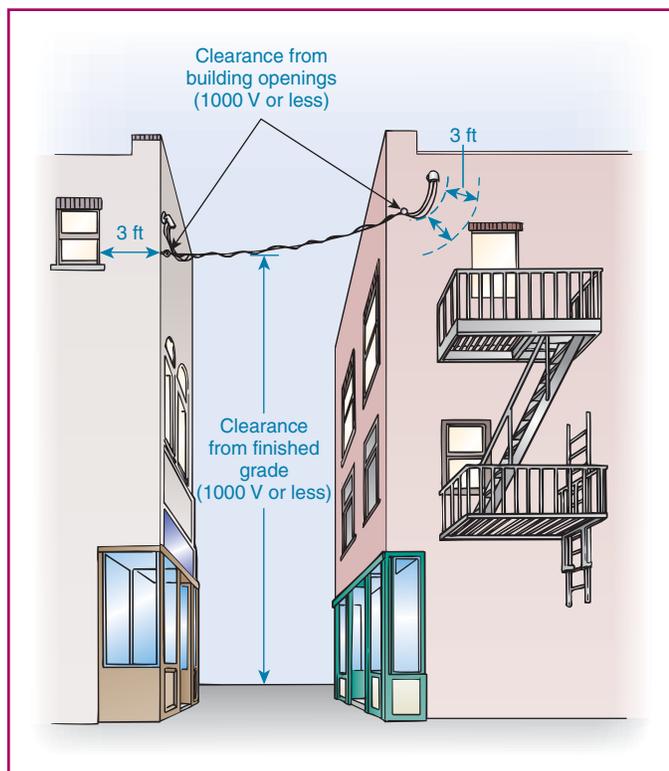

EXHIBIT 225.5 Clearances from ground and buildings for conductors not over 1000 volts.

- (1) 3.0 m (10 ft) — above finished grade, sidewalks, or from any platform or projection that will permit personal contact where the voltage does not exceed 150 volts to ground and accessible to pedestrians only
- (2) 3.7 m (12 ft) — over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground
- (3) 4.5 m (15 ft) — for those areas listed in the 3.7 m (12 ft) classification where the voltage exceeds 300 volts to ground
- (4) 5.5 m (18 ft) — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles, such as cultivated, grazing, forest, and orchard
- (5) 7.5 m (24½ ft) — over track rails of railroads

This section covers the requirements for clearances from ground, and 225.19 covers the requirements for clearances from buildings for conductors not over 1000 volts. Section 225.19(D) provides final span clearances from windows, doors, fire escapes, and similar areas where overhead conductors are subject to contact by persons. Exhibit 225.5 shows an example of where these clearance requirements apply.

225.19 Clearances from Buildings for Conductors of Not over 1000 Volts, Nominal.

(A) Above Roofs. Overhead spans of open conductors and open multiconductor cables shall have a vertical clearance of not less

than 2.7 m (8 ft 6 in.) above the roof surface. The vertical clearance above the roof level shall be maintained for a distance not less than 900 mm (3 ft) in all directions from the edge of the roof.

Exception No. 1: The area above a roof surface subject to pedestrian or vehicular traffic shall have a vertical clearance from the roof surface in accordance with the clearance requirements of 225.18.

Exception No. 2: Where the voltage between conductors does not exceed 300, and the roof has a slope of 100 mm in 300 mm (4 in. in 12 in.) or greater, a reduction in clearance to 900 mm (3 ft) shall be permitted.

Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.8 m (6 ft) of the conductors, 1.2 m (4 ft) horizontally, pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or approved support.

Exception No. 4: The requirement for maintaining the vertical clearance 900 mm (3 ft) from the edge of the roof shall not apply to the final conductor span where the conductors are attached to the side of a building.

(B) From Nonbuilding or Nonbridge Structures. From signs, chimneys, radio and television antennas, tanks, and other nonbuilding or nonbridge structures, clearances — vertical, diagonal, and horizontal — shall not be less than 900 mm (3 ft).

(C) Horizontal Clearances. Clearances shall not be less than 900 mm (3 ft).

(D) Final Spans. Final spans of feeders or branch circuits shall comply with 225.19(D)(1), (D)(2), and (D)(3).

(1) Clearance from Windows. Final spans to the building they supply, or from which they are fed, shall be permitted to be attached to the building, but they shall be kept not less than 900 mm (3 ft) from windows that are designed to be opened, and from doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.

Exception: Conductors run above the top level of a window shall be permitted to be less than the 900 mm (3 ft) requirement.

(2) Vertical Clearance. The vertical clearance of final spans above or within 900 mm (3 ft) measured horizontally of platforms, projections, or surfaces that will permit personal contact shall be maintained in accordance with 225.18.

(3) Building Openings. The overhead branch-circuit and feeder conductors shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they obstruct entrance to these openings.

(E) Zone for Fire Ladders. Where buildings exceed three stories or 15 m (50 ft) in height, overhead lines shall be arranged,

where practicable, so that a clear space (or zone) at least 1.8 m (6 ft) wide will be left either adjacent to the buildings or beginning not over 2.5 m (8 ft) from them to facilitate the raising of ladders when necessary for fire fighting.

225.20 Protection Against Physical Damage. Conductors installed on buildings, structures, or poles shall be protected against physical damage as provided for services in 230.50.

225.21 Multiconductor Cables on Exterior Surfaces of Buildings (or Other Structures). Supports for multiconductor cables on exterior surfaces of buildings (or other structures) shall be as provided in 230.51.

225.22 Raceways on Exterior Surfaces of Buildings or Other Structures. Raceways on exteriors of buildings or other structures shall be arranged to drain and shall be listed or approved for use in wet locations.

Raceways in exterior locations must be “listed or approved,” which allows discretion by the AHJ for products that are suitable for use in wet locations as well as recognizing listed products.

If raceways are exposed to weather or temperature changes, condensation is likely to occur, causing moisture to accumulate within raceways at low points of the installation and in junction boxes. Therefore, raceways are required to be installed so as to allow moisture to drain from the raceway through drain holes or other means provided at appropriate locations.

225.24 Outdoor Lampholders. Where outdoor lampholders are attached as pendants, the connections to the circuit wires shall be staggered. Where such lampholders have terminals of a type that puncture the insulation and make contact with the conductors, they shall be attached only to conductors of the stranded type.

Splices to branch-circuit conductors for outdoor lampholders of the Edison-base-type or “pigtail” sockets are required to be staggered so that splices will not be in close proximity to each other.

225.25 Location of Outdoor Lamps. Locations of lamps for outdoor lighting shall be below all energized conductors, transformers, or other electric utilization equipment, unless either of the following apply:

- (1) Clearances or other safeguards are provided for relamping operations.
- (2) Equipment is controlled by a disconnecting means that is lockable in accordance with 110.25.

The objective is to protect personnel while relamping outdoor luminaires. Section 225.18 requires a minimum clearance of 10 feet above grade or platforms for open conductors. In some cases it may be difficult to keep all electrical equipment above the lamps. Section 225.25(1) allows other clearances or safeguards to permit safe relamping, while the reference to 110.25 provides another alternative for safe relamping

through the use of a disconnecting means that can be locked in the open or off position.

225.26 Vegetation as Support. Vegetation such as trees shall not be used for support of overhead conductor spans.

Overhead conductor spans attached to a tree are subject to damage over the course of time as normal tree growth around the attachment device causes the mounting insulators to break. Normal growth can also cause tree bark to grow around the insulation. This requirement reduces the likelihood of chafing or degradation of the conductor insulation. These conditions can create a shock hazard for tree trimmers and tree climbers.

Outdoor luminaires and associated equipment are permitted by 410.36(G) to be supported by trees. To prevent the chafing damage, conductors are run up the tree from an underground wiring method.

See also

300.5(D) for requirements on the protection of direct-buried conductors emerging from below grade

225.27 Raceway Seal. Where a raceway enters a building or structure from outside, it shall be sealed. Spare or unused raceways shall also be sealed. Sealants shall be identified for use with cable insulation, conductor insulation, bare conductor, shield, or other components.

Part II. Buildings or Other Structures Supplied by a Feeder(s) or Branch Circuit(s)

Part II of Article 225 covers outside branch circuits and feeders on properties where outside branch circuits and feeders are the source of electrical supply for buildings and structures. Important in the application of the Part II requirements are the Article 100 definitions of *service point*, *service*, *service equipment*, *feeder*, and *branch circuit*. Determining what constitutes a set of feeder or branch-circuit conductors versus a set of service conductors depends on a clear understanding of where the service point is located and where the service and service equipment for a premises are located. In some cases, particularly with medium- and high-voltage distribution, the service location of a campus or multi-building facility is a switchyard or substation. With the location of the service point and service equipment established, the requirements for outside branch circuits and feeders from Part II (and Part III if over 1000 volts) can be properly applied.

The feeders and branch circuits covered in Part II may originate in one building or structure and supply another building or structure, or they may originate in outdoor equipment such as freestanding switchboards, switchgear, transformers, or generators and supply equipment located in buildings or structures. Such distribution is permitted under the condition that the distribution system is under a single management. Many of the requirements in Part II covering the number of feeders or branch circuits and the location and type of disconnecting means are similar to the requirements for services in Article 230.

225.30 Number of Supplies. A building or other structure that is served by a branch circuit or feeder on the load side of a service

disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 225.30(A) through (E). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit.

Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder or branch circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E).

(A) Special Conditions. Additional feeders or branch circuits shall be permitted to supply the following:

- (1) Fire pumps
- (2) Emergency systems
- (3) Legally required standby systems
- (4) Optional standby systems
- (5) Parallel power production systems
- (6) Systems designed for connection to multiple sources of supply for the purpose of enhanced reliability
- (7) Electric vehicle charging systems listed, labeled, and identified for more than a single branch circuit or feeder

Double-ended (main-tie-main) switchgear supplied by two feeders is an example of an installation covered by 225.30(A)(6).

(B) Special Occupancies. By special permission, additional feeders or branch circuits shall be permitted for either of the following:

- (1) Multiple-occupancy buildings where there is no space available for supply equipment accessible to all occupants
- (2) A single building or other structure sufficiently large to make two or more supplies necessary

(C) Capacity Requirements. Additional feeders or branch circuits shall be permitted where the capacity requirements are in excess of 2000 amperes at a supply voltage of 1000 volts or less.

(D) Different Characteristics. Additional feeders or branch circuits shall be permitted for different voltages, frequencies, or phases, or for different uses such as control of outside lighting from multiple locations.

(E) Documented Switching Procedures. Additional feeders or branch circuits shall be permitted to supply installations under single management where documented safe switching procedures are established and maintained for disconnection.

Buildings on college campuses, multibuilding industrial facilities, and multibuilding commercial facilities are permitted to be supplied by secondary loop supply (secondary selective) networks if documented switching procedures are established. These switching procedures must establish a method to safely operate switches for the facility during maintenance and during alternative supply and emergency supply conditions. Keyed interlock systems are often used to reduce the likelihood of inappropriate switching procedures that could result in hazardous conditions.

225.31 Disconnecting Means. Means shall be provided for disconnecting all ungrounded conductors that supply or pass through the building or structure.

225.32 Location. The disconnecting means shall be installed either inside or outside of the building or structure served or where the conductors pass through the building or structure. The disconnecting means shall be at a readily accessible location nearest the point of entrance of the conductors. For the purposes of this section, the requirements in 230.6 shall be utilized.

Exception No. 1: For installations under single management, where documented safe switching procedures are established and maintained for disconnection, and where the installation is monitored by qualified individuals, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 2: For buildings or other structures qualifying under the provisions of Article 685, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 3: For towers or poles used as lighting standards, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 4: For poles or similar structures used only for support of signs installed in accordance with Article 600, the disconnecting means shall be permitted to be located elsewhere on the premises.

Although the requirement for locating the disconnecting means for a feeder or branch circuit supplying a structure is essentially the same as that specified for services in 230.70(A), there is an important difference. Where a building or structure is supplied by a feeder or branch circuit, an outside feeder or branch-circuit disconnecting means must always be at the building or structure supplied, unless one of the conditions in Exception No. 1 through Exception No. 4 to 225.32 can be applied.

Many campus-style facilities are supplied by a single utility service, in which the service disconnecting means is remote from the buildings or structures supplied. The supply conductors to the campus buildings are feeders or branch circuits. The feeder or branch-circuit disconnecting means for each building must be located inside or outside the building supplied, at the point nearest to where the supply conductors enter the building. This applies to conductors that supply a building and to conductors that pass through a building.

Exhibit 225.6 shows an example of a disconnecting means for a generator feeder that can be used to meet the requirements of Article 225, Article 445, and Articles 700, 701, or 702 as applicable. The disconnecting means is required to be “within sight” of the building or structure supplied by the generator. A conditional exception to 700.12(B)(6) permits the disconnecting means for an outdoor generator supplying an emergency system to be located other than within sight of the building(s) or structure(s) supplied by the generator. This

EXHIBIT 225.6 Disconnecting means for alternate source feeder supplying emergency, legally required standby, or optional standby loads or a combination of the three.

exception contains the same conditions that are used in 225.32, Exception No. 1.

225.33 Maximum Number of Disconnects.

(A) General. The disconnecting means for each supply permitted by 225.30 shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard or switchgear. There shall be no more than six disconnects per supply grouped in any one location.

Exception: For the purposes of this section, disconnecting means used solely for the control circuit of the ground-fault protection system, or the control circuit of the power-operated supply disconnecting means, installed as part of the listed equipment, shall not be considered a supply disconnecting means.

(B) Single-Pole Units. Two or three single-pole switches or breakers capable of individual operation shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with identified handle ties or a master handle to disconnect all ungrounded conductors with no more than six operations of the hand.

225.34 Grouping of Disconnects.

(A) General. The two to six disconnects as permitted in 225.33 shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six disconnecting means permitted in 225.33, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.

(B) Additional Disconnecting Means. The one or more additional disconnecting means for fire pumps or for emergency, legally required standby or optional standby system permitted by 225.30 shall be installed sufficiently remote from the one to six disconnecting means for normal supply to minimize the possibility of simultaneous interruption of supply.

225.35 Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's supply disconnecting means.

Exception: In a multiple-occupancy building where electric supply and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the supply disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

225.36 Type of Disconnecting Means. The disconnecting means specified in 225.31 shall be comprised of a circuit breaker, molded case switch, general-use switch, snap switch, or other approved means. Where applied in accordance with 250.32(B), Exception No. 1, the disconnecting means shall be suitable for use as service equipment.

The feeder or branch-circuit disconnecting means is required to be suitable for use as service equipment only where the feeder grounded conductor is also used as the return path for ground-fault current per 250.32(B)(1), Exceptions No. 1 and No. 2. A three- or four-way snap switch cannot be used as a disconnecting means for an outside branch circuit or feeder because it would not provide a positive indication that the circuit was disconnected.

225.37 Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through it or supplying it, a permanent plaque or directory shall be installed at each feeder and branch-circuit disconnect location denoting all other services, feeders, or branch circuits supplying that building or structure or passing through that building or structure and the area served by each.

This requirement correlates with 230.2(E) in that, if a building has multiple sources of supply, permanent identification at each supply (service, feeder, and branch circuit) disconnecting means is required. Permanent identification must have long-term durability. This identification is an important safety feature during an emergency, because in many cases first responders are not familiar with the electrical distribution system of a facility.

See also

- 700.7(A)** for emergency power sources
- 701.7(A)** for legally required standby sources
- 702.7(A)** for optional standby sources
- 705.10** for parallel power production sources
- 706.11(A)** for energy storage systems (ESS)

Exception No. 1: A plaque or directory shall not be required for large-capacity multibuilding industrial installations under single management, where it is ensured that disconnection can be accomplished by establishing and maintaining safe switching procedures.

Exception No. 2: This identification shall not be required for branch circuits installed from a dwelling unit to a second building or structure.

225.38 Disconnect Construction. Disconnecting means shall meet the requirements of **225.38(A)** through (D).

(A) Manually or Power Operable. The disconnecting means shall consist of either (1) a manually operable switch or a circuit breaker equipped with a handle or other suitable operating means or (2) a power-operable switch or circuit breaker, provided the switch or circuit breaker can be opened by hand in the event of a power failure.

(B) Simultaneous Opening of Poles. Each building or structure disconnecting means shall simultaneously disconnect all ungrounded supply conductors that it controls from the building or structure wiring system.

(C) Disconnection of Grounded Conductor. Where the building or structure disconnecting means does not disconnect the grounded conductor from the grounded conductors in the building or structure wiring, other means shall be provided for this purpose at the location of the disconnecting means. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose.

In a multisection switchboard or switchgear, disconnects for the grounded conductor shall be permitted to be in any section of the switchboard or switchgear, if the switchboard section or switchgear section is marked to indicate a grounded conductor disconnect is contained within the equipment.

(D) Indicating. The building or structure disconnecting means shall plainly indicate whether it is in the open or closed position.

225.39 Rating of Disconnect. The feeder or branch-circuit disconnecting means shall have a rating of not less than the calculated load to be supplied, determined in accordance with **Parts I and II** of **Article 220** for branch circuits, **Part III** or **IV** of **Article 220** for feeders, or **Part V** of **Article 220** for farm loads. Where the branch circuit or feeder disconnecting means

consists of more than one switch or circuit breaker, as permitted by **225.33**, combining the ratings of all the switches or circuit breakers for determining the rating of the disconnecting means shall be permitted. In no case shall the rating be lower than specified in **225.39(A)**, (B), (C), or (D).

(A) One-Circuit Installation. For installations to supply only limited loads of a single branch circuit, the branch circuit disconnecting means shall have a rating of not less than 15 amperes.

(B) Two-Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, the feeder or branch-circuit disconnecting means shall have a rating of not less than 30 amperes.

(C) One-Family Dwelling. For a one-family dwelling, the feeder disconnecting means shall have a rating of not less than 100 amperes, 3-wire.

(D) All Others. For all other installations, the feeder or branch-circuit disconnecting means shall have a rating of not less than 60 amperes.

225.40 Access to Overcurrent Protective Devices. Where a feeder overcurrent device is not readily accessible, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of a lower ampere rating than the feeder overcurrent device.

Part III. Over 1000 Volts

225.50 Sizing of Conductors. The sizing of conductors over 1000 volts shall be in accordance with **210.19(B)** for branch circuits and **215.2(B)** for feeders.

225.51 Isolating Switches. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute a building disconnecting means, an isolating switch with visible break contacts and meeting the requirements of **230.204(B)**, (C), and (D) shall be installed on the supply side of the disconnecting means and all associated equipment.

Exception: The isolating switch shall not be required where the disconnecting means is mounted on removable truck panels or switchgear units that cannot be opened unless the circuit is disconnected and that, when removed from the normal operating position, automatically disconnect the circuit breaker or switch from all energized parts.

225.52 Disconnecting Means.

(A) Location. A building or structure disconnecting means shall be located in accordance with **225.32**, or, if not readily accessible, it shall be operable by mechanical linkage from a readily accessible point. For multibuilding industrial installations under single management, it shall be permitted to be electrically operated by a readily accessible, remote-control device in a separate building or structure.

(B) Type. Each building or structure disconnect shall simultaneously disconnect all ungrounded supply conductors it controls and shall have a fault-closing rating not less than the maximum available short-circuit current available at its supply terminals.

This requirement is similar to the requirements found in 230.205(B). This disconnect can be an air, oil, sulfur hexafluoride, or vacuum breaker or switch. Where a switch is used, fuses are permitted to help with the fault-closing capability of the switch. Using fused load-break cutouts to switch sections of overhead lines and using load-break elbows to switch sections of underground lines are permitted. However, the building disconnecting means must be gang-operated to simultaneously open and close all ungrounded supply conductors. Load-break elbows and fused cutouts cannot be used as the building disconnecting means.

Exception: Where the individual disconnecting means consists of fused cutouts, the simultaneous disconnection of all ungrounded supply conductors shall not be required if there is a means to disconnect the load before opening the cutouts. A permanent legible sign shall be installed adjacent to the fused cutouts and shall read DISCONNECT LOAD BEFORE OPENING CUTOUTS.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault closing rating of the disconnecting means.

(C) Locking. Disconnecting means shall be lockable in accordance with 110.25.

Exception: Where an individual disconnecting means consists of fused cutouts, a suitable enclosure capable of being locked and sized to contain all cutout fuse holders shall be installed at a convenient location to the fused cutouts.

(D) Indicating. Disconnecting means shall clearly indicate whether they are in the open “off” or closed “on” position.

(E) Uniform Position. Where disconnecting means handles are operated vertically, the “up” position of the handle shall be the “on” position.

Exception: A switching device having more than one “on” position, such as a double throw switch, shall not be required to comply with this requirement.

(F) Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through or supplying it, a permanent plaque or directory shall be installed at each feeder and branch-circuit disconnect location that denotes all other services, feeders, or branch circuits supplying that building or structure or passing through that building or structure and the area served by each.

225.56 Inspections and Tests.

(A) Pre-Energization and Operating Tests. The complete electrical system design, including settings for protective, switching, and control circuits, shall be prepared in advance and made available on request to the authority having jurisdiction and shall be performance tested when first installed on-site. Each

protective, switching, and control circuit shall be adjusted in accordance with the system design and tested by actual operation using current injection or equivalent methods as necessary to ensure that each and every such circuit operates correctly to the satisfaction of the authority having jurisdiction.

The AHJ must be satisfied that the performance tests demonstrate proper operation. Section 225.56(B) requires that a report of all tests performed in accordance with 225.56(A) be provided to the AHJ prior to energizing the system. Adjustments of settings must be in accordance with the electrical system design.

(1) Instrument Transformers. All instrument transformers shall be tested to verify correct polarity and burden.

(2) Protective Relays. Each protective relay shall be demonstrated to operate by injecting current or voltage, or both, at the associated instrument transformer output terminal and observing that the associated switching and signaling functions occur correctly and in proper time and sequence to accomplish the protective function intended.

(3) Switching Circuits. Each switching circuit shall be observed to operate the associated equipment being switched.

(4) Control and Signal Circuits. Each control or signal circuit shall be observed to perform its proper control function or produce a correct signal output.

(5) Metering Circuits. All metering circuits shall be verified to operate correctly from voltage and current sources in a similar manner to protective relay circuits.

(6) Acceptance Tests. Complete acceptance tests shall be performed, after the substation installation is completed, on all assemblies, equipment, conductors, and control and protective systems, as applicable, to verify the integrity of all the systems.

(7) Relays and Metering Utilizing Phase Differences. All relays and metering that use phase differences for operation shall be verified by measuring phase angles at the relay under actual load conditions after operation commences.

(B) Test Report. A test report covering the results of the tests required in 225.56(A) shall be delivered to the authority having jurisdiction prior to energization.

Informational Note: For an example of acceptance specifications, see ANSI/NETA ATS-2013, Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems, published by the InterNational Electrical Testing Association.

225.60 Clearances over Roadways, Walkways, Rail, Water, and Open Land.

(A) 22 kV, Nominal, to Ground or Less. The clearances over roadways, walkways, rail, water, and open land for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in Table 225.60.

(B) Over 22 kV Nominal to Ground. Clearances for the categories shown in Table 225.60 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

TABLE 225.60 Clearances over Roadways, Walkways, Rail, Water, and Open Land

Location	Clearance	
	m	ft
Open land subject to vehicles, cultivation, or grazing	5.6	18.5
Roadways, driveways, parking lots, and alleys	5.6	18.5
Walkways	4.1	13.5
Rails	8.1	26.5
Spaces and ways for pedestrians and restricted traffic	4.4	14.5
Water areas not suitable for boating	5.2	17.0

(C) Special Cases. For special cases, such as where crossings will be made over lakes, rivers, or areas using large vehicles such as mining operations, specific designs shall be engineered considering the special circumstances and shall be approved by the authority having jurisdiction.

Informational Note: For additional information, see [ANSI/IEEE C2-2012, National Electrical Safety Code](#).

225.61 Clearances over Buildings and Other Structures.

(A) 22 kV Nominal to Ground or Less. The clearances over buildings and other structures for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in [Table 225.61](#).

(B) Over 22 kV Nominal to Ground. Clearances for the categories shown in [Table 225.61](#) shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

Informational Note: For additional information, see [ANSI/IEEE C2-2012, National Electrical Safety Code](#).

[Section 225.61](#) and [Table 225.61](#) provide clearance requirements and specific distances over buildings and structures that correlate with requirements in the *National Electrical Safety Code® (NESC)*.

TABLE 225.61 Clearances over Buildings and Other Structures

Clearance from Conductors or Live Parts from:	Horizontal		Vertical	
	m	ft	m	ft
Building walls, projections, and windows	2.3	7.5	—	—
Balconies, catwalks, and similar areas accessible to people	2.3	7.5	4.1	13.5
Over or under roofs or projections not readily accessible to people	—	—	3.8	12.5
Over roofs accessible to vehicles but not trucks	—	—	4.1	13.5
Over roofs accessible to trucks	—	—	5.6	18.5
Other structures	2.3	7.5	—	—

230.1 Scope. This article covers service conductors and equipment for control and protection of services and their installation requirements.

Informational Note: See [Figure 230.1](#).

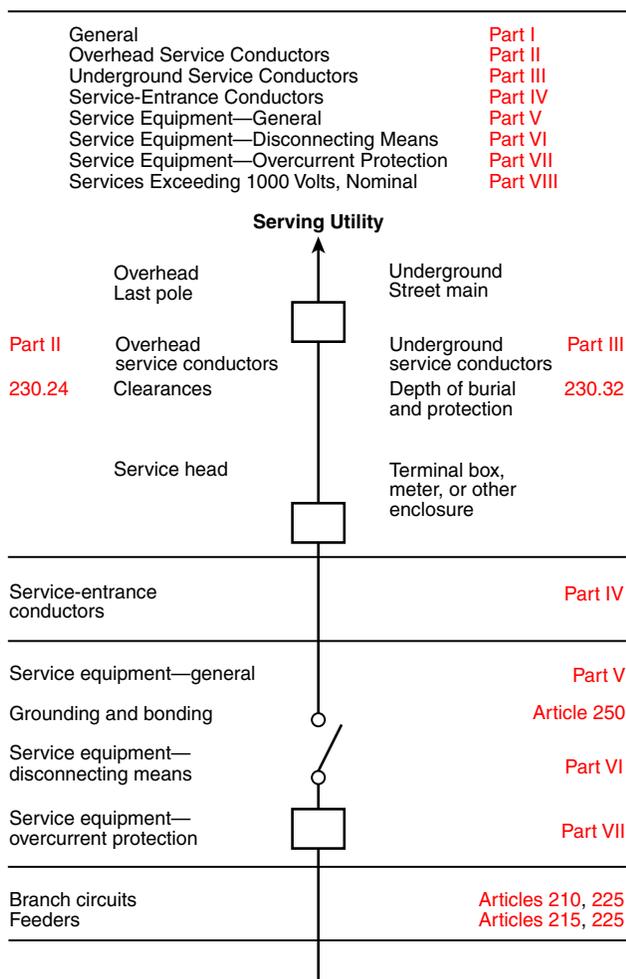

FIGURE 230.1 Services.

Part I. General

230.2 Number of Services. A building or other structure served shall be supplied by only one service unless permitted in 230.2(A) through (D). For the purpose of 230.40, Exception No. 2 only, underground sets of conductors, 1/0 AWG and larger, running to the same location and connected together at their supply end but not connected together at their load end shall be considered to be supplying one service.

The general requirement is for a building or structure to be supplied by only one service. However, under some conditions, a single service may not be adequate. Therefore, the installation of additional services is permitted as specified in conditions covered by 230.2(A) through (D). Where more than one service (or combination of service, feeder, and branch circuit) is installed, 230.2(E) requires that a permanent plaque or directory with the pertinent information on the multiple sources of supply be located at each supply source disconnecting means. Exhibits 230.1 through 230.6 illustrate examples of the general requirement that a building or structure be supplied by only one service.

(A) Special Conditions. Additional services shall be permitted to supply the following:

- (1) Fire pumps
- (2) Emergency systems
- (3) Legally required standby systems
- (4) Optional standby systems
- (5) Parallel power production systems
- (6) Systems designed for connection to multiple sources of supply for the purpose of enhanced reliability

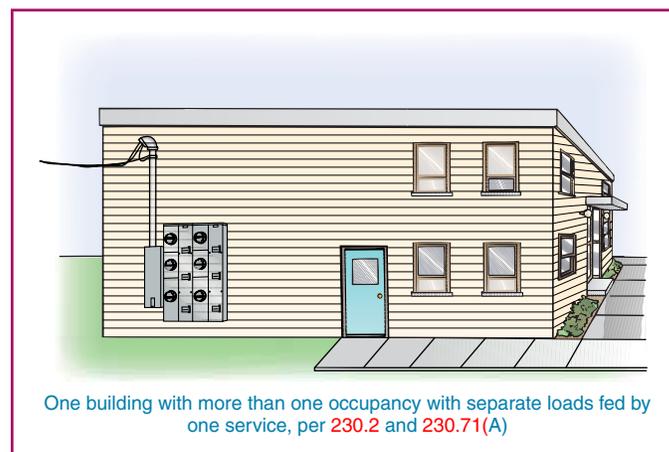

EXHIBIT 230.1 One service drop or one set of overhead service conductors supplying a single service equipment enclosure. (Optional arrangement to Exhibit 230.4.)

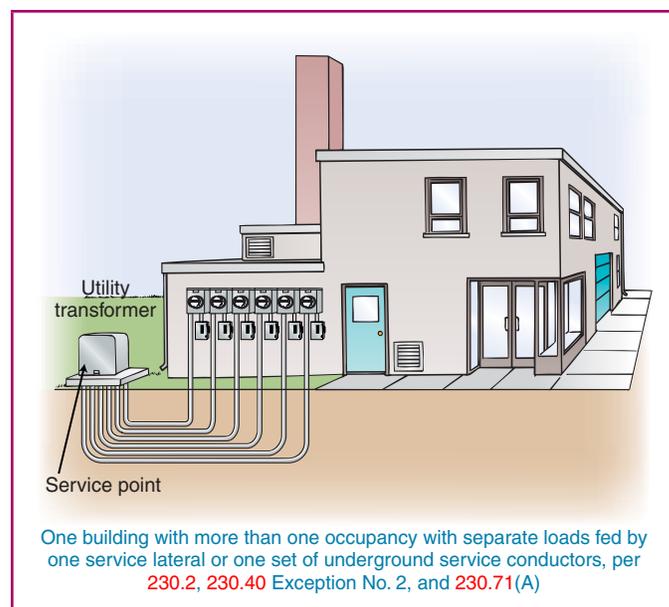

EXHIBIT 230.2 One set of underground service conductors consisting of six sets of conductors 1/0 AWG or larger (connected together at their supply end), terminating in six separate service equipment enclosures.

EXHIBIT 230.3 One service drop or one set of overhead service conductors supplying two service equipment enclosures installed at separate locations.

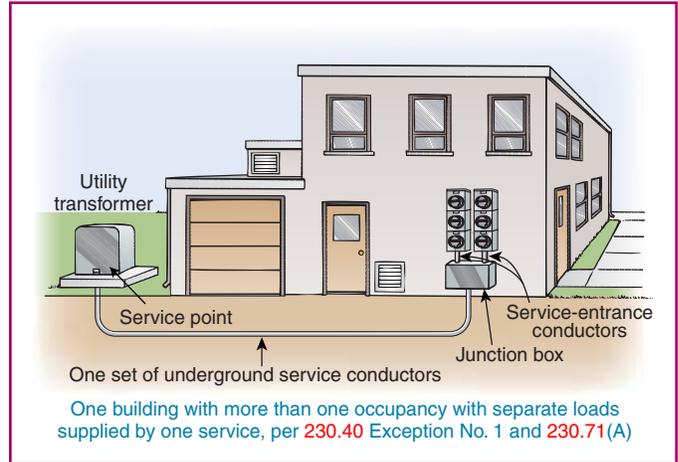

EXHIBIT 230.5 One set of underground service conductors supplying two sets of service-entrance conductors, terminating in two service equipment enclosures grouped in one location in which the combined number of service disconnecting means in the two enclosures cannot exceed six.

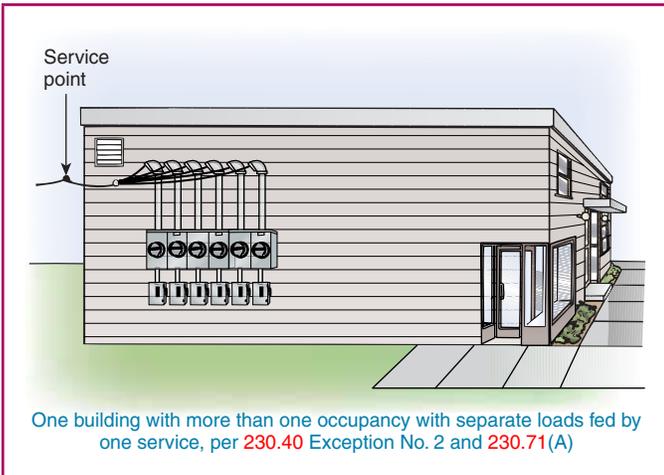

EXHIBIT 230.4 One set of overhead service conductors supplying a maximum of six separate service disconnecting means enclosures.

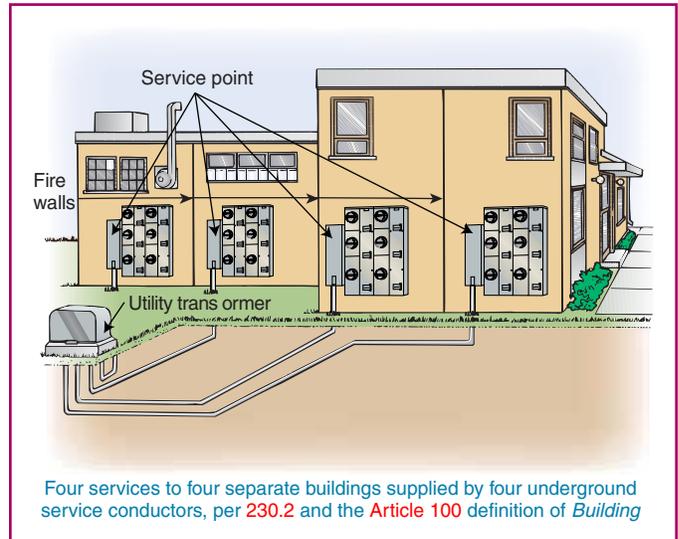

EXHIBIT 230.6 Four sets of service laterals supplying four service equipment enclosures installed at separate locations on a contiguous structure. Note presence of firewalls.

Completely separate services to the systems and equipment covered in 230.2(A) increases the overall reliability of the power supply to those systems by negating the impact of a disruption of the main building service. Unless the separate service is supplied from a different utility circuit, no protection is provided against an overall utility system outage. However, the effect of an outage resulting from a problem between the service point and the “normal,” or main, building service equipment will be limited to the normal service.

(B) Special Occupancies. By special permission, additional services shall be permitted for either of the following:

- (1) Multiple-occupancy buildings where there is no available space for service equipment accessible to all occupants

- (2) A single building or other structure sufficiently large to make two or more services necessary

Additional services for certain occupancies may be allowed by special permission — that is, written consent of the AHJ. See the definition of *authority having jurisdiction* in Article 100. The expansion of buildings often necessitates the addition of one or more services. It may be impractical or impossible to install one service for an industrial plant with sufficient capacity for any and all future loads. It is also impractical to run extremely long feeders. The AHJ should be consulted early in the planning stages to ascertain whether the special permission can be obtained.

(C) Capacity Requirements. Additional services shall be permitted under any of the following:

- (1) Where the capacity requirements are in excess of 2000 amperes at a supply voltage of 1000 volts or less
- (2) Where the load requirements of a single-phase installation are greater than the serving agency normally supplies through one service
- (3) By special permission

If two or more services are needed, 230.2(C) does not require that each service be rated 2000 amperes or that there be one service rated 2000 amperes and the additional service(s) rated for the calculated load in excess of 2000 amperes. For example, a building with a calculated load of 2300 amperes could have two 1200-ampere services. Additional services for lesser loads are also allowed by special permission.

Many electric utilities have specifications for, and have adopted special regulations covering, certain types of electrical loads and service equipment. Before electrical services for large buildings and facilities are designed, the serving utility should be consulted to determine line and transformer capacities.

Exhibits 230.7 through 230.10 illustrate examples of service configurations permitted by 230.2(B) and (C); 230.40, Exceptions No. 1 and No. 2; 230.71; and 230.72. The exhibits depict a number of service arrangements where more than a single service is — or where multiple sets of service-entrance conductors are — used to supply a building with one or more than one occupancy. The exhibits also illustrate the 230.71(A) requirement that not more than six service disconnecting means be grouped in one location; defining and determining this “one location” is a matter for the AHJ.

Additionally, a building may also be supplied by a feeder. This commonly occurs where the building is supplied with emergency, legally required standby, and/or optional standby power. Such installations are subject to the requirements of this article as well as Articles 225, 700, 701, and 702 as applicable.

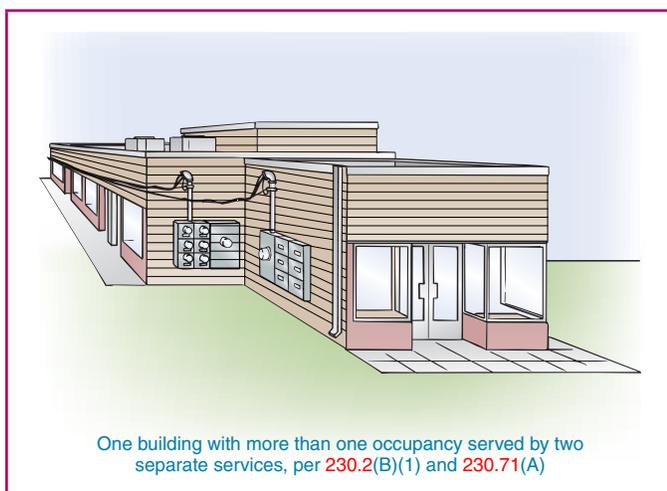

EXHIBIT 230.7 Two service drops or two sets of overhead service conductors supplying two services, installed at separate locations for a building where there is no available space for service equipment accessible to all occupants.

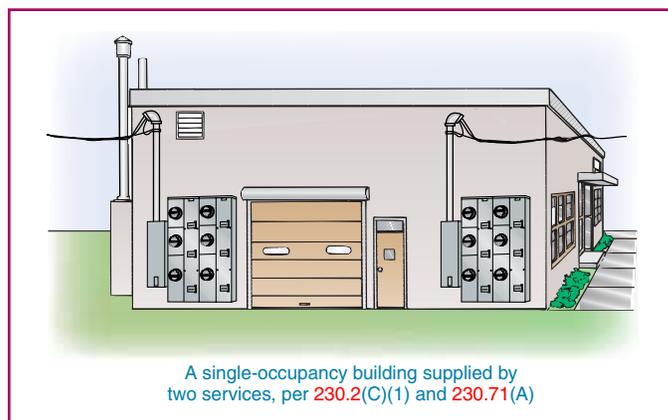

EXHIBIT 230.8 Two service drops or two sets of overhead service conductors supplying two services, installed at separate locations for a building with capacity requirements exceeding 2000 amperes.

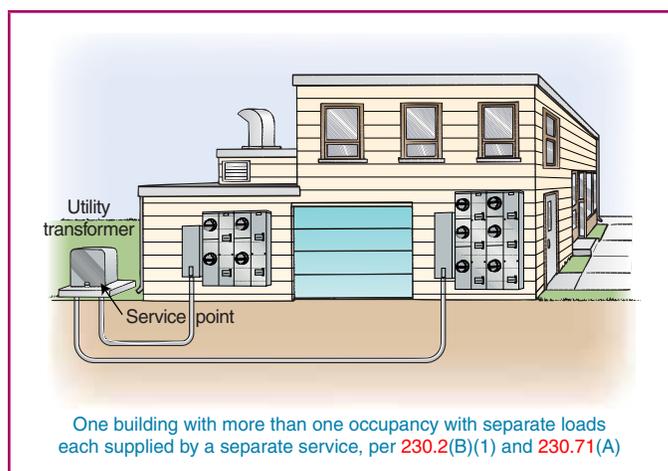

EXHIBIT 230.9 Two sets of underground service conductors, terminating in two service equipment enclosures installed at separate locations.

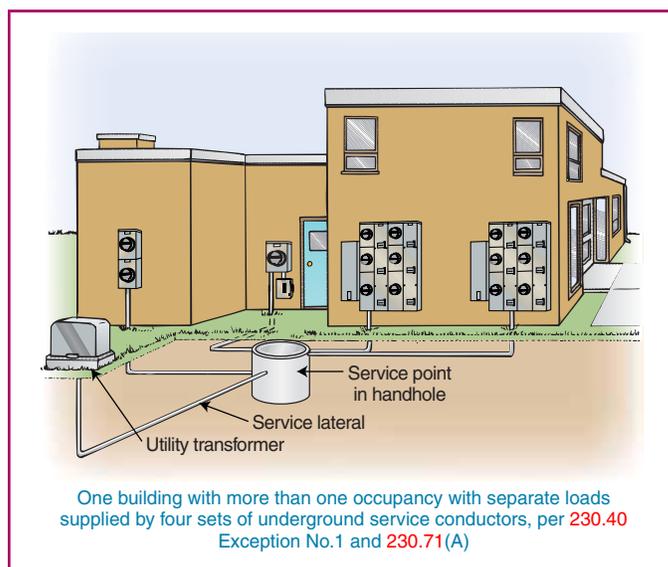

EXHIBIT 230.10 Four sets of underground service conductors supplying four service equipment enclosures installed at different locations.

(D) Different Characteristics. Additional services shall be permitted for different voltages, frequencies, or phases, or for different uses, such as for different rate schedules.

An example of different service characteristics is a facility served by a 3-wire, 120/240-volt, single-phase service and a 3-phase, 4-wire, 480Y/277-volt service. Where rate schedules are different, a second service is permitted for supplying a second meter on a different rate. Curtailable loads, interruptible loads, electric heating, and electric water heating are examples of loads that may be on a different rate schedule.

(E) Identification. Where a building or structure is supplied by more than one service, or any combination of branch circuits, feeders, and services, a permanent plaque or directory shall be installed at each service disconnect location denoting all other services, feeders, and branch circuits supplying that building or structure and the area served by each. See 225.37.

The permanent plaque or directory must indicate where the other disconnects that supply the building are located, as illustrated in Exhibit 230.11. All the other services on or in the building or structure and the area served by each must also be noted on the plaques or directories. This information is very important to first responders, maintenance staff, or other persons who need to disconnect the building or structure from all of its supplies. The plaques or directories must be of sufficient durability to withstand the environment and remain legible.

See also

225.37 and its commentary for further information on identification of multiple supply sources to a building or structure

230.3 One Building or Other Structure Not to Be Supplied Through Another. Service conductors supplying a building or other structure shall not pass through the interior of another building or other structure.

Although service conductors that supply one building or structure are prohibited from being run through the interior of another building or structure, service conductors are permitted to be installed along the exterior of one building to supply another building. Each building served in this manner is required to be provided with a disconnecting means for all ungrounded conductors, in accordance with Part VI.

For example, in Exhibit 230.12, the disconnecting means suitable for use as service equipment is shown on the exterior walls of Building No. 1 and Building No. 2. The prohibition against passing through one building to another applies only to service conductors, because feeders and branch circuits are provided with overcurrent protection at the point they receive their supply unless otherwise permitted by 240.21.

230.6 Conductors Considered Outside the Building. Conductors shall be considered outside of a building or other structure under any of the following conditions:

- (1) Where installed under not less than 50 mm (2 in.) of concrete beneath a building or other structure

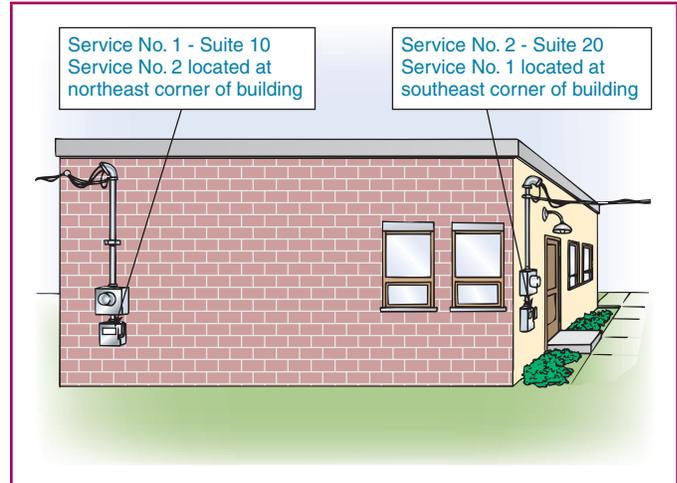

EXHIBIT 230.11 An example of two separate services installed at one building with permanent plaques or directories at each service disconnecting means location containing information describing all other services and the area served by each.

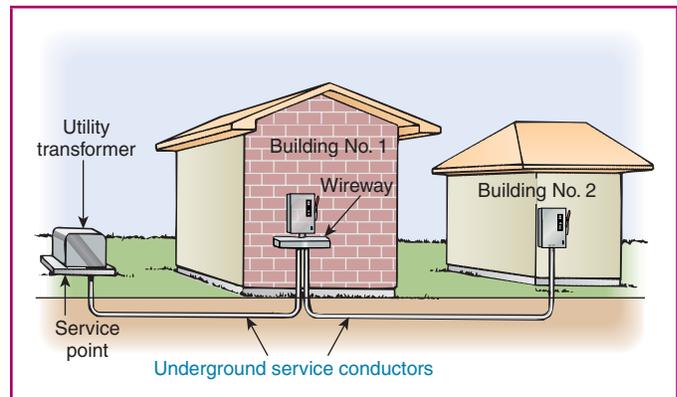

EXHIBIT 230.12 Service conductors installed to not pass through the interior of Building No. 1 to supply Building No. 2.

- (2) Where installed within a building or other structure in a raceway that is encased in concrete or brick not less than 50 mm (2 in.) thick
- (3) Where installed in any vault that meets the construction requirements of Article 450, Part III
- (4) Where installed in conduit and under not less than 450 mm (18 in.) of earth beneath a building or other structure
- (5) Where installed within rigid metal conduit (Type RMC) or intermediate metal conduit (Type IMC) used to accommodate the clearance requirements in 230.24 and routed directly through an eave but not a wall of a building

Exhibit 230.13 illustrates two of the conditions that permit service conductors to be considered “outside” a building.

Service conductors installed in an interior vault complying with the construction requirements of Part III of Article 450 are considered to be outside of a building regardless of whether or not the vault contains a

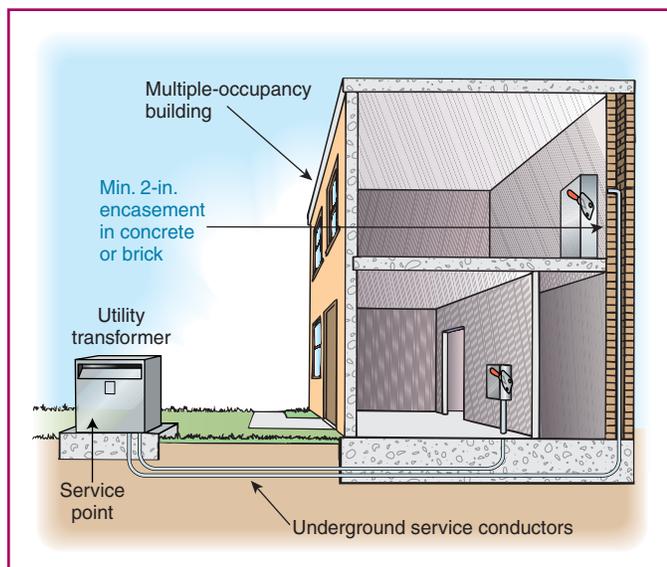

EXHIBIT 230.13 Service conductors considered outside a building where installed under not less than 2 inches of concrete beneath the building or in a raceway encased by not less than 2 inches of concrete or brick within the building.

transformer. Once the conductors leave the vault, the service disconnecting means has to be installed as required by 230.70(A)(1).

Service conductors installed under 18 inches of earth beneath the building are also considered outside the building according to 230.6(4). For example, a building or structure built on piers with service conductors buried beneath and running to a readily accessible service disconnecting means located within the interior of the building or structure

Service conductors passing through a roof overhang as covered in 230.24(A), Exception No. 3, and depicted in Exhibit 230.18 are considered to be outside the building per 230.6(5). This requirement would not allow horizontal runs through eaves.

230.7 Other Conductors in Raceway or Cable. Conductors other than service conductors shall not be installed in the same service raceway or service cable in which the service conductors are installed.

Service conductors are not provided with overcurrent protection where they receive their supply; they are protected against overload conditions at their load end by the service disconnect fuses or circuit breakers. If feeder or branch-circuit conductors are in the same raceway with service conductors during a fault, the fault current that could flow through them would be much higher than the ampacity of the feeder or branch-circuit conductors.

The gutter space of a panelboard cabinet or other electrical equipment enclosure is not a raceway (see Article 100) and is not subject to the requirement of 230.7. Service conductors, feeder conductors, and branch-circuit conductors can share the same gutter space, as shown in Exhibit 230.14. The panelboard cabinet gutter space accommodates a set of service conductors terminating on the 200-ampere main breaker,

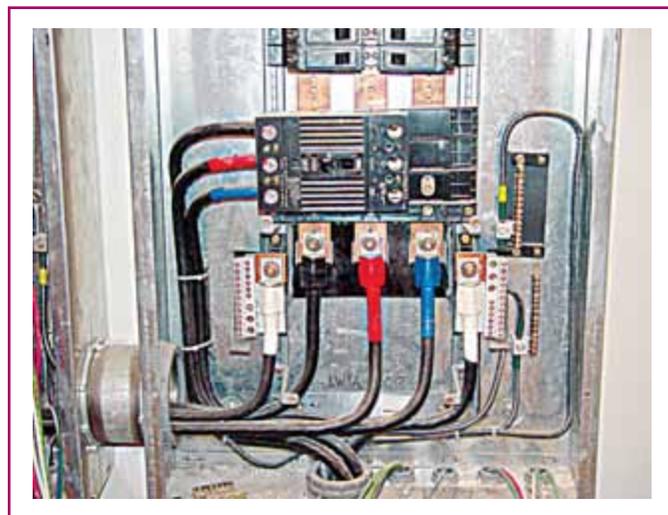

EXHIBIT 230.14 A panelboard cabinet gutter space can be shared by service conductors, feeder conductors, and branch-circuit conductors. (Courtesy of the International Association of Electrical Inspectors)

a set of feeder conductors supplying the adjacent panelboard, and several sets of branch-circuit conductors entering the bottom of the cabinet that will connect to OCPDs installed on the panelboard.

Exception No. 1: Grounding electrode conductors or supply side bonding jumpers or conductors shall be permitted within service raceways.

Exception No. 2: Load management control conductors having overcurrent protection shall be permitted within service raceways.

Load management control circuit conductors and switch leg conductors for use with special rate meters are permitted to be installed in the service raceway or cable because they are usually short and are directly associated with control or operation of the service conductors.

230.8 Raceway Seal. Where a service raceway enters a building or structure from an underground distribution system, it shall be sealed in accordance with 300.5(G). Spare or unused raceways shall also be sealed. Sealants shall be identified for use with the cable insulation, shield, or other components.

Sealant, such as duct seal or a bushing incorporating the physical characteristics of a seal, is required to be used to seal the ends of service raceways. The intent is to prevent water — usually the result of condensation due to temperature differences — from entering the service equipment via the raceway. The sealant material should be compatible with the conductor insulation and should not cause deterioration of the insulation over time.

See also

300.50(F) for raceway seal requirements for underground services over 1000 volts, nominal

Exhibit 300.9 for an example of a sealing bushing

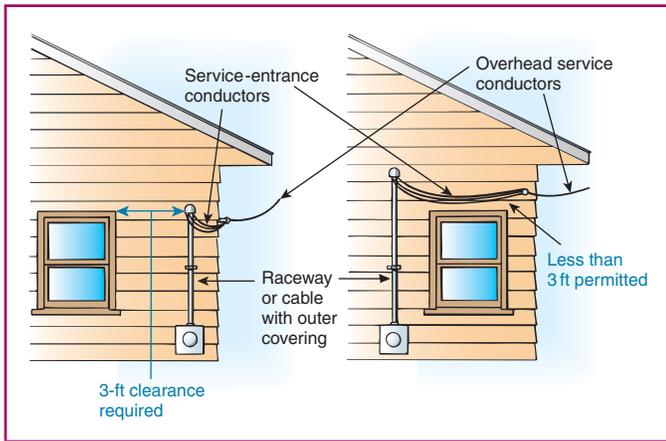

EXHIBIT 230.15 Required dimensions for service conductors located alongside a window (left) and overhead service conductors above the top edge of a window designed to be opened (right).

230.9 Clearances on Buildings. Service conductors and final spans shall comply with 230.9(A), (B), and (C).

(A) Clearances. Service conductors installed as open conductors or multiconductor cable without an overall outer jacket shall have a clearance of not less than 900 mm (3 ft) from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.

Exception: Conductors run above the top level of a window shall be permitted to be less than the 900 mm (3 ft) requirement

The 3-foot clearance applies to open conductors, not to a raceway or to a cable assembly that has an overall outer jacket, such as Types SE, MC, and MI cables. The intent is to protect the conductors from physical damage and to protect persons from accidental contact with the conductors. The exception permits service conductors, including service-entrance conductors, overhead service conductors, and service-drop conductors, to be located just above window openings, because they are considered out of reach, as illustrated in Exhibit 230.15.

(B) Vertical Clearance. The vertical clearance of final spans above, or within 900 mm (3 ft) measured horizontally of platforms, projections, or surfaces that will permit personal contact shall be maintained in accordance with 230.24(B).

Service conductors must not be located where a person could reach and touch them. The amount of vertical clearance required depends on the location and voltage of the overhead conductors.

Exhibit 230.16 illustrates an installation where the 10-foot clearance is based on the conditions described in 230.24(B)(1).

(C) Building Openings. Overhead service conductors shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they obstruct entrance to these building openings.

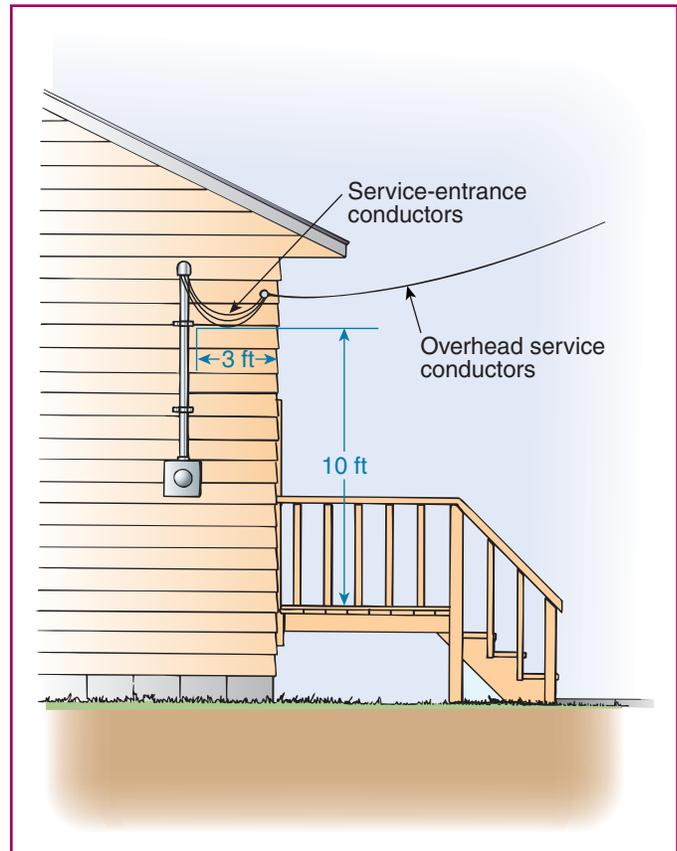

EXHIBIT 230.16 Required dimensions for service conductors located above a stair landing.

230.10 Vegetation as Support. Vegetation such as trees shall not be used for support of overhead service conductors or service equipment.

Part II. Overhead Service Conductors

230.22 Insulation or Covering. Individual conductors shall be insulated or covered.

Exception: The grounded conductor of a multiconductor cable shall be permitted to be bare.

230.23 Size and Rating.

(A) General. Conductors shall have sufficient ampacity to carry the current for the load as calculated in accordance with Article 220 and shall have adequate mechanical strength.

If a load is to be added to any service, the installer must be aware of all existing loads and the potential for overloading the service conductors. The serving electric utility may need to be notified if significant load is added to ensure that adequate capacity is available.

(B) Minimum Size. The conductors shall not be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

Exception: Conductors supplying only limited loads of a single branch circuit — such as small polyphase power, controlled water heaters, and similar loads — shall not be smaller than 12 AWG hard-drawn copper or equivalent.

(C) Grounded Conductors. The grounded conductor shall not be less than the minimum size as required by 250.24(C).

230.24 Clearances. Overhead service conductors shall not be readily accessible and shall comply with 230.24(A) through (E) for services not over 1000 volts, nominal.

(A) Above Roofs. Conductors shall have a vertical clearance of not less than 2.5 m (8 ft) above the roof surface. The vertical clearance above the roof level shall be maintained for a distance of not less than 900 mm (3 ft) in all directions from the edge of the roof.

Exception No. 1: The area above a roof surface subject to pedestrian or vehicular traffic shall have a vertical clearance from the roof surface in accordance with the clearance requirements of 230.24(B).

Exception No. 2: Where the voltage between conductors does not exceed 300 and the roof has a slope of 100 mm in 300 mm (4 in. in 12 in.) or greater, a reduction in clearance to 900 mm (3 ft) shall be permitted.

This reduction is for a roof sloped not less than 4 inches vertically in 12 inches horizontally, as illustrated in Exhibit 230.17. Steeply sloped roofs are less likely to be walked on. The conductors' length over the roof is not restricted.

Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.8 m (6 ft) of overhead service conductors, 1.2 m (4 ft) horizontally, pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or approved support.

Informational Note: See 230.28 for mast supports.

This reduction is for service-mast (through-the-roof) installations where the mast is located within 4 feet of the edge of the roof, measured horizontally, as illustrated in Exhibit 230.18. Exception No. 3 applies to the overhanging portion of sloped and flat roofs. Not more than 6 feet of conductors is permitted to pass over the roof.

Exception No. 4: The requirement for maintaining the vertical clearance 900 mm (3 ft) from the edge of the roof shall not apply to the final conductor span where the service drop or overhead service conductors are attached to the side of a building.

The final span of service drop or overhead service conductors attached to the side of a building is exempt from the 8-foot and 3-foot clearance

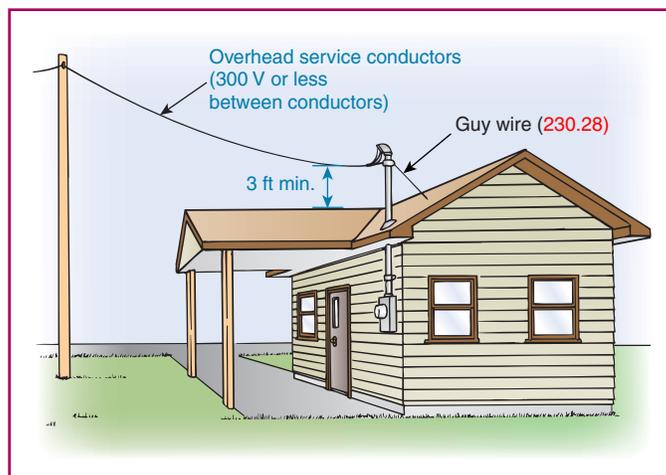

EXHIBIT 230.17 Permitted reduction to 3-foot clearance above a sloped roof.

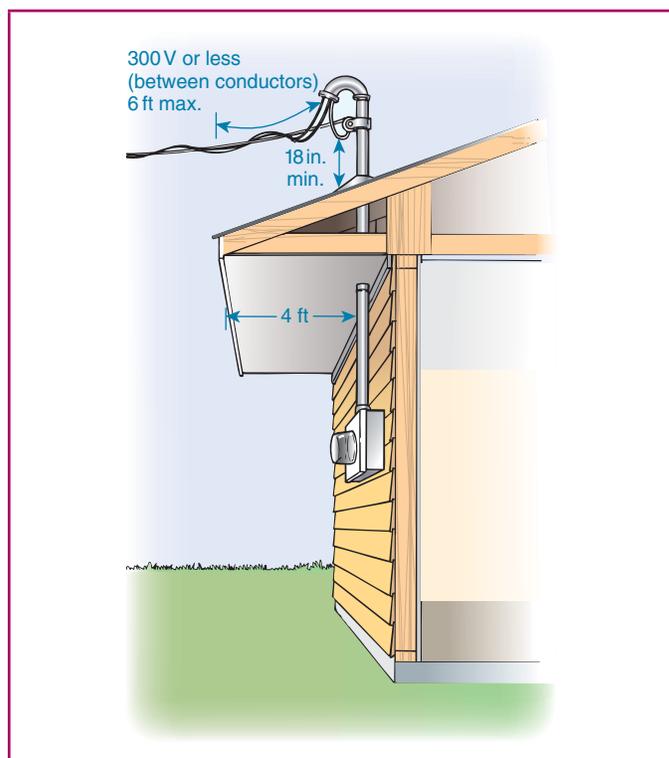

EXHIBIT 230.18 Permitted reduction to 18-inch clearance above an overhang roof penetration.

requirements to allow the service conductors to be attached to the building, as illustrated in Exhibit 230.19.

Exception No. 5: Where the voltage between conductors does not exceed 300 and the roof area is guarded or isolated, a reduction in clearance to 900 mm (3 ft) shall be permitted.

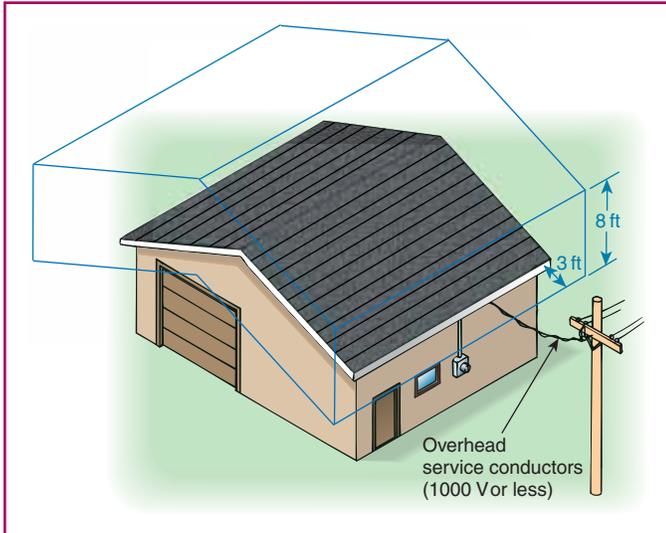

EXHIBIT 230.19 Permitted clearance of the final span of overhead service conductors.

(B) Vertical Clearance for Overhead Service Conductors. Overhead service conductors, where not in excess of 600 volts, nominal, shall have the following minimum clearance from final grade:

- (1) 3.0 m (10 ft) — at the electrical service entrance to buildings, also at the lowest point of the drip loop of the building electrical entrance, and above areas or sidewalks accessible only to pedestrians, measured from final grade or other accessible surface only for overhead service conductors supported on and cabled together with a grounded bare messenger where the voltage does not exceed 150 volts to ground
- (2) 3.7 m (12 ft) — over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground
- (3) 4.5 m (15 ft) — for those areas listed in the 3.7 m (12 ft) classification where the voltage exceeds 300 volts to ground
- (4) 5.5 m (18 ft) — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land such as cultivated, grazing, forest, and orchard
- (5) 7.5 m (24½) over tracks of railroads

Exhibit 230.20 illustrates the required 10-foot, 12-foot, 15-foot, and 18-foot vertical clearances from ground for overhead service conductors up to 600 volts. The voltages given are nominal voltages to ground, not the nominal voltage between circuit conductors specified in 230.24(A), Exceptions No. 2 and No. 3. A 480Y/277-volt system (277 volts to ground) is covered by the 12-foot clearance requirement in 230.24(B)(2), but overhead service conductors supplied by an ungrounded 480-volt system (considered to be 480 volts to ground) are required to have a 15-foot clearance over commercial areas not subject to truck traffic, in accordance with 230.24(B)(3).

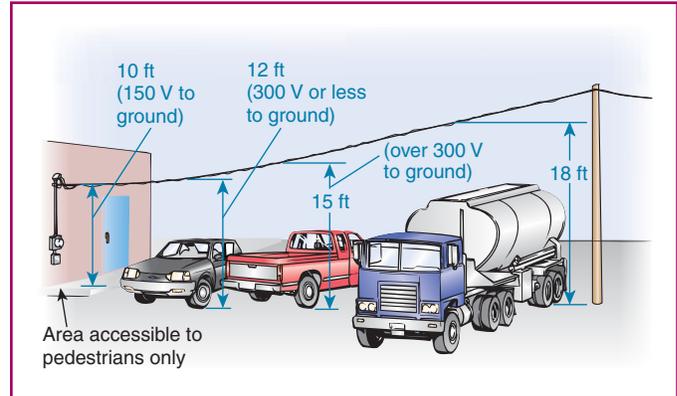

EXHIBIT 230.20 Clearances from grade for overhead service conductors.

(C) Clearance from Building Openings. See 230.9.

(D) Clearance from Swimming Pools. See 680.9.

(E) Clearance from Communication Wires and Cables. Clearance from communication wires and cables shall be in accordance with 830.44(A)(4).

230.26 Point of Attachment. The point of attachment of the overhead service conductors to a building or other structure shall provide the minimum clearances as specified in 230.9 and 230.24. In no case shall this point of attachment be less than 3.0 m (10 ft) above finished grade.

230.27 Means of Attachment. Multiconductor cables used for overhead service conductors shall be attached to buildings or other structures by fittings identified for use with service conductors. Open conductors shall be attached to fittings identified for use with service conductors or to noncombustible, nonabsorbent insulators securely attached to the building or other structure.

See also

230.51 for mounting and supporting of service cables and individual open service conductors

230.54 for connections at service heads

230.28 Service Masts as Supports. Only power service-drop or overhead service conductors shall be permitted to be attached to a service mast. Service masts used for the support of service-drop or overhead service conductors shall be installed in accordance with 230.28(A) and (B).

(A) Strength. The service mast shall be of adequate strength or be supported by braces or guys to withstand safely the strain imposed by the service-drop or overhead service conductors. Hubs intended for use with a conduit that serves as a service mast shall be identified for use with service-entrance equipment.

(B) Attachment. Service-drop or overhead service conductors shall not be attached to a service mast between a weatherhead or the end of the conduit and a coupling, where the coupling

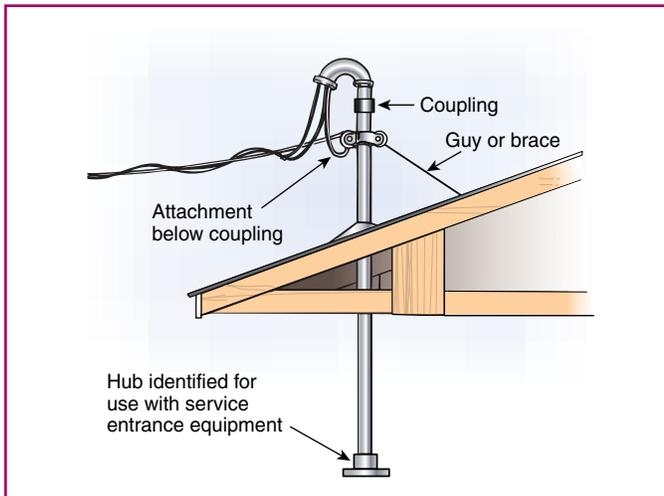

EXHIBIT 230.21 The service conductors must not be secured above the fitting because the stress above the fitting could weaken the assembly.

is located above the last point of securement to the building or other structure or is located above the building or other structure.

If the service drop is secured to the mast, a guy wire may be needed to support the mast and provide the required mechanical strength to support the service drop. As noted in 230.28(B), the service drop is not permitted to be secured to the mast between the weatherhead or end of the conduit and a coupling installed above the last point where the conduit is secured to a building or structure. Securing the conductors above the fitting may put undue stress on the assembly. See Exhibit 230.21. Communications conductors such as those for cable TV or telephone service are not permitted to be attached to the service mast.

230.29 Supports over Buildings. Service conductors passing over a roof shall be securely supported by substantial structures. For a grounded system, where the substantial structure is metal, it shall be bonded by means of a bonding jumper and listed connector to the grounded overhead service conductor. Where practicable, such supports shall be independent of the building.

Part III. Underground Service Conductors

230.30 Installation.

(A) Insulation. Underground service conductors shall be insulated for the applied voltage.

Exception: A grounded conductor shall be permitted to be uninsulated as follows:

- (1) Bare copper used in a raceway
- (2) Bare copper for direct burial where bare copper is approved for the soil conditions
- (3) Bare copper for direct burial without regard to soil conditions where part of a cable assembly identified for underground use

- (4) Aluminum or copper-clad aluminum without individual insulation or covering where part of a cable assembly identified for underground use in a raceway or for direct burial

Due to the likelihood of corrosion, aluminum and copper-clad aluminum conductors must be insulated if they are run in a raceway or direct buried, unless they are part of a cable assembly identified for underground use.

(B) Wiring Methods. Underground service conductors shall be installed in accordance with the applicable requirements of this Code covering the type of wiring method used and shall be limited to the following methods:

- (1) Type RMC conduit
- (2) Type IMC conduit
- (3) Type NUCC conduit
- (4) Type HDPE conduit
- (5) Type PVC conduit
- (6) Type RTRC conduit
- (7) Type IGS cable
- (8) Type USE conductors or cables
- (9) Type MV or Type MC cable identified for direct burial applications
- (10) Type MI cable, where suitably protected against physical damage and corrosive conditions

230.31 Size and Rating.

(A) General. Underground service conductors shall have sufficient ampacity to carry the current for the load as calculated in accordance with Article 220 and shall have adequate mechanical strength.

(B) Minimum Size. The conductors shall not be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

Exception: Conductors supplying only limited loads of a single branch circuit — such as small polyphase power, controlled water heaters, and similar loads — shall not be smaller than 12 AWG copper or 10 AWG aluminum or copper-clad aluminum.

(C) Grounded Conductors. The grounded conductor shall not be less than the minimum size required by 250.24(C).

See also

310.15(B)(4) for the allowable ampacity of bare and covered conductors

310.15(B)(7)(4) for further information on sizing the grounded conductor for dwelling services

230.32 Protection Against Damage. Underground service conductors shall be protected against damage in accordance with 300.5. Service conductors entering a building or other structure shall be installed in accordance with 230.6 or protected by a raceway wiring method identified in 230.43.

230.33 Spliced Conductors. Service conductors shall be permitted to be spliced or tapped in accordance with 110.14, 300.5(E), 300.13, and 300.15.

Part IV. Service-Entrance Conductors

230.40 Number of Service-Entrance Conductor Sets. Each service drop, set of overhead service conductors, set of underground service conductors, or service lateral shall supply only one set of service-entrance conductors.

Exception No. 1: A building with more than one occupancy shall be permitted to have one set of service-entrance conductors for each service, as defined in 230.2, run to each occupancy or group of occupancies. If the number of service disconnect locations for any given classification of service does not exceed six, the requirements of 230.2(E) shall apply at each location. If the number of service disconnect locations exceeds six for any given supply classification, all service disconnect locations for all supply characteristics, together with any branch circuit or feeder supply sources, if applicable, shall be clearly described using suitable graphics or text, or both, on one or more plaques located in an approved, readily accessible location(s) on the building or structure served and as near as practicable to the point(s) of attachment or entry(ies) for each service drop or service lateral, and for each set of overhead or underground service conductors.

If a building has more than one occupancy — such as multifamily dwellings, strip malls, and office buildings — each service drop, set of overhead service conductors, set of underground service conductors, or service lateral is allowed to supply more than one set of service-entrance conductors, provided they are run to each occupancy or group of occupancies. This requirement allows for multiple service disconnecting means locations for each service that supplies the building or structure. Based on this exception, one service may be arranged similarly to a building or structure that is supplied by multiple services. This exception does not limit the number of disconnecting means locations supplied by each service.

Because this exception permits more than one service equipment location on a single building or structure, a plaque or directory with information about the multiple equipment locations is required to be provided at each location.

If the number of service equipment locations for any class of service exceeds six, a master plaque(s) or directory(s) is required near the point where service conductors attach to or enter a building or structure. The information must describe the multiple service equipment locations using either text or a graphic or a combination. At the individual service equipment locations, the general marking required in 230.70(B) must be provided.

For example, if a mercantile building has eight storefronts and the building is supplied by a single 208Y/120-volt service, eight sets of service-entrance conductors can be installed with one set run to each occupancy. The service equipment at each occupancy can have up to six service disconnecting means in accordance with 230.71(A). Because the number of service disconnecting means locations for this service exceeds six, a permanent plaque(s) identifying the multiple supply equipment locations is required. The location of this plaque must be acceptable to the AHJ.

Exception No. 2: Where two to six service disconnecting means in separate enclosures are grouped at one location and supply

separate loads from one service drop, set of overhead service conductors, set of underground service conductors, or service lateral, one set of service-entrance conductors shall be permitted to supply each or several such service equipment enclosures.

Exhibits 230.2 through 230.10 provide examples of service configurations permitted by Exception No. 2 to 230.40.

Exception No. 3: A one-family dwelling unit and its accessory structures shall be permitted to have one set of service-entrance conductors run to each from a single service drop, set of overhead service conductors, set of underground service conductors, or service lateral.

A second set of service-entrance conductors supplied by a single service drop or lateral at a single-family dwelling unit is permitted to supply another building on the premises, such as a garage or storage shed. The utility meters may be grouped at one location, but in this application, the service disconnecting means are not required to be grouped at one location.

Exception No. 4: Two-family dwellings, multifamily dwellings, and multiple occupancy buildings shall be permitted to have one set of service-entrance conductors installed to supply the circuits covered in 210.25.

Exception No. 5: One set of service-entrance conductors connected to the supply side of the normal service disconnecting means shall be permitted to supply each or several systems covered by 230.82(5) or 230.82(6).

230.41 Insulation of Service-Entrance Conductors. Service-entrance conductors entering or on the exterior of buildings or other structures shall be insulated.

Exception: A grounded conductor shall be permitted to be uninsulated as follows:

- (1) Bare copper used in a raceway or part of a service cable assembly
- (2) Bare copper for direct burial where bare copper is approved for the soil conditions
- (3) Bare copper for direct burial without regard to soil conditions where part of a cable assembly identified for underground use
- (4) Aluminum or copper-clad aluminum without individual insulation or covering where part of a cable assembly or identified for underground use in a raceway, or for direct burial
- (5) Bare conductors used in an auxiliary gutter

230.42 Minimum Size and Rating.

(A) General. Service-entrance conductors shall have an ampacity of not less than the maximum load to be served. Conductors shall be sized to carry not less than the largest of 230.42(A)(1) or (A)(2). Loads shall be determined in accordance with Part III, IV, or V of Article 220, as applicable. Ampacity shall be determined

from 310.15. The maximum allowable current of busways shall be that value for which the busway has been listed or labeled.

- (1) Where the service-entrance conductors supply continuous loads or any combination of noncontinuous and continuous loads, the minimum service-entrance conductor size shall have an allowable ampacity not less than the sum of the noncontinuous loads plus 125 percent of continuous loads

Exception No. 1: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100 percent of the sum of the continuous and noncontinuous load.

Exception No. 2: The sum of the noncontinuous load and the continuous load if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating shall be permitted.

- (2) The minimum service-entrance conductor size shall have an ampacity not less than the maximum load to be served after the application of any adjustment or correction factors

(B) Specific Installations. In addition to the requirements of 230.42(A), the minimum ampacity for ungrounded conductors for specific installations shall not be less than the rating of the service disconnecting means specified in 230.79(A) through (D).

(C) Grounded Conductors. The grounded conductor shall not be smaller than the minimum size as required by 250.24(C).

The grounded service conductor provides the ground-fault current path in addition to its role as a circuit conductor. Each function is addressed using 220.61 and 250.24(C). The larger required conductor is used as the minimum size grounded service conductor. The NEC® does not prohibit sizing the grounded conductor simply by using the same size as the ungrounded (hot) service conductors.

230.43 Wiring Methods for 1000 Volts, Nominal, or Less.

Service-entrance conductors shall be installed in accordance with the applicable requirements of this Code covering the type of wiring method used and shall be limited to the following methods:

- (1) Open wiring on insulators
- (2) Type IGS cable
- (3) Rigid metal conduit (RMC)
- (4) Intermediate metal conduit (IMC)
- (5) Electrical metallic tubing (EMT)
- (6) Electrical nonmetallic tubing
- (7) Service-entrance cables
- (8) Wireways
- (9) Busways
- (10) Auxiliary gutters
- (11) Rigid polyvinyl chloride conduit (PVC)
- (12) Cablebus
- (13) Type MC cable
- (14) Mineral-insulated, metal-sheathed cable, Type MI

- (15) Flexible metal conduit (FMC) not over 1.8 m (6 ft) long or liquidtight flexible metal conduit (LFMC) not over 1.8 m (6 ft) long between a raceway, or between a raceway and service equipment, with a supply-side bonding jumper routed with the flexible metal conduit (FMC) or the liquidtight flexible metal conduit (LFMC) according to the provisions of 250.102(A), (B), (C), and (E)
- (16) Liquidtight flexible nonmetallic conduit (LFNC)
- (17) High density polyethylene conduit (HDPE)
- (18) Nonmetallic underground conduit with conductors (NUCC)
- (19) Reinforced thermosetting resin conduit (RTRC)

Section 230.43(15) permits no more than 6 feet of flexible metal conduit or liquidtight flexible metal conduit to be used as a service wiring method. Because of the high levels of fault energy available on the line side of the service disconnecting means, a bonding jumper must be installed where these raceway types are used for service conductors. The bonding jumper is allowed to be installed inside or outside the raceway, but when installed outside the raceway it must follow the path of the raceway and cannot exceed 6 feet in length. In order to minimize the impedance of the ground-fault current return path, the bonding jumper must not be wrapped or spiraled around the flexible conduit.

230.44 Cable Trays. Cable tray systems shall be permitted to support service-entrance conductors. Cable trays used to support service-entrance conductors shall contain only service-entrance conductors and shall be limited to the following methods:

- (1) Type SE cable
- (2) Type MC cable
- (3) Type MI cable
- (4) Type IGS cable
- (5) Single conductors 1/0 and larger that are listed for use in cable tray

Such cable trays shall be identified with permanently affixed labels with the wording “Service-Entrance Conductors.” The labels shall be located so as to be visible after installation with a spacing not to exceed 3 m (10 ft) so that the service-entrance conductors are able to be readily traced through the entire length of the cable tray.

Exception: Conductors, other than service-entrance conductors, shall be permitted to be installed in a cable tray with service-entrance conductors, provided a solid fixed barrier of a material compatible with the cable tray is installed to separate the service-entrance conductors from other conductors installed in the cable tray.

230.46 Spliced Conductors. Service-entrance conductors shall be permitted to be spliced or tapped in accordance with 110.14, 300.5(E), 300.13, and 300.15.

Splices must be in an enclosure or be direct buried using a listed underground splice kit. Splices are permitted where the cable enters a terminal box and a different wiring method, such as conduit, continues to the

service equipment. Tapped sets of conductors are commonly used to supply multiple service disconnecting means installed in separate enclosures as permitted by 230.71(A).

230.50 Protection Against Physical Damage.

(A) Underground Service-Entrance Conductors. Underground service-entrance conductors shall be protected against physical damage in accordance with 300.5.

(B) All Other Service-Entrance Conductors. All other service-entrance conductors, other than underground service entrance conductors, shall be protected against physical damage as specified in 230.50(B)(1) or (B)(2).

(1) Service-Entrance Cables. Service-entrance cables, where subject to physical damage, shall be protected by any of the following:

- (1) Rigid metal conduit (RMC)
- (2) Intermediate metal conduit (IMC)
- (3) Schedule 80 PVC conduit
- (4) Electrical metallic tubing (EMT)
- (5) Reinforced thermosetting resin conduit (RTRC)
- (6) Other approved means

(2) Other Than Service-Entrance Cables. Individual open conductors and cables, other than service-entrance cables, shall not be installed within 3.0 m (10 ft) of grade level or where exposed to physical damage.

Exception: Type MI and Type MC cable shall be permitted within 3.0 m (10 ft) of grade level where not exposed to physical damage or where protected in accordance with 300.5(D).

230.51 Mounting Supports. Service-entrance cables or individual open service-entrance conductors shall be supported as specified in 230.51(A), (B), or (C).

(A) Service-Entrance Cables. Service-entrance cables shall be supported by straps or other approved means within 300 mm (12 in.) of every service head, gooseneck, or connection to a raceway or enclosure and at intervals not exceeding 750 mm (30 in.).

(B) Other Cables. Cables that are not approved for mounting in contact with a building or other structure shall be mounted on insulating supports installed at intervals not exceeding 4.5 m (15 ft) and in a manner that maintains a clearance of not less than 50 mm (2 in.) from the surface over which they pass.

(C) Individual Open Conductors. Individual open conductors shall be installed in accordance with Table 230.51(C). Where exposed to the weather, the conductors shall be mounted on insulators or on insulating supports attached to racks, brackets, or other approved means. Where not exposed to the weather, the conductors shall be mounted on glass or porcelain knobs.

230.52 Individual Conductors Entering Buildings or Other Structures. Where individual open conductors enter a building or other structure, they shall enter through roof bushings or through the wall in an upward slant through individual, non-combustible, nonabsorbent insulating tubes. Drip loops shall be formed on the conductors before they enter the tubes.

230.53 Raceways to Drain. Where exposed to the weather, raceways enclosing service-entrance conductors shall be listed or approved for use in wet locations and arranged to drain. Where embedded in masonry, raceways shall be arranged to drain.

The objective is to prevent water from entering electrical equipment through the raceway system. Service raceways exposed to the weather must be "listed or approved," which allows discretion by the AHJ for products that are suitable for use in wet locations as well as recognizing listed products.

230.54 Overhead Service Locations.

(A) Service Head. Service raceways shall be equipped with a service head at the point of connection to service-drop or overhead service conductors. The service head shall be listed for use in wet locations.

(B) Service-Entrance Cables Equipped with Service Head or Gooseneck. Service-entrance cables shall be equipped with a service head. The service head shall be listed for use in wet locations.

TABLE 230.51(C) Supports

Maximum Volts	Maximum Distance Between Supports		Minimum Clearance			
			Between Conductors		From Surface	
	m	ft	mm	in.	mm	in.
1000	2.7	9	150	6	50	2
1000	4.5	15	300	12	50	2
300	1.4	4½	75	3	50	2
1000*	1.4*	4½*	65*	2½*	25*	1*

*Where not exposed to weather.

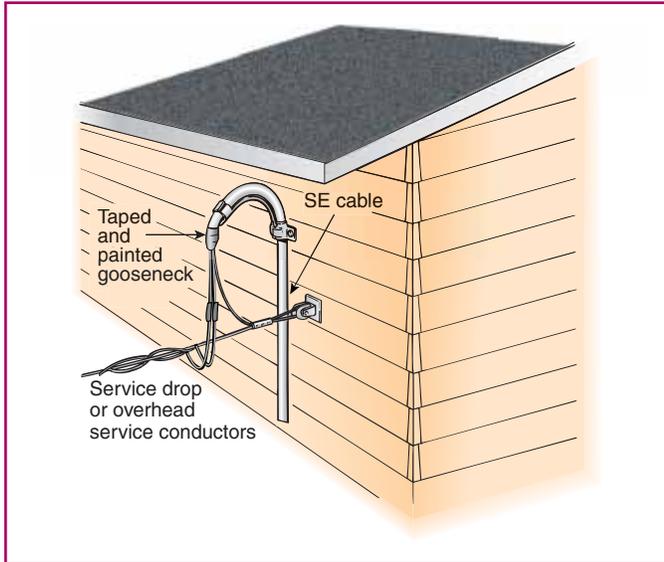

EXHIBIT 230.22 A service-entrance cable that terminates in a gooseneck without a raintight service head (weatherhead).

Exception: Type SE cable shall be permitted to be formed in a gooseneck and taped with a self-sealing weather-resistant thermoplastic.

Type SE service-entrance cables may be installed without a service head (weatherhead) if they are run continuously from a utility pole to metering or service equipment, or if they are shaped in a downward direction (forming a “gooseneck”) and sealed by taping and painting, as shown in Exhibit 230.22.

(C) Service Heads and Goosenecks Above Service-Drop or Overhead Service Attachment. Service heads on raceways or service-entrance cables and goosenecks in service-entrance cables shall be located above the point of attachment of the service-drop or overhead service conductors to the building or other structure.

Exception: Where it is impracticable to locate the service head or gooseneck above the point of attachment, the service head or gooseneck location shall be permitted not farther than 600 mm (24 in.) from the point of attachment.

(D) Secured. Service-entrance cables shall be held securely in place.

(E) Separately Bushed Openings. Service heads shall have conductors of different potential brought out through separately bushed openings.

Exception: For jacketed multiconductor service-entrance cable without splice.

(F) Drip Loops. Drip loops shall be formed on individual conductors. To prevent the entrance of moisture, service-entrance conductors shall be connected to the service-drop or overhead service conductors either (1) below the level of the service head

or (2) below the level of the termination of the service-entrance cable sheath.

(G) Arranged That Water Will Not Enter Service Raceway or Equipment. Service-entrance and overhead service conductors shall be arranged so that water will not enter service raceway or equipment.

230.56 Service Conductor with the Higher Voltage to Ground. On a 4-wire, delta-connected service where the mid-point of one phase winding is grounded, the service conductor having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color, or by other effective means, at each termination or junction point.

The special marking of the service conductor with the higher voltage to ground provides a warning of a potential hazard; connection to this higher voltage conductor can damage equipment or injure personnel. The marking should be at both the point of connection to the service-drop or lateral conductors and the point of connection to the service disconnecting means.

See also

110.15 and **408.3(E)** for similar “high-leg” marking and phase arrangement requirements

Part V. Service Equipment — General

230.62 Service Equipment — Enclosed or Guarded. Energized parts of service equipment shall be enclosed as specified in 230.62(A) or guarded as specified in 230.62(B).

(A) Enclosed. Energized parts shall be enclosed so that they will not be exposed to accidental contact or shall be guarded as in 230.62(B).

(B) Guarded. Energized parts that are not enclosed shall be installed on a switchboard, panelboard, or control board and guarded in accordance with 110.18 and 110.27. Where energized parts are guarded as provided in 110.27(A)(1) and (A)(2), a means for locking or sealing doors providing access to energized parts shall be provided.

230.66 Marking. Service equipment rated at 1000 volts or less shall be marked to identify it as being suitable for use as service equipment. All service equipment shall be listed or field labeled. Individual meter socket enclosures shall not be considered service equipment but shall be listed and rated for the voltage and ampacity of the service.

Exception: Meter sockets supplied by and under the exclusive control of an electric utility shall not be required to be listed.

“Suitable for Use as Service Equipment (SUSE)” is a common marking found on equipment that can be used at the service location. The marking indicates the equipment meets service equipment suitability requirements in the applicable product standard (i.e., panelboard, switchboard, enclosed switch, or other equipment product standard). “Suitable Only

for Use as Service Equipment” is a marking that indicates the grounded conductor or neutral terminal bus is not able to be electrically isolated from the metal equipment enclosure. This inability precludes most feeder applications for this equipment where the equipment grounding terminals and the grounded conductor terminals are required to be electrically isolated.

Part VI. Service Equipment — Disconnecting Means

230.70 General. Means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors.

(A) Location. The service disconnecting means shall be installed in accordance with 230.70(A)(1), (A)(2), and (A)(3).

No maximum distance between the point of entrance of service conductors to a readily accessible location for the installation of a service disconnecting means is specified by 230.70(A). The authority enforcing the *NEC* is responsible for the decision on how far inside the building the service-entrance conductors are allowed to travel to the service disconnecting means. The length of service-entrance conductors should be kept to a minimum inside buildings. There is an increased fire hazard because power utilities provide limited overcurrent protection. Some local jurisdictions specify a maximum length that service-entrance conductors may be run within the building before terminating at the disconnecting means.

If the AHJ determines the distance to be excessive, the disconnecting means may be required to be located on the outside of the building or near the building at a readily accessible location.

See also

230.6 and Exhibit 230.13 for conductors considered to be outside a building

(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure or inside nearest the point of entrance of the service conductors.

(2) Bathrooms. Service disconnecting means shall not be installed in bathrooms.

(3) Remote Control. Where a remote control device(s) is used to actuate the service disconnecting means, the service disconnecting means shall be located in accordance with 230.70(A)(1).

(B) Marking. Each service disconnect shall be permanently marked to identify it as a service disconnect.

(C) Suitable for Use. Each service disconnecting means shall be suitable for the prevailing conditions. Service equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

230.71 Maximum Number of Disconnects.

(A) General. The service disconnecting means for each service permitted by 230.2, or for each set of service-entrance conductors

permitted by 230.40, Exception No. 1, 3, 4, or 5, shall consist of not more than six switches or sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard or in switchgear. There shall be not more than six sets of disconnects per service grouped in any one location.

For the purpose of this section, disconnecting means installed as part of listed equipment and used solely for the following shall not be considered a service disconnecting means:

- (1) Power monitoring equipment
- (2) Surge-protective device(s)
- (3) Control circuit of the ground-fault protection system
- (4) Power-operable service disconnecting means

One set of service-entrance conductors is permitted to supply two to six service disconnecting means in lieu of a single main disconnect. Both single-occupancy and multiple-occupancy buildings can be provided with one main service disconnect or up to six main disconnects for each set of service-entrance conductors. Conductors from renewable energy sources, such as photovoltaic systems and wind generators, are feeder conductors.

See also

225.33 for the maximum number of disconnects for outside feeders
Article 705, which applies where alternative energy systems are run in parallel with a utility source

Multiple-occupancy buildings may have service-entrance conductors run to each occupancy, and each such set of service-entrance conductors may have from one to six disconnects (see 230.40, Exception No. 1) Exhibit 230.23 shows a single enclosure for grouping service equipment that consists of six circuit breakers or six fused switches. This

EXHIBIT 230.23 A service equipment enclosure that groups six service disconnecting means.

arrangement does not require a single main service disconnecting means. Six separate enclosures also would be permitted as the service disconnecting means. Some factory-installed switches that disconnect power to ancillary devices that are included as part of listed equipment do *not* count as one of the six service disconnecting means.

(B) Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with identified handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.

Informational Note: See 408.36, Exception No. 1 and Exception No. 3, for service equipment in certain panelboards, and see 430.95 for service equipment in motor control centers.

230.72 Grouping of Disconnects.

(A) General. The two to six disconnects as permitted in 230.71 shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six service disconnecting means permitted in 230.71, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means. If remotely installed in accordance with this exception, a plaque shall be posted at the location of the remaining grouped disconnects denoting its location.

The water pump in the exception is not the fire pump covered by the requirements of Article 695; rather, it is a water pump used for normal water supply and also for fire protection. This permits separation of the water pump disconnect so it can remain operational when the other service disconnecting means are opened.

(B) Additional Service Disconnecting Means. The one or more additional service disconnecting means for fire pumps, emergency systems, legally required standby, or optional standby services permitted by 230.2 shall be installed remote from the one to six service disconnecting means for normal service to minimize the possibility of simultaneous interruption of supply.

Reliability of power to important safety equipment or systems, such as fire pumps and building emergency power systems, is increased by locating the disconnecting means for such equipment remote from the normal service disconnecting means so that it is not exposed to a common impairment. This also protects against inadvertent opening of the disconnecting means. The AHJ is responsible for determining what is a sufficiently “remote” location for the additional service disconnecting means. Requirements in Articles 695 and 700 as well as in other standards such as NFPA 110, *Standard for Emergency and Standby Power Systems*, contain similar requirements that are focused on a high degree of reliability for power to safety equipment and systems. These disconnecting means are in addition to the one or more disconnecting means allowed for the normal supply.

(C) Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant’s service disconnecting means.

Exception: In a multiple-occupancy building where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

Unless electric service and maintenance are provided by and under continuous supervision of the building management, the occupants of a multiple-occupancy building must have ready access to their service disconnecting means, and this access has to be incorporated into the building service equipment layout or location.

See also

240.24(B) for a similar requirement for access to service, feeder, and branch-circuit OCPDs

230.74 Simultaneous Opening of Poles. Each service disconnect shall simultaneously disconnect all ungrounded service conductors that it controls from the premises wiring system.

230.75 Disconnection of Grounded Conductor. Where the service disconnecting means does not disconnect the grounded conductor from the premises wiring, other means shall be provided for this purpose in the service equipment. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose. In a multisection switchboard or switchgear, disconnects for the grounded conductor shall be permitted to be in any section of the switchboard or switchgear, if the switchboard or switchgear section is marked to indicate a grounded conductor disconnect is located within.

This disconnection does not have to be by operation of the service disconnecting means. Disconnection can be, and most commonly is, accomplished by manually removing the grounded conductor from the bus or terminal bar to which it is connected.

230.76 Manually or Power Operable. The service disconnecting means for ungrounded service conductors shall consist of one of the following:

- (1) A manually operable switch or circuit breaker equipped with a handle or other suitable operating means
- (2) A power-operated switch or circuit breaker, provided the switch or circuit breaker can be opened by hand in the event of a power supply failure

230.77 Indicating. The service disconnecting means shall plainly indicate whether it is in the open (off) or closed (on) position.

230.79 Rating of Service Disconnecting Means. The service disconnecting means shall have a rating not less than the calculated load to be carried, determined in accordance with **Part III, IV, or V** of **Article 220**, as applicable. In no case shall the rating be lower than specified in **230.79(A), (B), (C), or (D)**.

(A) One-Circuit Installations. For installations to supply only limited loads of a single branch circuit, the service disconnecting means shall have a rating of not less than 15 amperes.

(B) Two-Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, the service disconnecting means shall have a rating of not less than 30 amperes.

(C) One-Family Dwellings. For a one-family dwelling, the service disconnecting means shall have a rating of not less than 100 amperes, 3-wire.

(D) All Others. For all other installations, the service disconnecting means shall have a rating of not less than 60 amperes.

230.80 Combined Rating of Disconnects. Where the service disconnecting means consists of more than one switch or circuit breaker, as permitted by **230.71**, the combined ratings of all the switches or circuit breakers used shall not be less than the rating required by **230.79**.

230.81 Connection to Terminals. The service conductors shall be connected to the service disconnecting means by pressure connectors, clamps, or other approved means. Connections that depend on solder shall not be used.

230.82 Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:

- (1) Cable limiters or other current-limiting devices.

Cable limiters or other current-limiting devices are often applied ahead of the service disconnecting means for the following reasons:

1. To individually isolate faulted cable(s) from the remainder of the circuit or paralleled set of conductors
 2. To maintain continuity of service even though one or more cables are faulted
 3. To reduce the possibility of severe equipment damage or burn-down as a result of a fault on the service conductors
 4. To provide protection against high short-circuit currents for services and to provide compliance with **110.10**
- (2) Meters and meter sockets nominally rated not in excess of 1000 volts, if all metal housings and service enclosures are grounded in accordance with **Part VII** and bonded in accordance with **Part V** of **Article 250**.
 - (3) Meter disconnect switches nominally rated not in excess of 1000 V that have a short-circuit current rating equal to

or greater than the available short-circuit current, if all metal housings and service enclosures are grounded in accordance with **Part VII** and bonded in accordance with **Part V** of **Article 250**. A meter disconnect switch shall be capable of interrupting the load served. A meter disconnect shall be legibly field marked on its exterior in a manner suitable for the environment as follows:

METER DISCONNECT
NOT SERVICE EQUIPMENT

The meter disconnect is not the service disconnecting means. It is a load-break disconnect switch designed to interrupt the service load. The purpose of the meter disconnect switch is to facilitate meter change, maintenance, or disconnecting of the service. **Section 230.82(3)** requires meter disconnect switches to have a short-circuit current rating that is not less than the available short-circuit current at the line terminals of the meter disconnect switch.

CLOSER LOOK: Self-Contained Meters

Self-contained meters do not have external potential transformers or current transformers. The load current of the service travels through the meter itself. Neither the self-contained meter nor the meter bypass switch in the meter socket is designed to break the load current on a 480Y/277-volt system.

Self-contained meters or internal meter bypass switches should not be used to break the load current of a service having a voltage of over 150 volts to ground, because a hazardous arc could be generated. Arcs generated at voltages greater than 150 volts are considered self-sustaining and can transfer from the energized portions of the equipment to the grounded portions of the equipment.

An arc created while breaking load current on a 480Y/277-volt system (277 volts to ground) could transfer to the grounded equipment enclosure, creating a high-energy arcing ground fault and arc flash that could develop into a 3-phase short circuit. This hazardous arcing could burn down the meter socket and injure the person performing the work.

- (4) Instrument transformers (current and voltage), impedance shunts, load management devices, surge arresters, and Type 1 surge-protective devices.
- (5) Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors.

Emergency lighting, fire alarm systems, fire pumps, standby power, and sprinkler alarms are permitted to be connected ahead of the normal service disconnecting means only if such systems are provided with a separate disconnecting means and overcurrent protection.

- (6) Solar photovoltaic systems, fuel cell systems, wind electric systems, energy storage systems, or interconnected electric power production sources.

- (7) Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided.
- (8) Ground-fault protection systems or Type 2 surge-protective devices, where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided.
- (9) Connections used only to supply listed communications equipment under the exclusive control of the serving electric utility, if suitable overcurrent protection and disconnecting means are provided. For installations of equipment by the serving electric utility, a disconnecting means is not required if the supply is installed as part of a meter socket, such that access can only be gained with the meter removed.

Listed communications equipment includes equipment associated with Smart Grid applications (two-way communications between the premises electrical system and the supplying utility) and equipment associated with premises-powered broadband communication systems. Where building safety functions such as automatic or manual transmission of fire, security, medical, or 911 messages are dependent on premises-powered communications equipment, this permission to connect ahead of the service disconnecting means enhances the reliability of the power supply. Opening (turning off) of the service disconnecting means may occur for any number of reasons including planned shutdowns, building emergencies, or vandalism. Regardless of the reason, power for the communications system remains uninterrupted.

Part VII. Service Equipment — Overcurrent Protection

230.90 Where Required. Each ungrounded service conductor shall have overload protection.

Service equipment is the main control and means of cutoff of the electrical supply to the premises wiring system. It is usually an overcurrent device, such as a circuit breaker or a fuse, which is installed in series with each ungrounded service conductor to provide overload protection only.

The service overcurrent device does not protect the service conductors under short-circuit or ground-fault conditions on the line side of the disconnect. Protection against ground faults and short circuits is provided by the special requirements for service conductor protection and the location of the conductors.

(A) Ungrounded Conductor. Such protection shall be provided by an overcurrent device in series with each ungrounded service conductor that has a rating or setting not higher than the allowable ampacity of the conductor. A set of fuses shall be considered all the fuses required to protect all the ungrounded conductors of a circuit. Single-pole circuit breakers, grouped in accordance with 230.71(B), shall be considered as one protective device.

Exception No. 1: For motor-starting currents, ratings that comply with 430.52, 430.62, and 430.63 shall be permitted.

The service OCPD for a load that includes motors as well as lighting or a lighting and appliance load is subject to the motor-starting currents for all of the motors within a building. This exception allows the service OCPD to be sized using the requirements of Article 430 to accommodate the motor-starting and running current plus the other loads within the building. All of the building loads are determined in accordance with Article 220, and the service conductors and OCPD must be sized to carry that load. OCPDs for motor loads are permitted to have a rating or setting that exceeds the allowable ampacity of the circuit conductors. This exception extends that permission to the service OCPD.

See also

430.52 for the rating of an individual motor

430.62 for the rating of two or more motors

430.63 for the rating of a motor(s) load plus lighting and appliance load

Exception No. 2: Fuses and circuit breakers with a rating or setting that complies with 240.4(B) or (C) and 240.6 shall be permitted.

Where the conductor ampacity does not correspond to the standard ampere rating of a circuit breaker or fuse, this exception permits the next-larger standard size circuit breaker or fuse to be installed. The permission to “round up” is limited by 240.4(B)(3) to ratings not exceeding 800 amperes. This exception only permits rounding up to the next standard size fuse or circuit breaker rating and does not permit the load to exceed the allowable ampacity of the service conductors.

See also

240.6 for standard ampere ratings of fuses and circuit breakers

Exception No. 3: Two to six circuit breakers or sets of fuses shall be permitted as the overcurrent device to provide the overload protection. The sum of the ratings of the circuit breakers or fuses shall be permitted to exceed the ampacity of the service conductors, provided the calculated load does not exceed the ampacity of the service conductors.

Section 230.90 requires an overcurrent device to provide overload protection in each ungrounded service conductor. A single overcurrent device must have a rating or setting that is not higher than the allowable ampacity of the service conductors. However, Exception No. 3 to 230.90(A) allows not more than six circuit breakers or six sets of fuses to be considered the overcurrent device. None of these individual overcurrent devices can have a rating or setting higher than the ampacity of the service conductors.

In complying with these rules, it is possible for the total of the six overcurrent devices to be greater than the rating of the service-entrance conductors. However, the size of the service-entrance conductors is required to be adequate for the computed load only, and each individual service disconnecting means is required to be large enough for the individual load it supplies.

The combined ratings of the five OCPDs (350 amperes) shown in Exhibit 230.24 exceed the ampacity of the service-entrance conductors (310 amperes) that is permitted by this exception. As specified, the ampacity of the service-entrance conductors is sufficient to carry

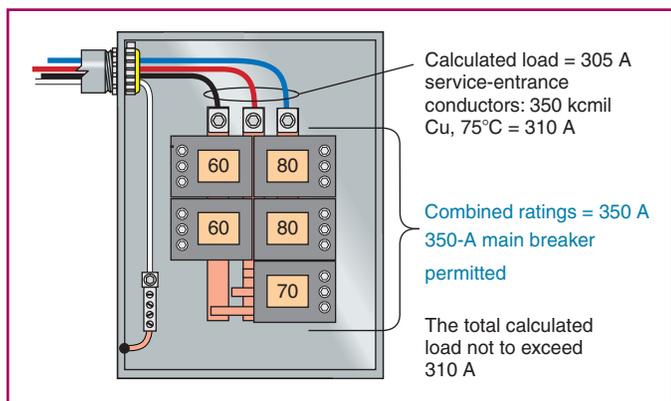

EXHIBIT 230.24 An example in which the combined ratings of the five overcurrent devices are permitted to exceed the ampacity of the service conductors.

the calculated load. The combined rating of the five service disconnecting means also complies with 230.80, which requires that the combined rating (350 amperes) be not less than the calculated load (305 amperes), the minimum size required for the service OCPD specified by 240.4 and 230.80. In addition, the rating of the equipment (panelboard) in which the five OCPDs or service disconnecting means are installed cannot be less than the calculated load in accordance with the requirements of 408.30.

Exception No. 4: Overload protection for fire pump supply conductors shall comply with 695.4(B)(2)(a).

Exception No. 5: Overload protection for 120/240-volt, 3-wire, single-phase dwelling services shall be permitted in accordance with the requirements of 310.15(B)(7).

(B) Not in Grounded Conductor. No overcurrent device shall be inserted in a grounded service conductor except a circuit breaker that simultaneously opens all conductors of the circuit.

230.91 Location. The service overcurrent device shall be an integral part of the service disconnecting means or shall be located immediately adjacent thereto. Where fuses are used as the service overcurrent device, the disconnecting means shall be located ahead of the supply side of the fuses.

230.92 Locked Service Overcurrent Devices. Where the service overcurrent devices are locked or sealed or are not readily accessible to the occupant, branch-circuit or feeder overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of lower ampere rating than the service overcurrent device.

230.93 Protection of Specific Circuits. Where necessary to prevent tampering, an automatic overcurrent device that protects service conductors supplying only a specific load, such as a water

heater, shall be permitted to be locked or sealed where located so as to be accessible.

230.94 Relative Location of Overcurrent Device and Other Service Equipment. The overcurrent device shall protect all circuits and devices.

Exception No. 1: The service switch shall be permitted on the supply side.

Exception No. 2: High-impedance shunt circuits, surge arresters, Type 1 surge-protective devices, surge-protective capacitors, and instrument transformers (current and voltage) shall be permitted to be connected and installed on the supply side of the service disconnecting means as permitted by 230.82.

Exception No. 3: Circuits for load management devices shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection.

Exception No. 4: Circuits used only for the operation of fire alarm, other protective signaling systems, or the supply to fire pump equipment shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection.

Exception No. 5: Meters nominally rated not in excess of 600 volts shall be permitted, provided all metal housings and service enclosures are grounded.

Exception No. 6: Where service equipment is power operable, the control circuit shall be permitted to be connected ahead of the service equipment if suitable overcurrent protection and disconnecting means are provided.

230.95 Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided for solidly grounded wye electric services of more than 150 volts to ground but not exceeding 1000 volts phase-to-phase for each service disconnect rated 1000 amperes or more. The grounded conductor for the solidly grounded wye system shall be connected directly to ground through a grounding electrode system, as specified in 250.50, without inserting any resistor or impedance device.

The rating of the service disconnect shall be considered to be the rating of the largest fuse that can be installed or the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted.

Ground-fault protection of equipment (GFPE) for service disconnecting means was first required in the 1971 edition of the NEC due to the unusually high number of equipment burndowns reported on large capacity 480Y/277-volt solidly grounded services. See the definition of ground-fault protection of equipment in Article 100. Other solidly grounded, wye-connected systems (i.e., 600Y/347 volts) are covered within the parameters specified by this section. This requirement does

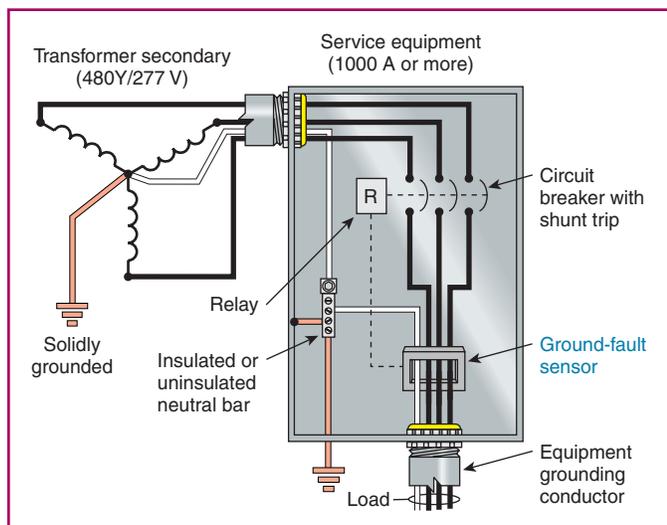

EXHIBIT 230.25 A ground-fault sensor encircling all circuit conductors, including the neutral.

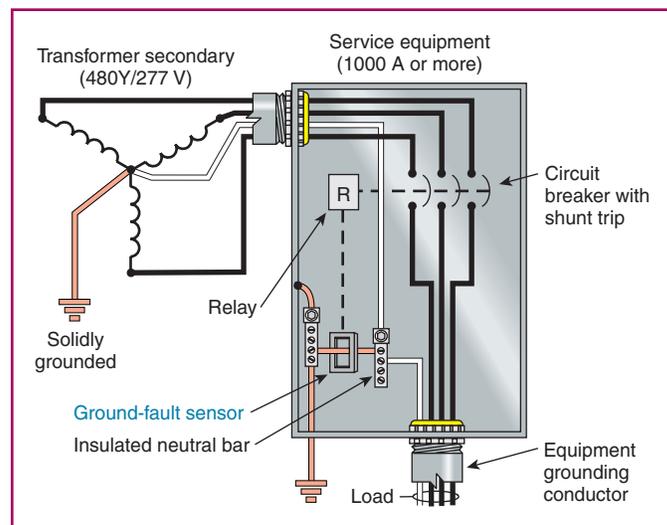

EXHIBIT 230.26 A ground-fault sensor encircling only the bonding jumper conductor.

not apply to systems where the grounded conductor is not solidly grounded, as is the case with high-impedance grounded neutral systems covered in 250.36.

Ground-fault protection of services does not protect the conductors on the supply side of the service disconnecting means, but it is designed to provide protection from line-to-ground faults that occur on the load side of the service disconnecting means.

The two basic types of ground-fault equipment protectors are illustrated in Exhibits 230.25 and 230.26. In Exhibit 230.25, the ground-fault sensor is installed around all the circuit conductors and a stray current on a line-to-ground fault sets up an imbalance of the currents flowing in individual conductors installed through the ground-fault sensor. When this current exceeds the setting of the ground-fault sensor, the shunt trip operates and opens the circuit breakers.

The ground-fault sensor illustrated in Exhibit 230.26 is installed around the bonding jumper only. When an unbalanced current from a line-to-ground fault occurs, the current flows through the bonding jumper and the shunt trip causes the circuit breaker to operate, removing the load from the line.

See also

250.24(A)(4), which permits a grounding electrode conductor connection to the equipment grounding terminal bar or bus

Exception: The ground-fault protection provisions of this section shall not apply to a service disconnect for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards.

Unplanned interruption of power to some industrial processes results in a life-safety or catastrophic-failure hazards more significant than the electrical hazard mitigated by this requirement. In addition, 695.6(G) prohibits fire pumps from being protected by GFPE-type devices. The use of high-impedance grounded neutral systems as covered in 250.36 is a means to maintain continuity of power where the

supply system is 3-phase, 4-wire, wye-connected and no line-to-neutral loads are supplied.

(A) Setting. The ground-fault protection system shall operate to cause the service disconnect to open all ungrounded conductors of the faulted circuit. The maximum setting of the ground-fault protection shall be 1200 amperes, and the maximum time delay shall be one second for ground-fault currents equal to or greater than 3000 amperes.

Ground-fault sensors have a maximum setting of 1200 amperes and no minimum. Settings at low levels can increase the likelihood of unwanted shutdowns. The duration of the fault is limited to not more than 1 second for fault currents greater than 3000 amperes. This restriction minimizes the amount of damage done by an arcing fault, which is directly proportional to the time the arcing fault is allowed to burn.

Care should be taken to ensure that interconnecting multiple supply systems does not interfere with proper sensing by the ground-fault protection equipment (GFPE). A careful engineering study must be made to ensure that fault currents do not take parallel paths to the supply system, thereby bypassing the ground-fault detection device.

See also

215.10, 240.13, 517.17, and 705.32 for further requirements covering GFPE

(B) Fuses. If a switch and fuse combination is used, the fuses employed shall be capable of interrupting any current higher than the interrupting capacity of the switch during a time that the ground-fault protective system will not cause the switch to open.

(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. This testing shall be conducted by a qualified person(s) using a test process of primary current injection, in accordance with instructions

that shall be provided with the equipment. A written record of this testing shall be made and shall be available to the authority having jurisdiction.

Informational Note No. 1: Ground-fault protection that functions to open the service disconnect affords no protection from faults on the line side of the protective element. It serves only to limit damage to conductors and equipment on the load side in the event of an arcing ground fault on the load side of the protective element.

Informational Note No. 2: This added protective equipment at the service equipment may make it necessary to review the overall wiring system for proper selective overcurrent protection coordination. Additional installations of ground-fault protective equipment may be needed on feeders and branch circuits where maximum continuity of electric service is necessary.

Informational Note No. 3: Where ground-fault protection is provided for the service disconnect and interconnection is made with another supply system by a transfer device, means or devices may be needed to ensure proper ground-fault sensing by the ground-fault protection equipment.

Informational Note No. 4: See 517.17(A) for information on where an additional step of ground-fault protection is required for hospitals and other buildings with critical areas or life support equipment.

Performance testing of the ground-fault protection system is vital for newly installed electrical equipment to ensure proper system operation. A test process of primary current injection will test the system, including the electronics of the relay or trip unit, and ensure the current transformer installation and wiring are correct.

Part VIII. Services Exceeding 1000 Volts, Nominal

230.200 General. Service conductors and equipment used on circuits exceeding 1000 volts, nominal, shall comply with all the applicable provisions of the preceding sections of this article and with the following sections that supplement or modify the preceding sections. In no case shall the provisions of **Part VIII** apply to equipment on the supply side of the service point.

Informational Note: For clearances of conductors of over 1000 volts, nominal, see ANSI/IEEE C2-2012, *National Electrical Safety Code*.

Only those conductors on the load side of the service-point connection are subject to the requirements of the *NEC*. The service point is a specific location where the supply conductors of the electric utility and the customer-owned (premises wiring) conductors connect.

Exhibit 230.27 depicts an installation where the transformer and service lateral to the service point are owned by the electric utility. The transformer secondary conductors between the service point (separate connection point outside of the transformer in this scenario) and the service disconnecting means at the building are *underground service conductors* until the point at which they enter the building. From that point to the termination in the service equipment they are *service-entrance conductors*.

In the installation depicted in **Exhibit 230.28**, the service disconnecting means is located at the customer-owned transformer primary. The conductors that connect the service point (at the top of the pole),

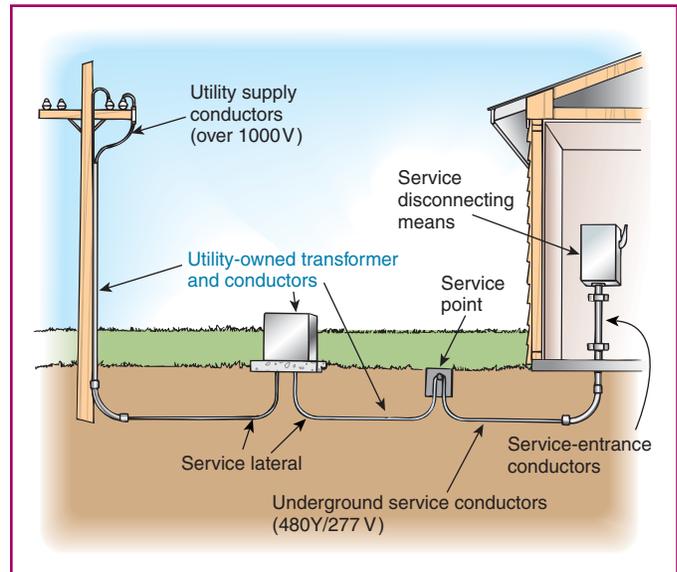

EXHIBIT 230.27 Service rated over 1000 volts supplied by a utility-owned transformer.

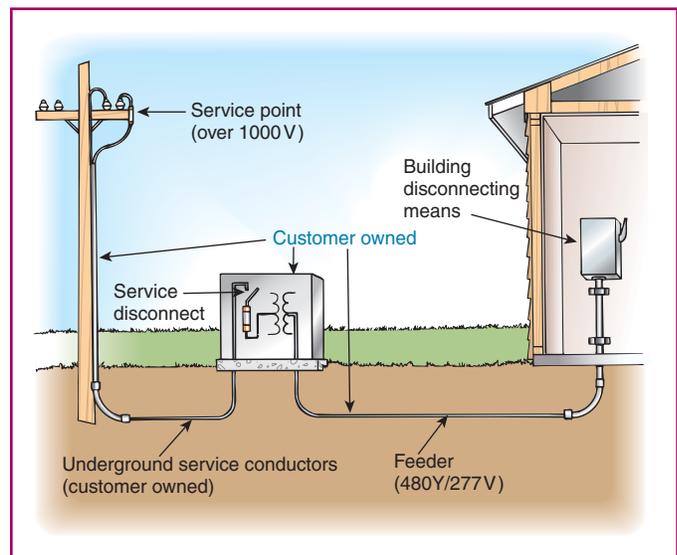

EXHIBIT 230.28 Service rated over 1000 volts supplying a customer-owned transformer.

the service disconnecting means, and the service/transformer OCPD are underground service conductors. The conductors between the transformer secondary and the line side of the building disconnecting means are *feeders* and are subject to the requirements in 240.21(C)(4) for outside conductors connected to a transformer secondary. Conductors (not shown) on the load side of the building disconnecting means are also feeders. Each building or structure is required to have a disconnecting means, in accordance with 225.31.

230.202 Service-Entrance Conductors. Service-entrance conductors to buildings or enclosures shall be installed to conform to 230.202(A) and (B).

(A) Conductor Size. Service-entrance conductors shall not be smaller than 6 AWG unless in multiconductor cable. Multiconductor cable shall not be smaller than 8 AWG.

(B) Wiring Methods. Service-entrance conductors shall be installed by one of the wiring methods covered in 300.37 and 300.50.

230.204 Isolating Switches.

(A) Where Required. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute the service disconnecting means, an isolating switch with visible break contacts shall be installed on the supply side of the disconnecting means and all associated service equipment.

Exception: An isolating switch shall not be required where the circuit breaker or switch is mounted on removable truck panels or switchgear units where both of the following conditions apply:

- (1) Cannot be opened unless the circuit is disconnected
- (2) Where all energized parts are automatically disconnected when the circuit breaker or switch is removed from the normal operating position

(B) Fuses as Isolating Switch. Where fuses are of the type that can be operated as a disconnecting switch, a set of such fuses shall be permitted as the isolating switch.

(C) Accessible to Qualified Persons Only. The isolating switch shall be accessible to qualified persons only.

(D) Connection to Ground. Isolating switches shall be provided with a means for readily connecting the load side conductors to a grounding electrode system, equipment ground busbar, or grounded steel structure when disconnected from the source of supply.

A means for grounding the load side conductors to a grounding electrode system, equipment grounding busbar, or grounded structural steel shall not be required for any duplicate isolating switch installed and maintained by the electric supply company.

230.205 Disconnecting Means.

(A) Location. The service disconnecting means shall be located in accordance with 230.70.

For either overhead or underground primary distribution systems on private property, the service disconnect shall be permitted to be located in a location that is not readily accessible, if the disconnecting means can be operated by mechanical linkage from a readily accessible point, or electronically in accordance with 230.205(C), where applicable.

The general requirement for service disconnecting means in systems rated over 1000 volts is that it be readily accessible. Because this ready access may not be possible or desirable (since it could put employees at risk), the use of a readily accessible operating mechanism or of an electronic switching device are acceptable alternatives.

(B) Type. Each service disconnect shall simultaneously disconnect all ungrounded service conductors that it controls and shall have a fault-closing rating that is not less than the maximum short-circuit current available at its supply terminals.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault-closing rating of the disconnecting means.

(C) Remote Control. For multibuilding, industrial installations under single management, the service disconnecting means shall be permitted to be located at a separate building or structure. In such cases, the service disconnecting means shall be permitted to be electrically operated by a readily accessible, remote-control device.

230.206 Overcurrent Devices as Disconnecting Means. Where the circuit breaker or alternative for it, as specified in 230.208 for service overcurrent devices, meets the requirements specified in 230.205, it shall constitute the service disconnecting means.

230.208 Protection Requirements. A short-circuit protective device shall be provided on the load side of, or as an integral part of, the service disconnect, and shall protect all ungrounded conductors that it supplies. The protective device shall be capable of detecting and interrupting all values of current, in excess of its trip setting or melting point, that can occur at its location. A fuse rated in continuous amperes not to exceed three times the ampacity of the conductor, or a circuit breaker with a trip setting of not more than six times the ampacity of the conductors, shall be considered as providing the required short-circuit protection.

Informational Note: See Table 310.60(C)(67) through Table 310.60(C)(86) for ampacities of conductors rated 2001 volts and above.

Overcurrent devices shall conform to 230.208(A) and (B).

(A) Equipment Type. Equipment used to protect service-entrance conductors shall meet the requirements of Article 490, Part II.

(B) Enclosed Overcurrent Devices. The restriction to 80 percent of the rating for an enclosed overcurrent device for continuous loads shall not apply to overcurrent devices installed in systems operating at over 1000 volts.

230.209 Surge Arresters. Surge arresters installed in accordance with the requirements of Article 280 shall be permitted on each ungrounded overhead service conductor.

Informational Note: Surge arresters may be referred to as lightning arresters in older documents.

230.210 Service Equipment — General Provisions. Service equipment, including instrument transformers, shall conform to Article 490, Part I.

230.211 Switchgear. Switchgear shall consist of a substantial metal structure and a sheet metal enclosure. Where installed over a combustible floor, suitable protection thereto shall be provided.

EXHIBIT 230.29 Assembly of metal-enclosed switchgear. (Courtesy of Schneider Electric)

Exhibit 230.29 is an example of an enclosed switchgear assembly covered by 230.211. Switchgear can be used in lieu of a vault in accordance with 230.212.

230.212 Over 35,000 Volts. Where the voltage exceeds 35,000 volts between conductors that enter a building, they shall terminate in a switchgear compartment or a vault conforming to the requirements of 450.41 through 450.48.

Part I. General

240.1 Scope. Parts I through VII of this article provide the general requirements for overcurrent protection and overcurrent protective devices not more than 1000 volts, nominal. Part VIII covers overcurrent protection for those portions of supervised industrial installations operating at voltages of not more than 1000 volts, nominal. Part IX covers overcurrent protection over 1000 volts, nominal.

Informational Note: Overcurrent protection for conductors and equipment is provided to open the circuit if the current reaches a value that will cause an excessive or dangerous temperature in conductors or conductor insulation. See also 110.9 for requirements for interrupting ratings and 110.10 for requirements for protection against fault currents.

240.2 Definitions.

Current-Limiting Overcurrent Protective Device. A device that, when interrupting currents in its current-limiting range, reduces the current flowing in the faulted circuit to a magnitude substantially less than that obtainable in the same circuit if the device were replaced with a solid conductor having comparable impedance.

A current-limiting protective device is one that cuts off a fault current in less than one-half cycle, thus preventing short-circuit currents from building up to their full available values. Most electrical distribution systems can deliver high ground-fault or short-circuit currents to components such as conductors and service equipment. These components may be damaged or destroyed by high fault currents, resulting in serious burndowns and fires. Properly selected current-limiting OCPDs, such as the ones shown in Exhibit 240.1, limit the let-through energy to an amount that does not exceed the rating of the components in spite of high available short-circuit currents.

Supervised Industrial Installation. For the purposes of Part VIII, the industrial portions of a facility where all of the following conditions are met:

- (1) Conditions of maintenance and engineering supervision ensure that only qualified persons monitor and service the system.
- (2) The premises wiring system has 2500 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220.

EXHIBIT 240.1 Class R current-limiting fuses with rejection feature to prohibit the installation of non-current-limiting fuses. (Courtesy of Eaton, Bussmann Division)

- (3) The premises has at least one service or feeder that is more than 150 volts to ground and more than 300 volts phase-to-phase.

This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center.

All process or manufacturing loads from each low-, medium-, and high voltage system can be added together to satisfy the load requirement. Loads not associated with manufacturing or processing cannot be used to meet the 2500-kilovolt-ampere minimum requirement. Loads are calculated in accordance with Article 220. Part VIII does not apply to electrical systems operating at over 1000 volts, nominal, or to electrical systems that serve separate facilities — such as offices, warehouses, garages, machine shops, or recreational buildings — that are not a part of the manufacturing or industrial process.

Tap Conductor. A conductor, other than a service conductor, that has overcurrent protection ahead of its point of supply that exceeds the value permitted for similar conductors that are protected as described elsewhere in 240.4.

Tap conductors are branch-circuit and feeder conductors subject to the conditional overcurrent protection requirements specified in 240.21. The general requirement in 240.21 is for conductor overcurrent protection to be provided at the point a conductor is supplied. Section 240.21 allows for the installation of branch-circuit and feeder conductors that are protected against overcurrent using an OCPD downstream of the point of supply. Short-circuit and ground-fault protection is provided upstream of the tap.

Exhibit 240.2 illustrates a 1/0 AWG, Type THW copper conductor [150 amperes, from Table 310.15(B)(16)] connected to a 3/0 AWG, Type THW copper feeder conductor with an ampacity of 200 amperes

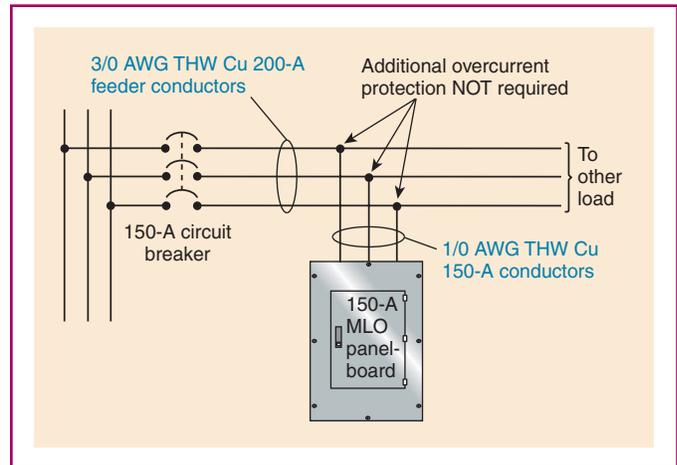

EXHIBIT 240.2 An example in which the sets of 1/0 AWG and the 3/0 AWG conductors are both protected by the 150-ampere circuit breaker.

(increased in size to compensate for voltage drop) that is protected by a 150-ampere OCPD. Because the ampacity of the 1/0 AWG conductor is not exceeded by the rating of the overcurrent device, the 1/0 AWG conductor is not considered to be a tap conductor. The overcurrent device protects both the 1/0 AWG and the 3/0 AWG conductors in accordance with the basic rule of 240.4, and additional overcurrent protection is not required at the supply or termination point of the 1/0 AWG conductors.

240.3 Other Articles. Equipment shall be protected against overcurrent in accordance with the article in this Code that covers the type of equipment specified in Table 240.3.

240.4 Protection of Conductors Conductors, other than flexible cords, flexible cables, and fixture wires, shall be protected against overcurrent in accordance with their ampacities specified in 310.15, unless otherwise permitted or required in 240.4(A) through (G).

Informational Note: See ICEA P-32-382-2007 for information on allowable short-circuit currents for insulated copper and aluminum conductors.

(A) Power Loss Hazard. Conductor overload protection shall not be required where the interruption of the circuit would create a hazard, such as in a material-handling magnet circuit or fire pump circuit. Short-circuit protection shall be provided.

Informational Note: See NFPA 20-2013, *Standard for the Installation of Stationary Pumps for Fire Protection*.

A refinery is an example of a facility in which interruption of some processes could pose a significant hazard.

(B) Overcurrent Devices Rated 800 Amperes or Less. The next higher standard overcurrent device rating (above the ampacity of the conductors being protected) shall be permitted to be used, provided all of the following conditions are met:

- (1) The conductors being protected are not part of a branch circuit supplying more than one receptacle for cord-and-plug-connected portable loads.

- (2) The ampacity of the conductors does not correspond with the standard ampere rating of a fuse or a circuit breaker without overload trip adjustments above its rating (but that shall be permitted to have other trip or rating adjustments).
- (3) The next higher standard rating selected does not exceed 800 amperes.

Table 240.6(A) lists the standard ratings of overcurrent devices. Where the ampacity of the conductor specified in Article 310 does not match the rating of the standard overcurrent device, 240.4(B) permits the use of the next larger standard overcurrent device. All three conditions must be met for this permission to apply. For example, in Table 310.15(B)(16), the ampacity for 3 AWG, 75°C copper, Type THWN, is listed as 100 amperes.

That conductor would have to be protected by an OCPD rated not more than 100 amperes unless otherwise permitted in 240.4(E), (F), or (G).

Section 240.4(B) does not modify or change the allowable ampacity of the conductor — it only serves to provide a reasonable increase in the permitted OCPD rating where the allowable ampacity and the standard OCPD ratings do not correspond.

For example, a 500-kcmil THWN copper conductor has an allowable ampacity of 380 amperes, specified in Table 310.15(B)(16). This conductor can supply a load not exceeding 380 amperes and, in accordance with 240.4(B), can be protected by a 400-ampere OCPD.

Section 310.15(B)(7) permits the conductor types and sizes specified in that section to supply calculated loads based on the ratings specified. The service and main power feeder loads permitted to be supplied by the conductor types and sizes covered in 310.15(B)(7) exceed the conductor ampacities for the same conductor types and sizes specified in Table 310.15(B)(16). The overcurrent protection for these residential supply conductors is also permitted to be based on the increased rating allowed by 310.15(B)(7). Application of 310.15(B)(7) is permitted only for single-phase, 120/240-volt, residential services and main power feeders. The increased ratings given in 310.15(B)(7) are based on the significant diversity inherent to most dwelling unit loads and the fact that only the two ungrounded service or feeder conductors are considered to be current carrying.

See also

Example D7 in Annex D for a table of conductor sizes for feeders and services based on the application of the formula in 310.15(B)(7)

(C) Overcurrent Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than the rating of the overcurrent device defined in 240.6

(D) Small Conductors. Unless specifically permitted in 240.4(E) or (G), the overcurrent protection shall not exceed that required by (D)(1) through (D)(7) after any correction factors for ambient temperature and number of conductors have been applied.

(1) 18 AWG Copper. 7 amperes, provided all the following conditions are met:

- (1) Continuous loads do not exceed 5.6 amperes.
- (2) Overcurrent protection is provided by one of the following:
 - a. Branch-circuit-rated circuit breakers listed and marked for use with 18 AWG copper wire
 - b. Branch-circuit-rated fuses listed and marked for use with 18 AWG copper wire
 - c. Class CC, Class J, or Class T fuses

(2) 16 AWG Copper. 10 amperes, provided all the following conditions are met:

- (1) Continuous loads do not exceed 8 amperes.
- (2) Overcurrent protection is provided by one of the following:
 - a. Branch-circuit-rated circuit breakers listed and marked for use with 16 AWG copper wire
 - b. Branch-circuit-rated fuses listed and marked for use with 16 AWG copper wire
 - c. Class CC, Class J, or Class T fuses

(3) **14 AWG Copper.** 15 amperes

(4) **12 AWG Aluminum and Copper-Clad Aluminum.** 15 amperes

(5) **12 AWG Copper.** 20 amperes

(6) **10 AWG Aluminum and Copper-Clad Aluminum.** 25 amperes

(7) **10 AWG Copper.** 30 amperes

(E) Tap Conductors. Tap conductors shall be permitted to be protected against overcurrent in accordance with the following:

- (1) 210.19(A)(3) and (A)(4), Household Ranges and Cooking Appliances and Other Loads
- (2) 240.5(B)(2), Fixture Wire
- (3) 240.21, Location in Circuit
- (4) 368.17(B), Reduction in Ampacity Size of Busway
- (5) 368.17(C), Feeder or Branch Circuits (busway taps)
- (6) 430.53(D), Single Motor Taps

(F) Transformer Secondary Conductors. Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors shall not be considered to be protected by the primary overcurrent protective device. Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, or a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 450.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.

Transformer secondary conductors must be protected by the use of overcurrent devices, because the primary overcurrent devices do not provide such protection.

See also

240.21(C) and its commentary for more information

(G) Overcurrent Protection for Specific Conductor Applications. Overcurrent protection for the specific conductors shall be permitted to be provided as referenced in Table 240.4(G).

240.5 Protection of Flexible Cords, Flexible Cables, and Fixture Wires. Flexible cord and flexible cable, including tinsel cord and extension cords, and fixture wires shall be protected against overcurrent by either 240.5(A) or (B).

(A) Ampacities. Flexible cord and flexible cable shall be protected by an overcurrent device in accordance with their ampacity as specified in Table 400.5(A)(1) and Table 400.5(A)(2). Fixture wire shall be protected against overcurrent in accordance with its ampacity as specified in Table 402.5. Supplementary overcurrent protection, as covered in 240.10, shall be permitted to be an acceptable means for providing this protection.

TABLE 240.4(G) Specific Conductor Applications

Conductor	Article	Section
Air-conditioning and refrigeration equipment circuit conductors	440, Parts III, VI	
Capacitor circuit conductors	460	460.8(B) and 460.25(A)–(D)
Control and instrumentation circuit conductors (Type ITC)	727	727.9
Electric welder circuit conductors	630	630.12 and 630.32
Fire alarm system circuit conductors	760	760.43, 760.45, 760.121, and Chapter 9, Tables 12(A) and 12(B)
Motor-operated appliance circuit conductors	422, Part II	
Motor and motor-control circuit conductors	430, Parts II, III, IV, V, VI, VII

Secondary tie conductors	450	450.6

(B) Branch-Circuit Overcurrent Device. Flexible cord shall be protected, where supplied by a branch circuit, in accordance with one of the methods described in 240.5(B)(1), (B)(3), or (B)(4). Fixture wire shall be protected, where supplied by a branch circuit, in accordance with 240.5(B)(2).

(1) Supply Cord of Listed Appliance or Luminaire. Where flexible cord or tinsel cord is approved for and used with a specific listed appliance or luminaire, it shall be considered to be protected when applied within the appliance or luminaire listing requirements. For the purposes of this section, a luminaire may be either portable or permanent.

A flexible cord connected to a listed appliance or portable lamp or used in a listed extension cord set is considered to be protected by the branch-circuit OCPD as long as the appliance, lamp, or extension cord is used in accordance with its listing requirements.

(2) Fixture Wire. Fixture wire shall be permitted to be tapped to the branch-circuit conductor of a branch circuit in accordance with the following:

- (1) 20-ampere circuits — 18 AWG, up to 15 m (50 ft) of run length
- (2) 20-ampere circuits — 16 AWG, up to 30 m (100 ft) of run length
- (3) 20-ampere circuits — 14 AWG and larger
- (4) 30-ampere circuits — 14 AWG and larger

- (5) 40-ampere circuits — 12 AWG and larger
- (6) 50-ampere circuits — 12 AWG and larger

(3) Extension Cord Sets. Flexible cord used in listed extension cord sets shall be considered to be protected when applied within the extension cord listing requirements.

(4) Field Assembled Extension Cord Sets. Flexible cord used in extension cords made with separately listed and installed components shall be permitted to be supplied by a branch circuit in accordance with the following:

20-ampere circuits — 16 AWG and larger

240.6 Standard Ampere Ratings.

(A) Fuses and Fixed-Trip Circuit Breakers. The standard ampere ratings for fuses and inverse time circuit breakers shall be considered as shown in [Table 240.6\(A\)](#). Additional standard ampere ratings for fuses shall be 1, 3, 6, 10, and 601. The use of fuses and inverse time circuit breakers with nonstandard ampere ratings shall be permitted.

N TABLE 240.6(A) Standard Ampere Ratings for Fuses and Inverse Time Circuit Breakers

Standard Ampere Ratings				
15	20	25	30	35
40	45	50	60	70
80	90	100	110	125
150	175	200	225	250
300	350	400	450	500
600	700	800	1000	1200
1600	2000	2500	3000	4000
5000	6000	—	—	—

(B) Adjustable-Trip Circuit Breakers. The rating of adjustable-trip circuit breakers having external means for adjusting the current setting (long-time pickup setting), not meeting the requirements of [240.6\(C\)](#), shall be the maximum setting possible.

(C) Restricted Access Adjustable-Trip Circuit Breakers. A circuit breaker(s) that has restricted access to the adjusting means shall be permitted to have an ampere rating(s) that is equal to the adjusted current setting (long-time pickup setting). Restricted access shall be defined as located behind one of the following:

- (1) Removable and sealable covers over the adjusting means
- (2) Bolted equipment enclosure doors
- (3) Locked doors accessible only to qualified personnel

The set long-time pickup rating of an adjustable-trip circuit breaker is permitted to be considered the circuit-breaker rating where access to the adjustment means is limited. This access limitation can be provided by locating the adjustment means behind sealable covers, as shown in [Exhibit 240.3](#). The purpose of limiting access to the adjustment prevents tampering or readjustment by unqualified personnel.

240.8 Fuses or Circuit Breakers in Parallel. Fuses and circuit breakers shall be permitted to be connected in parallel where they

EXHIBIT 240.3 An adjustable-trip circuit breaker with a transparent, removable, and sealable cover. (Courtesy of Square D by Schneider Electric)

are factory assembled in parallel and listed as a unit. Individual fuses, circuit breakers, or combinations thereof shall not otherwise be connected in parallel.

240.9 Thermal Devices. Thermal relays and other devices not designed to open short circuits or ground faults shall not be used for the protection of conductors against overcurrent due to short circuits or ground faults, but the use of such devices shall be permitted to protect motor branch-circuit conductors from overload if protected in accordance with [430.40](#).

240.10 Supplementary Overcurrent Protection. Where supplementary overcurrent protection is used for luminaires, appliances, and other equipment or for internal circuits and components of equipment, it shall not be used as a substitute for required branch-circuit overcurrent devices or in place of the required branch-circuit protection. Supplementary overcurrent devices shall not be required to be readily accessible.

240.12 Electrical System Coordination. Where an orderly shutdown is required to minimize the hazard(s) to personnel and

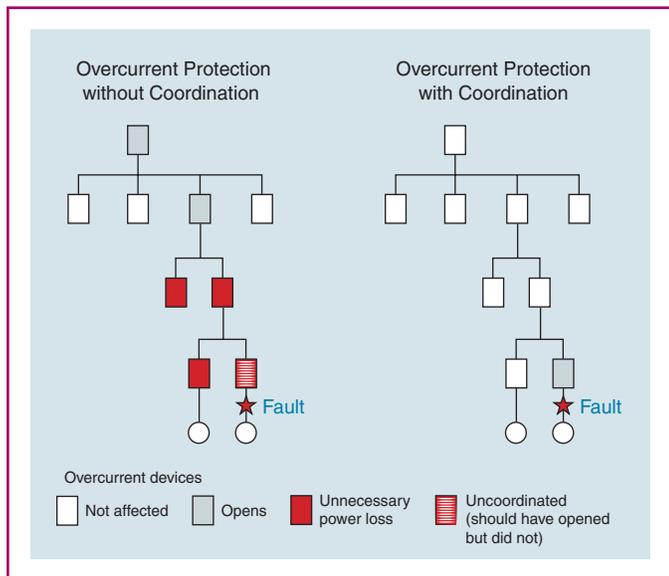

EXHIBIT 240.4 Overcurrent protection schemes without system coordination and with system coordination.

equipment, a system of coordination based on the following two conditions shall be permitted:

- (1) Coordinated short-circuit protection
- (2) Overload indication based on monitoring systems or devices

Informational Note: The monitoring system may cause the condition to go to alarm, allowing corrective action or an orderly shutdown, thereby minimizing personnel hazard and equipment damage.

With coordinated overcurrent protection, the faulted or overloaded circuit is isolated by the selective operation of only the OCPD closest to the overcurrent condition. This selective operation prevents power loss to unaffected loads. Coordinated short-circuit protection will automatically open the circuit by localizing and de-energizing the faulted portion of the circuit, but an overload condition is not required to result in automatic opening of a protective device. Instead, an alarm can be used to warn of the overload condition, and remedial action can be taken.

In some circumstances, an orderly shutdown of a system or process is more critical to personnel and equipment safety than is the automatic operation of the OCPD in response to an overload. Selective coordination requirements for specific systems or equipment are contained in 620.62, 645.27, 695.3(C)(3), 700.32, 701.27, and 708.54. Examples of overcurrent protection with and without coordinated protection are illustrated in Exhibit 240.4.

240.13 Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided in accordance with the provisions of 230.95 for solidly grounded wye electrical systems of more than 150 volts to ground but not exceeding 1000 volts phase-to-phase for each individual device used as a building or structure main disconnecting means rated 1000 amperes or more.

The provisions of this section shall not apply to the disconnecting means for the following:

- (1) Continuous industrial processes where a nonorderly shutdown will introduce additional or increased hazards
- (2) Installations where ground-fault protection is provided by other requirements for services or feeders
- (3) Fire pumps

Section 240.13 extends the requirement of 230.95 to building disconnects, regardless of whether they are classified as service disconnects, building disconnects for feeders, or even branch circuits.

Where ground-fault protection for equipment is installed at the service equipment, and feeders or branch circuits are installed from that service to supply other buildings or structures, the disconnecting means at any subsequent building is not required to be provided with ground-fault protection if the service device provides the required protection. Installations performed prior to the 2008 edition of the *NEC*® permitted “re-grounding” of the grounded conductor at the separate building if an equipment grounding conductor was not included with the supply circuit. Where re-grounding of the neutral occurs downstream from the service, the re-grounding may nullify the ground-fault protection (or result in unwanted operation of the protection), because the neutral current has parallel paths on which to return to the source. Feeders or branch circuits supplying other buildings or structures may have to be isolated to allow for proper operation of the service ground-fault protection, and separate ground-fault protection installed at the building disconnecting means is then necessary to meet the requirements of 240.13.

210.13, 215.10, and Article 225, Part II, for the requirements for building disconnects not on the utility service

240.15 Ungrounded Conductors.

(A) Overcurrent Device Required. A fuse or an overcurrent trip unit of a circuit breaker shall be connected in series with each ungrounded conductor. A combination of a current transformer and overcurrent relay shall be considered equivalent to an overcurrent trip unit.

Informational Note: For motor circuits, see Parts III, IV, V, and XI of Article 430.

(B) Circuit Breaker as Overcurrent Device. Circuit breakers shall open all ungrounded conductors of the circuit both manually and automatically unless otherwise permitted in 240.15(B)(1), (B)(2), (B)(3), and (B)(4).

(1) Multiwire Branch Circuits. Individual single-pole circuit breakers, with identified handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.

(2) Grounded Single-Phase Alternating-Current Circuits. In grounded systems, individual single-pole circuit breakers rated 120/240 volts ac, with identified handle ties, shall be permitted as the protection for each ungrounded conductor for line-to-line connected loads for single-phase circuits.

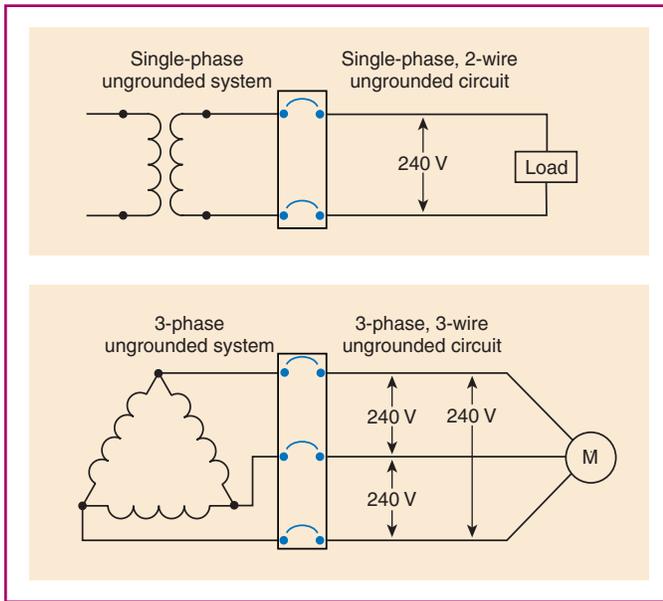

EXHIBIT 240.5 Examples of circuits that require multipole common trip circuit breakers.

(3) 3-Phase and 2-Phase Systems. For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems, individual single-pole circuit breakers rated 120/240 volts ac with identified handle ties shall be permitted as the protection for each ungrounded conductor, if the systems have a grounded neutral point and the voltage to ground does not exceed 120 volts.

(4) 3-Wire Direct-Current Circuits Individual single pole circuit breakers rated 125/250 volts dc with identified handle ties shall be permitted as the protection for each ungrounded conductor for line-to-line connected loads for 3-wire, direct-current circuits supplied from a system with a grounded neutral where the voltage to ground does not exceed 125 volts.

The basic rule in 240.15 requires circuit breakers to open all ungrounded conductors of the circuit when they trip (automatic operation in response to overcurrent) or are manually operated as a disconnecting means. For 2-wire circuits with one conductor grounded, this rule is simple and needs no further explanation. For branch circuits that are comprised of multipole ungrounded conductors that do not meet the conditions of B(1) through B(4), multipole common trip circuit breakers are required. Exhibit 240.5 shows where multiple common trip circuit breakers are required. Handle ties are not permitted because the circuits are supplied from ungrounded systems.

Multipole branch circuits are permitted to supply line-to-line connected loads where the loads are associated with a single piece of utilization equipment or where all of the ungrounded conductors are opened simultaneously by the branch-circuit overcurrent device (automatic opening in response to overcurrent).

See also

210.4(C) and its commentary for more on multiwire branch circuits for these loads

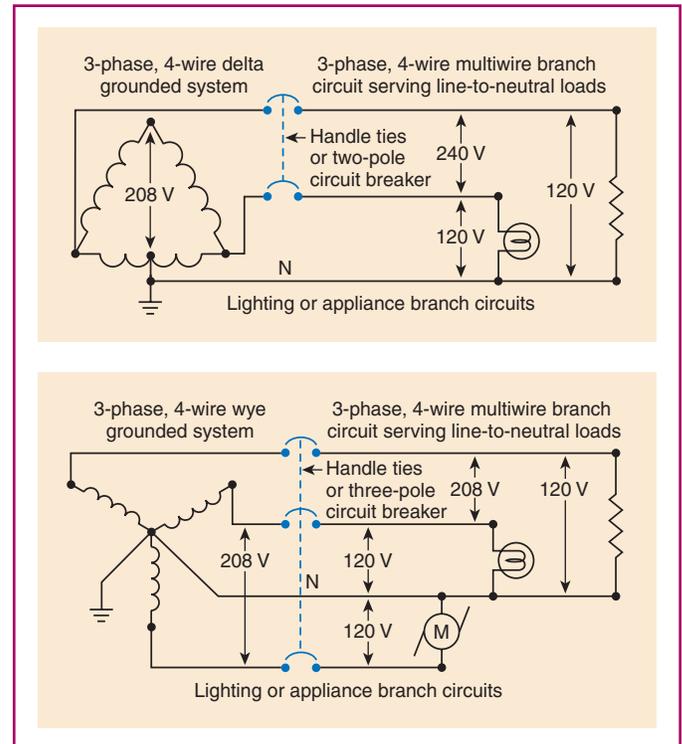

EXHIBIT 240.6 Examples of circuits in which single-pole circuit breakers are permitted, because they open the ungrounded conductor of the circuit.

The most widely used method is to install a multipole circuit breaker with an internal common trip mechanism. The use of such multipole devices provides overcurrent protection and the required disconnecting means. This breaker is operated by an external single lever internally attached to the two or three poles of the circuit breaker, or the external lever may be attached to multiple handles operated as one.

The second method permitted for multiwire branch circuits is to use two or three single-pole circuit breakers and add an identified handle tie to function as a common operating handle. This multipole circuit breaker is field assembled by externally attaching an identified common lever (handle tie) onto the two or three individual circuit breakers. These circuit breakers can be used as the protection of line-to-line connected loads in grounded single-phase and grounded 3-phase alternating current systems, but this requirement is limited to circuit breakers rated 120/240 volts. Handle ties do not cause the circuit breaker to function as a common trip device; rather, they only allow common operation as a disconnecting means. The term *identified* requires the use of hardware designed specifically to perform this common disconnecting means function. The use of homemade hardware such as nails or pieces of wire to perform this function is not an *identified* means.

Exhibit 240.6 shows where handle ties are required for single-pole circuit breakers on multiwire branch circuits serving line-to-neutral loads. Exhibit 240.7 shows where handle ties are required for single-pole circuit breakers on multiwire branch circuits serving line-to-line loads. The multiwire branch circuit shown in the top and middle diagrams supplies a single piece of utilization equipment in accordance with 210.4(C), Exception No. 1. For these branch circuits, common trip operation is permitted but is not required.

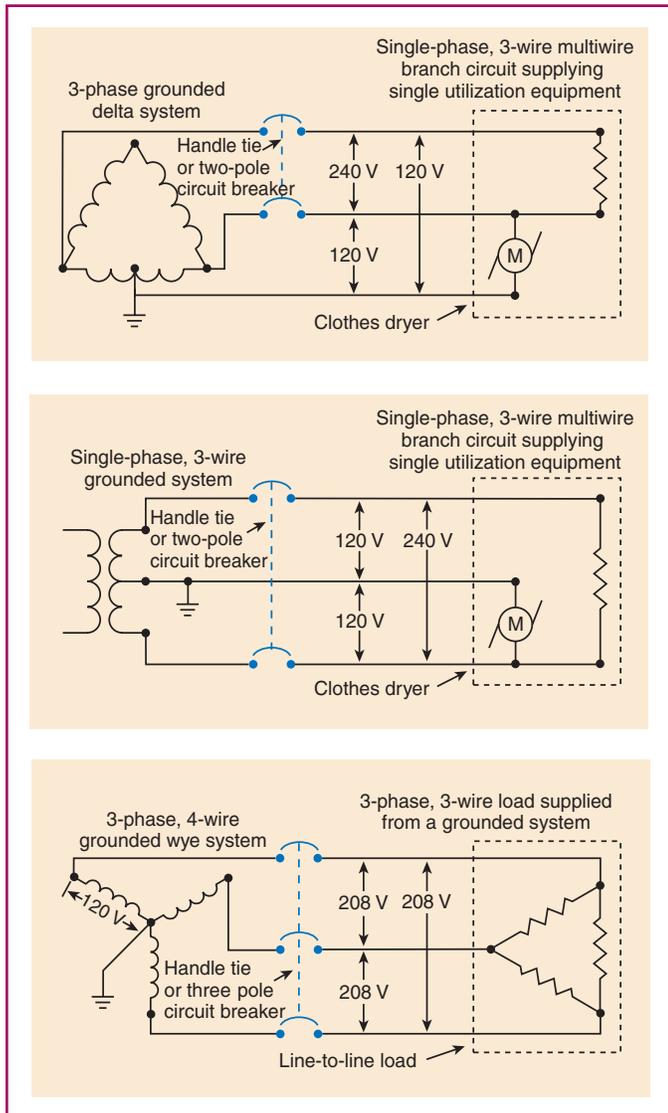

EXHIBIT 240.7 Examples of circuits in which identified handle ties are permitted to provide the simultaneous disconnecting function.

Section 240.15(B)(4) covers protection of direct current circuits and permits the use of two single-pole circuit breakers (rated for dc application) with identified handle ties to be used for the overcurrent protection of line-to-line connected loads. The 3-wire circuits covered by this requirement are *multiwire branch circuits* per the definition in Article 100 and as such are subject to all of the requirements specified in 210.4.

Part II. Location

240.21 Location in Circuit. Overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply except as specified in 240.21(A) through (H). Conductors supplied under the provisions of 240.21(A) through (H) shall not supply another conductor except through an overcurrent protective device meeting the requirements of 240.4.

(A) Branch-Circuit Conductors. Branch-circuit tap conductors meeting the requirements specified in 210.19 shall be permitted to have overcurrent protection as specified in 210.20.

(B) Feeder Taps. Conductors shall be permitted to be tapped, without overcurrent protection at the tap, to a feeder as specified in 240.21(B)(1) through (B)(5). The provisions of 240.4(B) shall not be permitted for tap conductors.

An OCPD is not permitted to be supplied by a tap conductor having an ampacity less than its rating. For example, the use of a 500-kcmil THWN copper conductor [380 amperes, per Table 310.15(B)(16)] as a tap conductor to supply a 400-ampere rated device is not permitted.

See also

240.2 for the definition and the associated commentary of *tap conductor*

(1) Taps Not over 3 m (10 ft) Long. If the length of the tap conductors does not exceed 3 m (10 ft) and the tap conductors comply with all of the following:

- (1) The ampacity of the tap conductors is
 - a. Not less than the combined calculated loads on the circuits supplied by the tap conductors, and
 - b. Not less than the rating of the equipment containing an overcurrent device(s) supplied by the tap conductors or not less than the rating of the overcurrent protective device at the termination of the tap conductors.

Exception to b: Where listed equipment, such as a surge protective device(s) [SPD(s)], is provided with specific instructions on minimum conductor sizing, the ampacity of the tap conductors supplying that equipment shall be permitted to be determined based on the manufacturer's instructions.

- (2) The tap conductors do not extend beyond the switchboard, switchgear, panelboard, disconnecting means, or control devices they supply.
- (3) Except at the point of connection to the feeder, the tap conductors are enclosed in a raceway, which extends from the tap to the enclosure of an enclosed switchboard, switchgear, a panelboard, or control devices, or to the back of an open switchboard.
- (4) For field installations, if the tap conductors leave the enclosure or vault in which the tap is made, the ampacity of the tap conductors is not less than one-tenth of the rating of the overcurrent device protecting the feeder conductors.

Informational Note: For overcurrent protection requirements for panelboards, see 408.36.

(2) Taps Not over 7.5 m (25 ft) Long. Where the length of the tap conductors does not exceed 7.5 m (25 ft) and the tap conductors comply with all the following:

- (1) The ampacity of the tap conductors is not less than one-third of the rating of the overcurrent device protecting the feeder conductors.

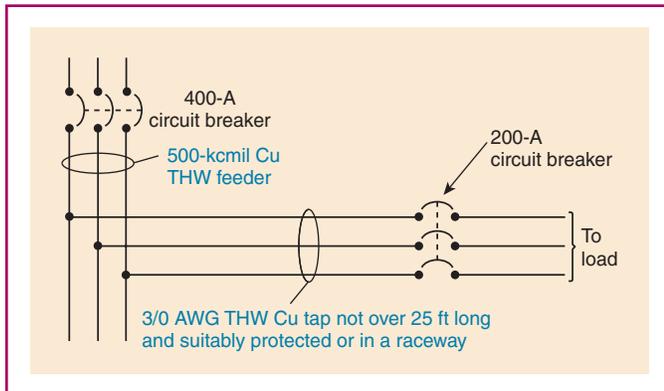

EXHIBIT 240.8 An example in which the feeder taps terminate in a single circuit breaker.

- (2) The tap conductors terminate in a single circuit breaker or a single set of fuses that limit the load to the ampacity of the tap conductors. This device shall be permitted to supply any number of additional overcurrent devices on its load side.
- (3) The tap conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

Exhibit 240.8 illustrates an installation that meets the feeder tap requirements of 240.21(B)(2). The ampacity of the 3/0 AWG, Type THW copper conductor (200 amperes) is more than one-third the rating of the overcurrent device (400 amperes) protecting the feeder circuit. Note that the lengths specified in 240.21(B) and (C) apply to the conductors, not to a raceway enclosing the conductors or to the distance between the enclosures in which the tap conductors originate and terminate

See also

Table 310.15(B)(16) for the ampacity of copper conductors in conduit

(3) Taps Supplying a Transformer [Primary Plus Secondary Not over 7.5 m (25 ft) Long]. Where the tap conductors supply a transformer and comply with all the following conditions:

- (1) The conductors supplying the primary of a transformer have an ampacity at least one-third the rating of the overcurrent device protecting the feeder conductors.
- (2) The conductors supplied by the secondary of the transformer shall have an ampacity that is not less than the value of the primary-to-secondary voltage ratio multiplied by one-third of the rating of the overcurrent device protecting the feeder conductors.
- (3) The total length of one primary plus one secondary conductor, excluding any portion of the primary conductor that is protected at its ampacity, is not over 7.5 m (25 ft).
- (4) The primary and secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.
- (5) The secondary conductors terminate in a single circuit breaker or set of fuses that limit the load current to not more than the conductor ampacity that is permitted by 310.15.

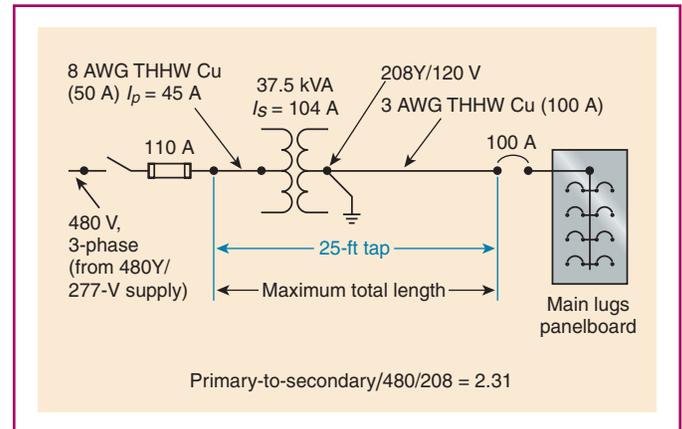

EXHIBIT 240.9 An example in which the transformer feeder taps (primary plus secondary) are not over 25 feet long.

This section covers applications where the conductor length of 25 feet is applied to the primary and secondary conductors (using the length of one primary conductor plus the length of one secondary conductor for the measurement). The transformer primary conductors are tapped from a feeder, and the secondary conductors are required to terminate in a single OCPD. If the primary conductors are protected in accordance with their ampacity, 240.21(C)(6) permits the entire 25-foot measurement to be applied to the transformer secondary conductors. **Exhibit 240.9** illustrates the conditions of 240.21(B)(3)(1) through (5). The overcurrent protection requirements of 408.36 for panelboards and 450.3(B) for transformers also apply.

(4) Taps over 7.5 m (25 ft) Long. Where the feeder is in a high bay manufacturing building over 11 m (35 ft) high at walls and the installation complies with all the following conditions:

- (1) Conditions of maintenance and supervision ensure that only qualified persons service the systems.
- (2) The tap conductors are not over 7.5 m (25 ft) long horizontally and not over 30 m (100 ft) total length.
- (3) The ampacity of the tap conductors is not less than one-third the rating of the overcurrent device protecting the feeder conductors.
- (4) The tap conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the tap conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.
- (5) The tap conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.
- (6) The tap conductors are continuous from end-to-end and contain no splices.
- (7) The tap conductors are sized 6 AWG copper or 4 AWG aluminum or larger.
- (8) The tap conductors do not penetrate walls, floors, or ceilings.
- (9) The tap is made no less than 9 m (30 ft) from the floor.

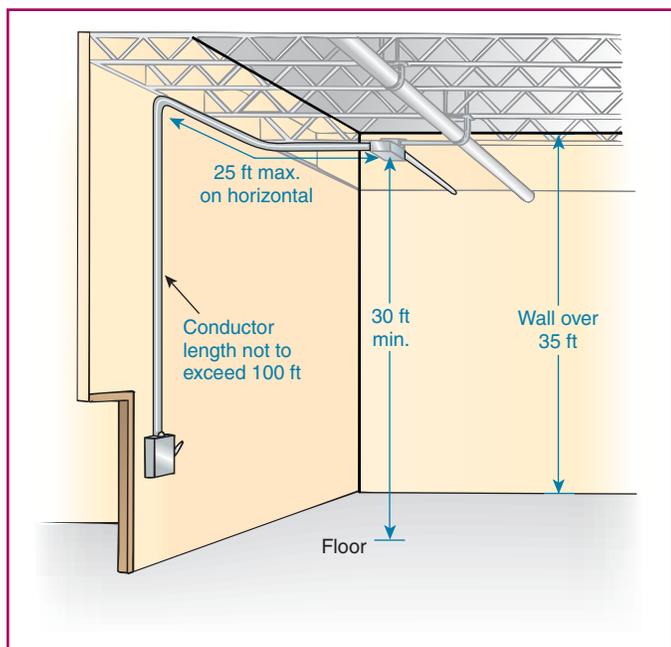

EXHIBIT 240.10 An illustration of a feeder tap in a high bay building.

Exhibit 240.10 illustrates an installation complying with 240.21(B)(4).

(5) Outside Taps of Unlimited Length. Where the conductors are located outside of a building or structure, except at the point of load termination, and comply with all of the following conditions:

- (1) The tap conductors are protected from physical damage in an approved manner.
- (2) The tap conductors terminate at a single circuit breaker or a single set of fuses that limits the load to the ampacity of the tap conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.
- (3) The overcurrent device for the tap conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.
- (4) The disconnecting means for the tap conductors is installed at a readily accessible location complying with one of the following:
 - a. Outside of a building or structure
 - b. Inside, nearest the point of entrance of the tap conductors
 - c. Where installed in accordance with 230.6, nearest the point of entrance of the tap conductors

Section 240.21(B)(5) is a tap conductor requirement that is similar in some respects to an installation of service conductors. The conductors are supplied from a feeder at an outdoor location and run to a building or structure without limitations on the tap conductor length. The OCPD provides overload protection for the tap conductors. The fused switch or circuit breaker is installed at a readily accessible location either inside or outside a building or structure at a point nearest to where the tap conductors enter the building or structure. This disconnect is subject to the

applicable requirements covering feeder disconnecting means in Part II of Article 225.

(C) Transformer Secondary Conductors. A set of conductors feeding a single load, or each set of conductors feeding separate loads, shall be permitted to be connected to a transformer secondary, without overcurrent protection at the secondary, as specified in 240.21(C)(1) through (C)(6). The provisions of 240.4(B) shall not be permitted for transformer secondary conductors.

Informational Note: For overcurrent protection requirements for transformers, see 450.3.

Section 240.21(C) prohibits using the next higher standard size OCPD to protect transformer secondary conductors. See the commentary for 240.21(B).

The secondary terminals of a transformer are permitted to supply one or more than one set of secondary conductors. For example, the secondary terminals could supply two separate sets of secondary conductors that feed two panelboards. One set of conductors could be installed using the 25-foot secondary conductor rule of 240.21(C)(6), while the other set of conductors could be installed using the 10-foot secondary conductor rule of 240.21(C)(2). Each set is treated individually in applying the applicable secondary conductor requirement.

The NEC requires both the protection of conductors and the protection of transformers. This article contains requirements for protection of conductors. Article 450 contains requirements for the protection of transformers. It is possible to protect both with the same device. However, the device must meet the requirements of both articles.

(1) Protection by Primary Overcurrent Device. Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, or a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 450.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.

Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors are not considered to be protected by the primary overcurrent protective device.

(2) Transformer Secondary Conductors Not over 3 m (10 ft) Long. If the length of secondary conductor does not exceed 3 m (10 ft) and complies with all of the following:

- (1) The ampacity of the secondary conductors is
 - a. Not less than the combined calculated loads on the circuits supplied by the secondary conductors, and
 - b. Not less than the rating of the equipment containing an overcurrent device(s) supplied by the secondary conductors or not less than the rating of the overcurrent protective device at the termination of the secondary conductors.

Exception: Where listed equipment, such as a surge protective device(s) [SPD(s)], is provided with specific instructions on

minimum conductor sizing, the ampacity of the tap conductors supplying that equipment shall be permitted to be determined based on the manufacturer's instructions.

- (2) The secondary conductors do not extend beyond the switchboard, switchgear, panelboard, disconnecting means, or control devices they supply.
- (3) The secondary conductors are enclosed in a raceway, which shall extend from the transformer to the enclosure of an enclosed switchboard, switchgear, a panelboard, or control devices or to the back of an open switchboard.
- (4) For field installations where the secondary conductors leave the enclosure or vault in which the supply connection is made, the rating of the overcurrent device protecting the primary of the transformer, multiplied by the primary to secondary transformer voltage ratio, shall not exceed 10 times the ampacity of the secondary conductor.

Informational Note: For overcurrent protection requirements for panelboards, see 408.36.

The size–rating relationship between the primary OCPD and the secondary conductors is necessary because the transformer primary device provides short-circuit ground-fault protection for the transformer secondary conductors. The ampacity of the conductors must be adequate for the calculated load and not less than the rating of the device or OCPD in which the conductors terminate. The following example illustrates the application of this requirement.

Calculation Example

Apply the 10-ft secondary conductor protection criteria of 240.21(C)(2) to a transformer rated 75 kVA, 3-phase, 480 V primary to 208Y/120 V secondary. The transformer primary OCPD is rated 125 A. Determine the minimum secondary conductor size for the installation of one of the sets of secondary conductors.

Solution

Step 1. Determine 1/10 of the primary OCPD rating using the following calculation:

$$125 \text{ A} \div 10 = 12.5 \text{ A}$$

Step 2. Determine the line-to-line primary-to-secondary voltage ratio:

$$\left(\frac{480}{208}\right) = 2.31$$

Step 3. Determine the minimum ampacity for ungrounded transformer secondary conductor:

$$12.5 \text{ A} \times 2.31 = 29 \text{ A} \rightarrow 10 \text{ AWG copper THWN} \\ \text{[Table 310.15(B)(16)]}; 30 \text{ A from } 60^\circ\text{C column}$$

A 10 AWG copper conductor is permitted to be supplied from the secondary of this transformer with primary overcurrent protection rated 125 A. The load supplied by this secondary conductor cannot exceed the conductor's allowable ampacity from Table 310.15(B)(16) coordinated with the temperature rating of the conductor terminations in accordance with 110.14(C)(1)(a).

(3) Industrial Installation Secondary Conductors Not over 7.5 m (25 ft) Long. For the supply of switchgear or switchboards in industrial installations only, where the length of the secondary conductors does not exceed 7.5 m (25 ft) and complies with all of the following:

- (1) Conditions of maintenance and supervision ensure that only qualified persons service the systems.
- (2) The ampacity of the secondary conductors is not less than the secondary current rating of the transformer, and the sum of the ratings of the overcurrent devices does not exceed the ampacity of the secondary conductors.
- (3) All overcurrent devices are grouped.
- (4) The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(4) Outside Secondary Conductors. Where the conductors are located outside of a building or structure, except at the point of load termination, and comply with all of the following conditions:

- (1) The conductors are protected from physical damage in an approved manner.
- (2) The conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.
- (3) The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.
- (4) The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:
 - a. Outside of a building or structure
 - b. Inside, nearest the point of entrance of the conductors
 - c. Where installed in accordance with 230.6, nearest the point of entrance of the conductors

(5) Secondary Conductors from a Feeder Tapped Transformer. Transformer secondary conductors installed in accordance with 240.21(B)(3) shall be permitted to have overcurrent protection as specified in that section.

(6) Secondary Conductors Not over 7.5 m (25 ft) Long. Where the length of secondary conductor does not exceed 7.5 m (25 ft) and complies with all of the following:

- (1) The secondary conductors shall have an ampacity that is not less than the value of the primary-to-secondary voltage ratio multiplied by one-third of the rating of the overcurrent device protecting the primary of the transformer.
- (2) The secondary conductors terminate in a single circuit breaker or set of fuses that limit the load current to not more than the conductor ampacity that is permitted by 310.15.
- (3) The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(D) Service Conductors. Service conductors shall be permitted to be protected by overcurrent devices in accordance with 230.91.

(E) Busway Taps. Busways and busway taps shall be permitted to be protected against overcurrent in accordance with 368.17.

(F) Motor Circuit Taps. Motor-feeder and branch-circuit conductors shall be permitted to be protected against overcurrent in accordance with 430.28 and 430.53, respectively.

(G) Conductors from Generator Terminals. Conductors from generator terminals that meet the size requirement in 445.13 shall be permitted to be protected against overload by the generator overload protective device(s) required by 445.12.

(H) Battery Conductors. Overcurrent protection shall be permitted to be installed as close as practicable to the storage battery terminals in an unclassified location. Installation of the overcurrent protection within a hazardous (classified) location shall also be permitted.

240.22 Grounded Conductor. No overcurrent device shall be connected in series with any conductor that is intentionally grounded, unless one of the following two conditions is met:

- (1) The overcurrent device opens all conductors of the circuit, including the grounded conductor, and is designed so that no pole can operate independently.
- (2) Where required by 430.36 or 430.37 for motor overload protection.

240.23 Change in Size of Grounded Conductor. Where a change occurs in the size of the ungrounded conductor, a similar change shall be permitted to be made in the size of the grounded conductor.

240.24 Location in or on Premises.

(A) Accessibility. Switches containing fuses and circuit breakers shall be readily accessible and installed so that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the floor or working platform, unless one of the following applies:

- (1) For busways, as provided in 368.17(C).
- (2) For supplementary overcurrent protection, as described in 240.10.
- (3) For overcurrent devices, as described in 225.40 and 230.92.
- (4) For overcurrent devices adjacent to utilization equipment that they supply, access shall be permitted to be by portable means.

This section recognizes the need for overcurrent protection in locations that are not readily accessible, such as above suspended ceilings. Overcurrent devices are permitted to be located so that they are not readily accessible, as long as they are located next to the appliance, motor, or other equipment they supply and can be reached by using a ladder. For the purposes of this requirement, ready access to the operating handle

of a fusible switch or circuit breaker is considered to be not more than 6 feet 7 inches above the finished floor or working platform.

The measurement is made from the center of the device operating handle where the handle is at its highest position. This text parallels the requirement of 404.8(A), which applies to all switches and circuit breakers used as switches.

See also

240.10 for information regarding the accessibility of supplementary overcurrent devices

Exception: The use of a tool shall be permitted to access overcurrent devices located within listed industrial control panels or similar enclosures.

(B) Occupancy. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy, unless otherwise permitted in 240.24(B)(1) and (B)(2).

(1) Service and Feeder Overcurrent Devices. Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service overcurrent devices and feeder overcurrent devices supplying more than one occupancy shall be permitted to be accessible only to authorized management personnel in the following:

- (1) Multiple-occupancy buildings
- (2) Guest rooms or guest suites

(2) Branch-Circuit Overcurrent Devices. Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the branch-circuit overcurrent devices supplying any guest rooms or guest suites without permanent provisions for cooking shall be permitted to be accessible only to authorized management personnel.

(C) Not Exposed to Physical Damage. Overcurrent devices shall be located where they will not be exposed to physical damage.

Informational Note: See 110.11, Deteriorating Agents.

(D) Not in Vicinity of Easily Ignitable Material. Overcurrent devices shall not be located in the vicinity of easily ignitable material, such as in clothes closets.

(E) Not Located in Bathrooms. In dwelling units, dormitories, and guest rooms or guest suites, overcurrent devices, other than supplementary overcurrent protection, shall not be located in bathrooms.

(F) Not Located over Steps. Overcurrent devices shall not be located over steps of a stairway.

Part III. Enclosures

240.30 General.

(A) Protection from Physical Damage. Overcurrent devices shall be protected from physical damage by one of the following:

- (1) Installation in enclosures, cabinets, cutout boxes, or equipment assemblies
- (2) Mounting on open-type switchboards, panelboards, or control boards that are in rooms or enclosures free from dampness and easily ignitable material and are accessible only to qualified personnel

Physical damage includes exposure to deteriorating agents that adversely affect the operation of the OCPD. Enclosures for OCPDs protect the devices against physical damage. Guarding through controlled access is another means of affording protection against physical damage.

(B) Operating Handle. The operating handle of a circuit breaker shall be permitted to be accessible without opening a door or cover.

240.32 Damp or Wet Locations. Enclosures for overcurrent devices in damp or wet locations shall comply with 312.2.

240.33 Vertical Position. Enclosures for overcurrent devices shall be mounted in a vertical position unless that is shown to be impracticable. Circuit breaker enclosures shall be permitted to be installed horizontally where the circuit breaker is installed in accordance with 240.81. Listed busway plug-in units shall be permitted to be mounted in orientations corresponding to the busway mounting position.

A wall-mounted vertical position for enclosures for overcurrent devices affords easier access, natural hand operation, normal swinging or closing of doors or covers, and legibility of the manufacturer's markings. Compliance with the requirement that the up position of the handle is on or closed, and the down position of the handle is off or open, in accordance with 240.81, limits the number of pole spaces available in a panelboard where its cabinet is mounted in a horizontal position. Because of the orientation of the buses in the panelboard, many of the circuit breakers would have their "on" and "off" operation upside down, which would not comply with 240.81.

Part IV. Disconnecting and Guarding

240.40 Disconnecting Means for Fuses. Cartridge fuses in circuits of any voltage where accessible to other than qualified persons, and all fuses in circuits over 150 volts to ground, shall be provided with a disconnecting means on their supply side so that each circuit containing fuses can be independently disconnected from the source of power. A current-limiting device without a disconnecting means shall be permitted on the supply side of the service disconnecting means as permitted by 230.82. A single disconnecting means shall be permitted on the supply side of more than one set of fuses as permitted by 430.112, Exception, for group operation of motors and 424.22(C) for fixed electric space-heating equipment.

240.41 Arcing or Suddenly Moving Parts. Arcing or suddenly moving parts shall comply with 240.41(A) and (B).

(A) Location. Fuses and circuit breakers shall be located or shielded so that persons will not be burned or otherwise injured by their operation.

(B) Suddenly Moving Parts. Handles or levers of circuit breakers, and similar parts that may move suddenly in such a way that persons in the vicinity are likely to be injured by being struck by them, shall be guarded or isolated.

Guardrails can be provided in the vicinity of disconnecting means as a means of protecting persons against injury caused by suddenly moving handles of OCPDs. Switchboards equipped with removable handles help mitigate this personal injury hazard. See the definition of *guarded* in Article 100.

110.27 for the guarding of live parts (1000 volts, nominal, or less)

Part V. Plug Fuses, Fuseholders, and Adapters

240.50 General.

(A) Maximum Voltage. Plug fuses shall be permitted to be used in the following circuits:

- (1) Circuits not exceeding 125 volts between conductors
- (2) Circuits supplied by a system having a grounded neutral point where the line-to-neutral voltage does not exceed 150 volts

(B) Marking. Each fuse, fuseholder, and adapter shall be marked with its ampere rating.

(C) Hexagonal Configuration. Plug fuses of 15 ampere and lower rating shall be identified by a hexagonal configuration of the window, cap, or other prominent part to distinguish them from fuses of higher ampere ratings.

The 10- and 15-ampere plug fuses shown in Exhibit 240.11 are equipped with the hexagonal window required by 240.50(C). The 10-ampere fuse is

EXHIBIT 240.11 Two plug fuses and a Type S fuse. (Courtesy of Eaton, Bussmann Division)

EXHIBIT 240.12 Type S nonrenewable plug fuse and fuse adapter.
(Courtesy of Eaton, Bussmann Division)

a Type S plug fuse, which cannot be interchanged with a higher rated fuse where used with its corresponding adapter.

(D) No Energized Parts Plug fuses, fuseholders, and adapters shall have no exposed energized parts after fuses or fuses and adapters have been installed.

(E) Screw Shell. The screw shell of a plug-type fuseholder shall be connected to the load side of the circuit.

Exhibit 240.12 shows a Type S nonrenewable plug fuse adapter designed to meet the requirements of 240.53 and 240.54. To prevent installation of a fuse exceeding the ampacity of the conductor being protected, the adapter will not accept Type S plug fuses having an ampere rating other than that for which it is specifically designed. Type S fuses have various size screw-in and thread dimensions for various ampere ratings.

240.51 Edison-Base Fuses.

(A) Classification. Plug fuses of the Edison-base type shall be classified at not over 125 volts and 30 amperes and below.

(B) Replacement Only. Plug fuses of the Edison-base type shall be used only for replacements in existing installations where there is no evidence of overfusing or tampering.

240.52 Edison-Base Fuseholders. Fuseholders of the Edison-base type shall be installed only where they are made to accept Type S fuses by the use of adapters.

240.53 Type S Fuses. Type S fuses shall be of the plug type and shall comply with 240.53(A) and (B).

(A) Classification. Type S fuses shall be classified at not over 125 volts and 0 to 15 amperes, 16 to 20 amperes, and 21 to 30 amperes.

(B) Noninterchangeable. Type S fuses of an ampere classification as specified in 240.53(A) shall not be interchangeable with a lower ampere classification. They shall be designed so that they cannot be used in any fuseholder other than a Type S fuseholder or a fuseholder with a Type S adapter inserted.

240.54 Type S Fuses, Adapters, and Fuseholders.

(A) To Fit Edison-Base Fuseholders. Type S adapters shall fit Edison-base fuseholders.

(B) To Fit Type S Fuses Only. Type S fuseholders and adapters shall be designed so that either the fuseholder itself or the fuseholder with a Type S adapter inserted cannot be used for any fuse other than a Type S fuse.

(C) Nonremovable. Type S adapters shall be designed so that once inserted in a fuseholder, they cannot be removed.

(D) Nontamperable. Type S fuses, fuseholders, and adapters shall be designed so that tampering or shunting (bridging) would be difficult.

(E) Interchangeability. Dimensions of Type S fuses, fuseholders, and adapters shall be standardized to permit interchangeability regardless of the manufacturer.

Part VI. Cartridge Fuses and Fuseholders

240.60 General.

(A) Maximum Voltage — 300-Volt Type. Cartridge fuses and fuseholders of the 300-volt type shall be permitted to be used in the following circuits:

- (1) Circuits not exceeding 300 volts between conductors
- (2) Single-phase line-to-neutral circuits supplied from a 3-phase, 4-wire, solidly grounded neutral source where the line-to-neutral voltage does not exceed 300 volts

(B) Noninterchangeable — 0–6000-Ampere Cartridge Fuseholders. Fuseholders shall be designed so that it will be difficult to put a fuse of any given class into a fuseholder that is designed for a current lower, or voltage higher, than that of the class to which the fuse belongs. Fuseholders for current-limiting fuses shall not permit insertion of fuses that are not current-limiting.

See Exhibit 240.13 for an example of a current-limiting fuse and fuseholder with rejection features.

(C) Marking. Fuses shall be plainly marked, either by printing on the fuse barrel or by a label attached to the barrel showing the following:

- (1) Ampere rating
- (2) Voltage rating

EXHIBIT 240.13 A fuse block rejection pin and notch in the fuse blade (red arrows) ensure that circuit protection is provided by fuses with a specific level of overcurrent protection. (Courtesy of Eaton, Bussmann Division)

- (3) Interrupting rating where other than 10,000 amperes
- (4) Current limiting where applicable
- (5) The name or trademark of the manufacturer

The interrupting rating shall not be required to be marked on fuses used for supplementary protection.

Exhibit 240.14 shows two examples of Class G fuses rated 300 volts that bear the markings required by 240.60(C). Class H-type cartridge fuses have an interrupting capacity (IC) rating of 10,000 amperes, which does not need to be marked on the fuse. However, Class CC, G, J, K, L, R, and

EXHIBIT 240.14 Two fuses rated 300 volts with marking to indicate they are Class G. (Courtesy of Eaton, Bussmann Division)

T cartridge fuses exceed the 10,000-ampere IC rating and must be marked with the IC rating. See the definition of *supplementary overcurrent protective device* in Article 100.

(D) Renewable Fuses. Class H cartridge fuses of the renewable type shall be permitted to be used only for replacement in existing installations where there is no evidence of overfusing or tampering.

Where overfusing and/or tampering are detected with an existing installation, the use of nonrenewable fuses as a replacement is mandatory. An important consideration in the use of the traditional Class H renewable fuse is its 10,000-ampere interrupting rating. Caution must be exercised where the use of renewable fuses is contemplated, because the manufacturer's directions provided in some modern fusible switches do not permit the use of renewable fuses or recommend against their use.

240.61 Classification. Cartridge fuses and fuseholders shall be classified according to voltage and amperage ranges. Fuses rated 1000 volts, nominal, or less shall be permitted to be used for voltages at or below their ratings.

See also

Part II of Article 100 for definitions covering fuses rated over 1000 volts

490.21(B) for applications of high-voltage fuses and fuseholders

240.67 Arc Energy Reduction. Where fuses rated 1200 A or higher are installed, 240.67(A) and (B) shall apply. This requirement shall become effective January 1, 2020.

This requirement for arc energy reduction for fuses is similar to the requirement for circuit breakers in 240.87. Circuit breakers utilizing zone selective interlocking to meet the requirements of 240.87 can take up to 0.07 seconds to open the circuit. Therefore, a maximum fuse opening time of 0.07 seconds was also chosen to provide equivalent protection to that provided by circuit breakers.

See also

240.87 and its commentary for more information

(A) Documentation. Documentation shall be available to those authorized to design, install, operate, or inspect the installation as to the location of the fuses.

(B) Method to Reduce Clearing Time. A fuse shall have a clearing time of 0.07 seconds or less at the available arcing current, or one of the following shall be provided:

- (1) Differential relaying
- (2) Energy-reducing maintenance switching with local status indicator
- (3) Energy-reducing active arc flash mitigation system
- (4) An approved equivalent means

Informational Note No. 1: An energy-reducing maintenance switch allows a worker to set a disconnect switch to reduce the clearing time while the worker is working within an arc-flash boundary as defined in *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*, and then to set the disconnect switch

back to a normal setting after the potentially hazardous work is complete.

Informational Note No. 2: An energy-reducing active arc flash mitigation system helps in reducing arcing duration in the electrical distribution system. No change in the disconnect switch or the settings of other devices is required during maintenance when a worker is working within an arc flash boundary as defined in *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*.

Informational Note No. 3: IEEE 1584, *IEEE Guide for Performing Arc Flash Hazard Calculations*, is one of the available methods that provides guidance in determining arcing current.

Part VII. Circuit Breakers

240.80 Method of Operation. Circuit breakers shall be trip free and capable of being closed and opened by manual operation. Their normal method of operation by other than manual means, such as electrical or pneumatic, shall be permitted if means for manual operation are also provided.

240.81 Indicating. Circuit breakers shall clearly indicate whether they are in the open “off” or closed “on” position.

Where circuit breaker handles are operated vertically rather than rotationally or horizontally, the “up” position of the handle shall be the “on” position.

If the panelboard enclosure is mounted in a horizontal position, compliance with this requirement that the up position of the handle is on or closed, and the down position of the handle is off or open, limits the number of pole spaces available in a panelboard. This results in some of the circuit breakers having their “on” and “off” operation upside down.

Opening or turning off a circuit breaker or switch is one of the operations in achieving an electrically safe work condition for servicing or maintenance. *NFPA 70E*, *Standard for Electrical Safety in the Workplace*, contains additional steps that must be followed to verify that electrical conductors or circuit parts are de-energized.

240.82 Nontamperable. A circuit breaker shall be of such design that any alteration of its trip point (calibration) or the time required for its operation requires dismantling of the device or breaking of a seal for other than intended adjustments.

240.83 Marking.

(A) Durable and Visible. Circuit breakers shall be marked with their ampere rating in a manner that will be durable and visible after installation. Such marking shall be permitted to be made visible by removal of a trim or cover.

(B) Location. Circuit breakers rated at 100 amperes or less and 1000 volts or less shall have the ampere rating molded, stamped, etched, or similarly marked into their handles or escutcheon areas.

(C) Interrupting Rating. Every circuit breaker having an interrupting rating other than 5000 amperes shall have its interrupting rating shown on the circuit breaker. The interrupting rating shall not be required to be marked on circuit breakers used for supplementary protection.

(D) Used as Switches. Circuit breakers used as switches in 120-volt and 277-volt fluorescent lighting circuits shall be listed and shall be marked SWD or HID. Circuit breakers used as switches in high-intensity discharge lighting circuits shall be listed and shall be marked as HID.

Circuit breakers marked SWD have been subjected to additional endurance and temperature testing to assess their ability for use as the regular control device for fluorescent lighting circuits. Circuit breakers marked HID are also acceptable for use as the regular switching device to control high-intensity discharge (HID) lighting such as mercury vapor, high-pressure or low-pressure sodium, or metal halide lighting. Circuit breakers marked HID can be used for switching both HID and fluorescent lighting loads; however, a circuit breaker marked SWD can be used only as a switching device for fluorescent lighting loads.

(E) Voltage Marking. Circuit breakers shall be marked with a voltage rating not less than the nominal system voltage that is indicative of their capability to interrupt fault currents between phases or phase to ground.

240.85 Applications. A circuit breaker with a straight voltage rating, such as 240V or 480V, shall be permitted to be applied in a circuit in which the nominal voltage between any two conductors does not exceed the circuit breaker’s voltage rating. A two-pole circuit breaker shall not be used for protecting a 3-phase, corner-grounded delta circuit unless the circuit breaker is marked 1 ϕ -3 ϕ to indicate such suitability.

A circuit breaker with a slash rating, such as 120/240V or 480Y/277V, shall be permitted to be applied in a solidly grounded circuit where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the circuit breaker’s voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker’s voltage rating.

Informational Note: Proper application of molded case circuit breakers on 3-phase systems, other than solidly grounded wye, particularly on corner grounded delta systems, considers the circuit breakers’ individual pole-interrupting capability.

A circuit breaker marked 480Y/277 volts is not intended for use on a 480-volt system with up to 480 volts to ground, such as a 480-volt circuit derived from a corner-grounded, delta-connected system. A circuit breaker marked either 480 volts or 600 volts should be used on such a system. Similarly, a circuit breaker marked 120/240 volts is not intended for use on a delta-connected 240-volt circuit. A 240-volt, 480-volt, or 600-volt circuit breaker should be used on such a circuit. The slash (/) between the lower and higher voltage ratings in the marking indicates that the circuit breaker has been tested for use on a circuit with the higher voltage between phases and with the lower voltage to ground.

240.86 Series Ratings. Where a circuit breaker is used on a circuit having an available fault current higher than the marked interrupting rating by being connected on the load side of an acceptable overcurrent protective device having a higher rating, the circuit breaker shall meet the requirements specified in (A) or (B), and (C).

A series-rated system is a combination of circuit breakers or fuses and circuit breakers that can be applied at available short-circuit levels above the interrupting rating of the load-side circuit breakers but not above that of the main or line-side device. Series-rated systems can consist of fuses that protect circuit breakers or of circuit breakers that protect circuit breakers. The arrangement of protective components in a series-rated system can be as specified in 240.86(A) for engineered systems applied to existing installations or in 240.86(B) for tested combinations that can be applied in any new or existing installation.

(A) Selected Under Engineering Supervision in Existing Installations. The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.

For calculated applications, the engineer shall ensure that the downstream circuit breaker(s) that are part of the series combination remain passive during the interruption period of the line side fully rated, current-limiting device.

Section 240.86(A) allows for an engineering solution at existing facilities where the available fault current is increased beyond the interrupting rating of the existing circuit overcurrent protection equipment. Examples of this increase could include changes in transformer size, transformer impedances, motor replacements, new motor installations, or utility distribution systems. An engineered system essentially redesigns the overcurrent protection scheme to accommodate the increase in available fault current. This eliminates the need for a wholesale replacement of electrical distribution equipment. Where the increase in fault current causes existing equipment to be “underrated,” the engineering approach is to provide upstream protection that functions in concert with the existing protective devices to safely open the circuit under fault conditions. The requirement specifies that the design of such systems is to be performed only by licensed professional engineers whose credentials substantiate their ability to perform this type of engineering. Documentation in the form of stamped drawings and field marking of end-use equipment to indicate it is a component of a series-rated system is required.

Designing a series-rated system requires consideration of the fault-clearing characteristics of the existing protective devices, and of their ability to interact with the newly installed upstream protective device(s) under fault conditions. An engineered series-rated system can be applied to all existing installations. The operating parameters of the existing overcurrent protection equipment dictate what can be done in a field-engineered protection scheme.

The circuit breakers that are most likely to be compatible with series-rated systems are those that will remain closed during the interruption period of the fully rated OCPD installed on their line side, and those that have an interrupting rating not less than the let-through current of an upstream protective device (such as a current-limiting fuse). In cases where the opening of a circuit breaker (under any level of fault current) begins in less than one-half cycle, the use of a field-engineered series-rated system is likely to be contrary to acceptable application

practices specified by the circuit breaker manufacturer. In an engineered system, the upstream device must operate before the downstream device for any fault that exceeds the interrupting rating of the downstream device in the series.

Where in doubt about the proper application of existing downstream circuit breakers with new upstream OCPDs, the manufacturers of the existing circuit breakers and the new upstream OCPDs must be consulted.

The safety objective of any overcurrent protection scheme is to ensure compliance with 110.9.

(B) Tested Combinations. The combination of line-side overcurrent device and load-side circuit breaker(s) is tested and marked on the end use equipment, such as switchboards and panelboards.

Informational Note to (A) and (B): See 110.22 for marking of series combination systems.

The enclosures must have a label affixed by the equipment manufacturer that provides the series rating of the combination(s). Because the equipment often does not have enough room to show all the legitimate series-rated combinations, UL 67, *Standard for Panelboards*, allows a bulletin to be referenced and supplied with the panelboard. These bulletins typically provide all the acceptable combinations. The installer of a series-rated system must also provide the additional labeling on equipment enclosures required by 110.22(C), indicating that the equipment has been applied in a series-rated system.

(C) Motor Contribution. Series ratings shall not be used where

- (1) Motors are connected on the load side of the higher-rated overcurrent device and on the line side of the lower-rated overcurrent device, and
- (2) The sum of the motor full-load currents exceeds 1 percent of the interrupting rating of the lower-rated circuit breaker.

The requirements in 240.86(C) limit the use of series-rated systems in which motors are connected between the line-side (protecting) device and the load-side (protected) circuit breaker. Exhibit 240.15 illustrates the conditions of 240.86(C).

240.87 Arc Energy Reduction. Where the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted is 1200 A or higher, 240.87(A) and (B) shall apply.

(A) Documentation. Documentation shall be available to those authorized to design, install, operate, or inspect the installation as to the location of the circuit breaker(s).

(B) Method to Reduce Clearing Time. One of the following means shall be provided:

- (1) Zone-selective interlocking
- (2) Differential relaying
- (3) Energy-reducing maintenance switching with local status indicator
- (4) Energy-reducing active arc flash mitigation system

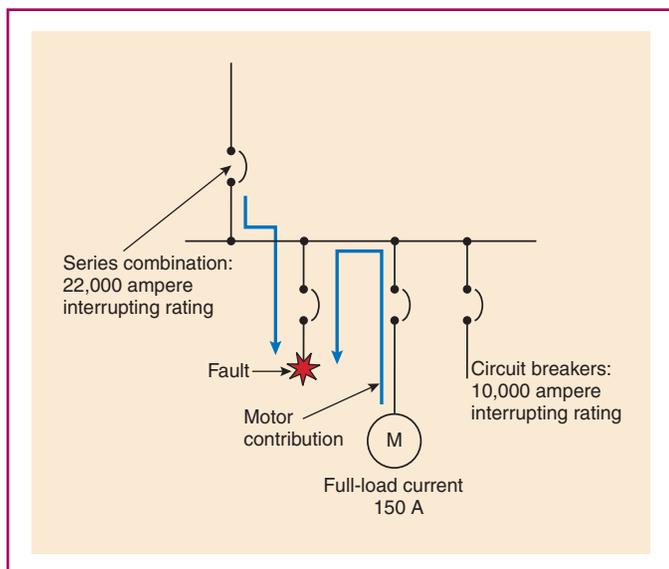

EXHIBIT 240.15 Example of an installation where the level of motor contribution exceeds 1 percent of the interrupting rating for the lowest-rated circuit breaker in this series-rated system.

- (5) An instantaneous trip setting that is less than the available arcing current
- (6) An instantaneous override that is less than the available arcing current
- (7) An approved equivalent means

Informational Note No. 1: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to “no intentional delay” to reduce the clearing time while the worker is working within an arc-flash boundary as defined in *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*, and then to set the trip unit back to a normal setting after the potentially hazardous work is complete.

Informational Note No. 2: An energy-reducing active arc flash mitigation system helps in reducing arcing duration in the electrical distribution system. No change in the circuit breaker or the settings of other devices is required during maintenance when a worker is working within an arc flash boundary as defined in *NFPA 70E-2015, Standard for Electrical Safety in the Workplace*.

Informational Note No. 3: An instantaneous trip is a function that causes a circuit breaker to trip with no intentional delay when currents exceed the instantaneous trip setting or current level. If arcing currents are above the instantaneous trip level, the circuit breaker will trip in the minimum possible time.

Informational Note No. 4: IEEE 1584–2002, *IEEE Guide for Performing Arc Flash Hazard Calculations*, is one of the available methods that provide guidance in determining arcing current.

The criteria for applying this requirement do not rely on the circuit breaker having or not having an instantaneous trip setting. The continuous current trip setting is the rating of the installed circuit breaker or trip plug installed in the circuit breaker. For devices with adjustable set points, it is the maximum rating of the installed device that is to be used, not the rating set for the specific circuit. If either of these are rated 1200 amperes or higher, then one of the methods to reduce clearing time must be employed.

Circuit breakers without the capability of an instantaneous response can be used to selectively coordinate with other OCPDs where required by the *NEC* or where incorporated as part of an electrical system design. However, a longer protective device opening time can expose the person(s) who may have initiated the fault while working on energized electrical equipment to more incident energy, thus increasing the severity of the hazard. This section identifies six specific methods that can be used to comply with this requirement and also permits use of an equivalent, which is acceptable to the AHJ. Zone-selective interlocking and differential relaying are methods that can be implemented as part of the system design and do not require any manual intervention.

An energy-reducing maintenance switch is a means by which an intentional delay in the opening of a circuit breaker can be overridden while maintenance, service, or diagnostic tasks are being performed. The circuit breaker can then be restored upon completion of the tasks to enable the system to be selectively coordinated or for other system design purposes.

An instantaneous trip setting that is below the available arcing current is a permitted method of achieving the arc energy reduction required in this section. It is critical that the available arcing current exceeds the instantaneous trip or instantaneous override for the circuit breaker to open as quickly as possible during an arcing fault. It is not enough to just require an instantaneous trip or an instantaneous override, because the arcing current could be low enough that it takes the circuit breaker from many cycles to many seconds to open. If the arcing current is greater than the instantaneous trip or instantaneous override, most circuit breakers will clear somewhere between ½ cycle (smaller molded case type) and 3 cycles (power or “air-frame” type).

The *NEC* does not prohibit the use of circuit breakers having an instantaneous capability that is adjusted to allow for a longer clearing time. This is a design consideration and is not required by this section.

Exhibit 240.16 is an example of an electronic trip unit for a circuit breaker employing an energy-reducing maintenance switch in addition to means for adjusting other settings. The function of the energy reduction

EXHIBIT 240.16 An electronic trip unit for a circuit breaker that has its instantaneous setting set to “off” and that incorporates an energy-reducing maintenance setting. (Courtesy of Eaton)

maintenance switch is to override any settings that intentionally delay the opening time of the circuit breaker. A selectively coordinated electrical system is one example of where the response time adjustments available on some circuit breakers are set to allow for localization of a fault in the circuit. When these settings are overridden, the circuit breaker responds faster to a downstream fault in the circuit. The faster response time provides the important benefit of reducing the level of incident energy that personnel may be exposed to where tasks are being performed within the arc-flash boundary. An example of a local status indicator is an LED signifying “maintenance mode,” which provides qualified persons with the indication that trip settings are adjusted to reduce incident energy should a fault occur anywhere electrically downstream of the device. See the definition of *arc-flash boundary* in NFPA 70E; see the definition of *qualified person* in Article 100.

Once the task is completed, any settings that previously introduced an intentional delay in the circuit-breaker clearing time can be restored.

Part VIII. Supervised Industrial Installations

240.90 General. Overcurrent protection in areas of supervised industrial installations shall comply with all of the other applicable provisions of this article, except as provided in Part VIII. The provisions of Part VIII shall be permitted to apply only to those portions of the electrical system in the supervised industrial installation used exclusively for manufacturing or process control activities.

Section 240.21 contains the requirements that specify the point in the circuit at which overcurrent protection for conductors must be located. Section 240.9 B) modifies 240.4(C), and 240.92 modifies the 240.21(B) and (C) requirements, based on the condition that only qualified personnel monitor and maintain the installation.

See also

240.2 for the definition and the associated commentary of *supervised industrial installation*

240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.91(A) or 240.91(B)

(A) General. Conductors shall be protected in accordance with 240.4.

(B) Devices Rated Over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95 percent of the rating of the overcurrent device specified in 240.6 in accordance with (B)(1) and (2).

- (1) The conductors are protected within recognized time vs. current limits for short-circuit currents
- (2) All equipment in which the conductors terminate is listed and marked for the application

Conductors protected by OCPDs rated more than 800 amperes must have an ampacity that is 95 percent of the rating of the OCPD. For

example, if the OCPD is rated 1000 amperes, the conductor ampacity cannot be less than 950 amperes. Calculations must be made to verify that the conductors are adequately protected during the time it takes for the OCPD to open due to a short circuit. In addition, the device and equipment in which the conductors terminate are required to be evaluated and listed by a qualified electrical testing laboratory for this specific application. The requirements in Articles 210, 215, and 230 that conductors have an ampacity not less than the calculated load being supplied still apply.

240.92 Location in Circuit. An overcurrent device shall be connected in each ungrounded circuit conductor as required in 240.92(A) through (E).

(A) Feeder and Branch-Circuit Conductors. Feeder and branch-circuit conductors shall be protected at the point the conductors receive their supply as permitted in 240.21 or as otherwise permitted in 240.92(B), (C), (D), or (E).

(B) Feeder Taps. For feeder taps specified in 240.21(B)(2), (B)(3), and (B)(4), the tap conductors shall be permitted to be sized in accordance with Table 240.92(B).

Table 240.92(B) does not modify the maximum length of the feeder taps specified in 240.21(B)(2), (B)(3), and (B)(4). It only provides an alternate method of sizing the feeder conductors.

TABLE 240.92(B) Tap Conductor Short-Circuit Current Ratings

Tap conductors are considered to be protected under short-circuit conditions when their short-circuit temperature limit is not exceeded. Conductor heating under short-circuit conditions is determined by (1) or (2):

(1) *Short-Circuit Formula for Copper Conductors*

$$(I^2/A^2)t = 0.0297 \log_{10} [(T_2 + 234)/(T_1 + 234)]$$

(2) *Short-Circuit Formula for Aluminum Conductors*

$$(I^2/A^2)t = 0.0125 \log_{10} [(T_2 + 228)/(T_1 + 228)]$$

where:

I = short-circuit current in amperes

A = conductor area in circular mils

t = time of short circuit in seconds (for times less than or equal to 10 seconds)

T_1 = initial conductor temperature in degrees Celsius

T_2 = final conductor temperature in degrees Celsius

Copper conductor with paper, rubber, varnished cloth insulation,
 $T_2 = 200$

Copper conductor with thermoplastic insulation, $T_2 = 150$

Copper conductor with cross-linked polyethylene insulation,
 $T_2 = 250$

Copper conductor with ethylene propylene rubber insulation,
 $T_2 = 250$

Aluminum conductor with paper, rubber, varnished cloth insulation, $T_2 = 200$

Aluminum conductor with thermoplastic insulation, $T_2 = 150$

Aluminum conductor with cross-linked polyethylene insulation,
 $T_2 = 250$

Aluminum conductor with ethylene propylene rubber insulation,
 $T_2 = 250$

(C) Transformer Secondary Conductors of Separately Derived Systems. Conductors shall be permitted to be connected to a transformer secondary of a separately derived system, without overcurrent protection at the connection, where the conditions of 240.92(C)(1), (C)(2), and (C)(3) are met.

(1) Short-Circuit and Ground-Fault Protection. The conductors shall be protected from short-circuit and ground-fault conditions by complying with one of the following conditions:

- (1) The length of the secondary conductors does not exceed 30 m (100 ft), and the transformer primary overcurrent device has a rating or setting that does not exceed 150 percent of the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.
- (2) The conductors are protected by a differential relay with a trip setting equal to or less than the conductor ampacity.

Informational Note: A differential relay is connected to be sensitive only to short-circuit or fault currents within the protected zone and is normally set much lower than the conductor ampacity. The differential relay is connected to trip protective devices that de-energize the protected conductors if a short-circuit condition occurs.

- (3) The conductors shall be considered to be protected if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground-fault conditions.

(2) Overload Protection. The conductors shall be protected against overload conditions by complying with one of the following:

- (1) The conductors terminate in a single overcurrent device that will limit the load to the conductor ampacity.
- (2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard or switchgear. There shall be no more than six overcurrent devices grouped in any one location.
- (3) Overcurrent relaying is connected [with a current transformer(s), if needed] to sense all of the secondary conductor current and limit the load to the conductor ampacity by opening upstream or downstream devices.
- (4) Conductors shall be considered to be protected if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors from overload conditions.

(3) Physical Protection. The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(D) Outside Feeder Taps. Outside conductors shall be permitted to be tapped to a feeder or to be connected at a transformer secondary, without overcurrent protection at the tap or connection, where all the following conditions are met:

- (1) The conductors are protected from physical damage in an approved manner.
- (2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard or switchgear. There shall be no more than six overcurrent devices grouped in any one location.
- (3) The tap conductors are installed outdoors of a building or structure except at the point of load termination.
- (4) The overcurrent device for the conductors is an integral part of a disconnecting means or is located immediately adjacent thereto.
- (5) The disconnecting means for the conductors are installed at a readily accessible location complying with one of the following:
 - a. Outside of a building or structure
 - b. Inside, nearest the point of entrance of the conductors
 - c. Where installed in accordance with 230.6, nearest the point of entrance of the conductors

Included in the requirements of 240.92(C) and (D) are criteria for longer conductor lengths, for use of differential relays as the means for providing short-circuit ground-fault protection, and for use of up to six circuit breakers or fuses as the overload protection for outside feeder taps and outside transformer secondary conductors.

(E) Protection by Primary Overcurrent Device. Conductors supplied by the secondary side of a transformer shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided the primary device time-current protection characteristic, multiplied by the maximum effective primary-to-secondary transformer voltage ratio, effectively protects the secondary conductors.

Part IX. Overcurrent Protection over 1000 Volts, Nominal

240.100 Feeders and Branch Circuits.

(A) Location and Type of Protection. Feeder and branch-circuit conductors shall have overcurrent protection in each ungrounded conductor located at the point where the conductor receives its supply or at an alternative location in the circuit when designed under engineering supervision that includes but is not limited to considering the appropriate fault studies and time-current coordination analysis of the protective devices and the conductor damage curves. The overcurrent protection shall be permitted to be provided by either 240.100(A)(1) or (A)(2).

(1) Overcurrent Relays and Current Transformers. Circuit breakers used for overcurrent protection of 3-phase circuits shall have a minimum of three overcurrent relay elements operated from three current transformers. The separate overcurrent relay elements (or protective functions) shall be permitted to be part of a single electronic protective relay unit.

On 3-phase, 3-wire circuits, an overcurrent relay element in the residual circuit of the current transformers shall be permitted to replace one of the phase relay elements.

An overcurrent relay element, operated from a current transformer that links all phases of a 3-phase, 3-wire circuit, shall be permitted to replace the residual relay element and one of the phase-conductor current transformers. Where the neutral conductor is not regrounded on the load side of the circuit as permitted in 250.184(B), the current transformer shall be permitted to link all 3-phase conductors and the grounded circuit conductor (neutral).

(2) Fuses. A fuse shall be connected in series with each ungrounded conductor.

(B) Protective Devices. The protective device(s) shall be capable of detecting and interrupting all values of current that can occur at their location in excess of their trip-setting or melting point.

(C) Conductor Protection. The operating time of the protective device, the available short-circuit current, and the conductor used shall be coordinated to prevent damaging or dangerous temperatures in conductors or conductor insulation under short-circuit conditions.

240.101 Additional Requirements for Feeders.

(A) Rating or Setting of Overcurrent Protective Devices. The continuous ampere rating of a fuse shall not exceed three times the ampacity of the conductors. The long-time trip element setting of a breaker or the minimum trip setting of an electronically actuated fuse shall not exceed six times the ampacity of the conductor. For fire pumps, conductors shall be permitted to be protected for overcurrent in accordance with 695.4(B)(2).

(B) Feeder Taps. Conductors tapped to a feeder shall be permitted to be protected by the feeder overcurrent device where that overcurrent device also protects the tap conductor.

- 250.194 Grounding and Bonding of Fences and Other Metal Structures
 - (A) Metal Fences
 - (B) Metal Structures

Part I. General

250.1 Scope. This article covers general requirements for grounding and bonding of electrical installations, and the specific requirements in (1) through (6).

- (1) Systems, circuits, and equipment required, permitted, or not permitted to be grounded
- (2) Circuit conductor to be grounded on grounded systems
- (3) Location of grounding connections
- (4) Types and sizes of grounding and bonding conductors and electrodes
- (5) Methods of grounding and bonding
- (6) Conditions under which guards, isolation, or insulation may be substituted for grounding

Informational Note: See **Figure 250.1** for information on the organization of **Article 250** covering grounding and bonding requirements.

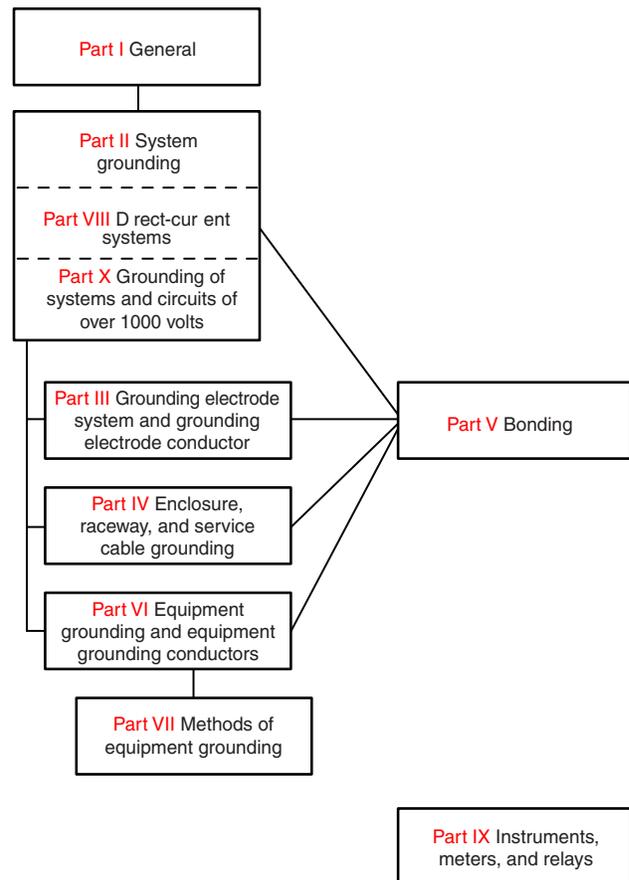

FIGURE 250.1 Grounding and Bonding.

The title of [Article 250, Grounding and Bonding](#), conveys that grounding and bonding are two separate concepts. The two concepts are not mutually exclusive, and in many cases they are directly interrelated through the requirements of [Article 250](#).

250.2 Definition.

Bonding Jumper, Supply-Side. A conductor installed on the supply side of a service or within a service equipment enclosure(s), or for a separately derived system, that ensures the required electrical conductivity between metal parts required to be electrically connected.

Metal equipment enclosures, metal raceways, and metal cable trays are examples of equipment containing supply-side conductors that are required to be bonded. Where bonding jumpers are used, they are required to be installed and sized as specified in [250.102\(A\), \(B\), \(C\), and \(E\)](#). Bonding jumpers installed on the load side of a service, feeder, or branch-circuit OCPD are *equipment bonding jumpers*.

250.3 Application of Other Articles. For other articles applying to particular cases of installation of conductors and equipment, grounding and bonding requirements are identified in [Table 250.3](#) that are in addition to, or modifications of, those of this article.

250.4 General Requirements for Grounding and Bonding.

The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in [Article 250](#) shall be followed to comply with the performance requirements of this section.

Performance-based requirements provide an overall objective without mandating specifics for accomplishing that objective. The requirements of [250.4](#) do not provide a specific rule for the sizing or connection of grounding conductors. Rather, the section outlines overall performance objectives for grounding conductors as applied to both grounded and ungrounded systems.

(A) Grounded Systems.

(1) Electrical System Grounding. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.

Informational Note No. 1: An important consideration for limiting the imposed voltage is the routing of bonding and grounding electrode conductors so that they are not any longer than necessary to complete the connection without disturbing the permanent parts of the installation and so that unnecessary bends and loops are avoided.

Informational Note No. 2: See NFPA 780-2014, *Standard for the Installation of Lightning Protection Systems*, for information on installation of grounding and bonding for lightning protection systems.

(2) Grounding of Electrical Equipment. Normally non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Normally non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment. Normally non-current-carrying electrically conductive materials that are likely to become energized shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

(5) Effective Ground-Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a low-impedance circuit facilitating the operation of the overcurrent device or ground detector for high-impedance grounded systems. It shall be capable of safely carrying the maximum ground-fault current likely to be imposed on it from any point on the wiring system where a ground fault may occur to the electrical supply source. The earth shall not be considered as an effective ground-fault current path.

The performance objective for the effective ground-fault current path is not always to facilitate operation of an OCPD. For high-impedance grounded systems, for example the performance objective is to ensure operation of the required ground detector in order to activate some type of an alarm or other signal indicating the existence of a ground-fault condition.

(B) Ungrounded Systems.

(1) Grounding Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with higher-voltage lines and limit the voltage to ground on these materials.

Informational Note: See NFPA 780-2014, *Standard for the Installation of Lightning Protection Systems*, for information on installation of grounding and bonding for lightning protection systems.

(2) Bonding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a low-impedance path for ground-fault current that is capable of carrying the maximum fault current likely to be imposed on it.

TABLE 250.3 *Additional Grounding and Bonding Requirements*

Conductor/Equipment	Article	Section
Agricultural buildings		547.9 and 547.10
Audio signal processing, amplification, and reproduction equipment		640.7
Branch circuits		210.5, 210.6, 406.3
Cablebus		370.9
Cable trays	392	392.60
Capacitors		460.10, 460.27
Circuits and equipment operating at less than 50 volts	720	
Communications circuits	800	
Community antenna television and radio distribution systems		820.93, 820.100, 820.103, 820.106
Conductors for general wiring	310	
Cranes and hoists	610	
Electrically driven or controlled irrigation machines		675.11(C), 675.12, 675.13, 675.14, 675.15
Electric signs and outline lighting	600	
Electrolytic cells	668	
Elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chairlifts	620	
Fixed electric heating equipment for pipelines and vessels		427.29, 427.48
Fixed outdoor electric deicing and snow-melting equipment		426.27
Flexible cords and cables		400.22, 400.23
Floating buildings		553.8, 553.10, 553.11
Grounding-type receptacles, adapters, cord connectors, and attachment plugs		406.9
Hazardous (classified) locations	500–517	
Health care facilities	517	
Induction and dielectric heating equipment	665	
Industrial machinery	670	
Information technology equipment		645.15
Intrinsically safe systems		504.50
Luminaires and lighting equipment		410.40, 410.42, 410.46, 410.155(B)
Luminaires, lampholders, and lamps	410	
Marinas and boatyards		555.15
Mobile homes and mobile home park	550	
Motion picture and television studios and similar locations		530.20, 530.64(B)
Motors, motor circuits, and controllers	430	
Natural and artificially made bodies of water	682	682.30, 682.31, 682.32, 682.33
Network powered broadband communications circuits		830.93, 830.100, 830.106
Optical fiber cables		770.100
Outlet, device, pull, and junction boxes; conduit bodies; and fittings		314.4, 314.25
Over 600 volts, nominal, underground wiring methods		300.50(C)
Panelboards		408.40
Pipe organs	650	
Radio and television equipment	810	
Receptacles and cord connectors		406.3
Recreational vehicles and recreational vehicle parks	551	
Services	230	
Solar photovoltaic systems		690.41, 690.42, 690.43, 690.45, 690.47
Swimming pools, fountains, and similar installations	680	
Switchboards and panelboards		408.3(D)
Switches		404.12
Theaters, audience areas of motion picture and television studios, and similar locations		520.81
Transformers and transformer vaults		450.10
Use and identification of grounded conductors	200	
X-ray equipment	660	517.78

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that are likely to become energized shall be connected together and to the supply system grounded equipment in a manner that creates a low-impedance path for ground-fault current that is capable of carrying the maximum fault current likely to be imposed on it.

(4) Path for Fault Current. Electrical equipment, wiring, and other electrically conductive material likely to become energized shall be installed in a manner that creates a low-impedance circuit from any point on the wiring system to the electrical supply source to facilitate the operation of overcurrent devices should a second ground fault from a different phase occur on the wiring system. The earth shall not be considered as an effective fault-current path.

The performance requirements for grounding in both grounded and ungrounded systems can be categorized into two functions: system grounding and equipment grounding. These two functions are kept separate except at the point of supply, such as at the service equipment or at a separately derived system.

Grounding is the intentional connection of a current-carrying conductor to ground or to something that serves in place of ground. In most instances, this connection is made at the supply source, such as a transformer, and at the main service disconnecting means of the premises using the energy. Where a system operates “ungrounded,” it does not have an intentionally grounded circuit conductor, but equipment grounding through the use of an equipment grounding conductor (EGC) is required.

The two reasons for grounding are as follows:

1. To limit the voltages caused by lightning or by accidental contact of the supply conductors with conductors of higher voltage
2. To stabilize the voltage under normal operating conditions (which maintains the voltage at one level relative to ground, so that any equipment connected to the system will be subject only to that potential difference)

Exhibit 250.1 shows a grounded single-phase, 3-wire service supplied from a utility transformer. Inside the service disconnecting means enclosure, the grounded conductor of the system is intentionally connected to a grounding electrode via the grounding electrode conductor. Bonding the equipment grounding bus to the grounded or neutral bus within this enclosure provides a ground reference for exposed non-current-carrying parts of the electrical system. It also provides a circuit for ground-fault current through the grounded service conductor back to the utility transformer (source of supply). At the utility transformer, often an additional connection is made from the grounded conductor to a separate grounding electrode. This bonding of the EGC bus to the neutral bus facilitates the operation of OCPDs or relays under ground-fault conditions, not the connection to earth.

250.6 Objectionable Current.

(A) Arrangement to Prevent Objectionable Current. The grounding of electrical systems, circuit conductors, surge arresters, surge-protective devices, and conductive normally

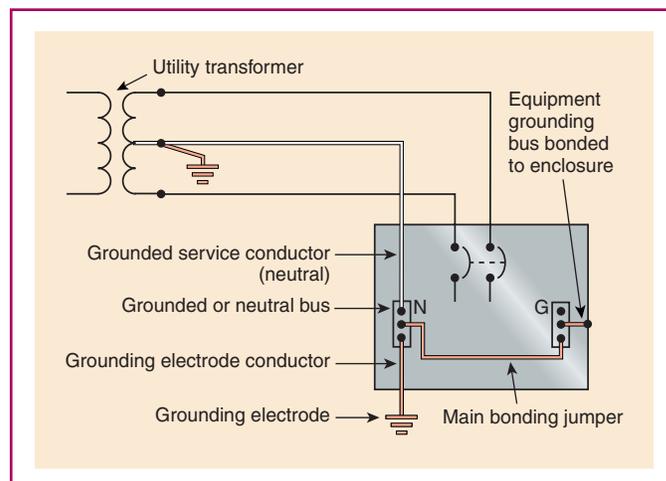

EXHIBIT 250.1 Grounding and bonding arrangement for a single-phase, 3-wire service.

non-current-carrying metal parts of equipment shall be installed and arranged in a manner that will prevent objectionable current.

(B) Alterations to Stop Objectionable Current. If the use of multiple grounding connections results in objectionable current and the requirements of 250.4(A)(5) or (B)(4) are met, one or more of the following alterations shall be permitted:

- (1) Discontinue one or more but not all of such grounding connections.
- (2) Change the locations of the grounding connections.
- (3) Interrupt the continuity of the conductor or conductive path causing the objectionable current.
- (4) Take other suitable remedial and approved action.

Some electronic equipment is sensitive to stray currents. Circulating currents on EGCs, metal raceways, and building steel develop potential differences between ground and the neutral of electronic equipment. Installation designers must look for ways to isolate electronic equipment from the effects of such stray circulating currents.

Isolating the electronic equipment from all other power equipment by disconnecting it from the power equipment ground is not the right solution, nor is removing the equipment grounding means or adding non-metallic spacers in the metallic raceway system. These solutions are contrary to fundamental safety grounding principles covered in the requirements of Article 250. Furthermore, if the electronic equipment is grounded to an earth ground that is isolated from the common power system ground, a potential difference can be created, which is a shock hazard. The error is compounded because such isolation does not establish a low-impedance ground-fault return path to the power source, which is necessary to actuate the OCPD. Section 250.6(B) does not permit disconnection of all power grounding connections to the electronic equipment.

See also

250.6(D) and its commentary for limitations to alterations

(C) Temporary Currents Not Classified as Objectionable Currents. Temporary currents resulting from abnormal

conditions, such as ground faults, shall not be classified as objectionable current for the purposes specified in 250.6(A) and (B).

(D) Limitations to Permissible Alterations. The provisions of this section shall not be considered as permitting electronic equipment from being operated on ac systems or branch circuits that are not connected to an equipment grounding conductor as required by this article. Currents that introduce noise or data errors in electronic equipment shall not be considered the objectionable currents addressed in this section.

Section 250.6(D) indicates that currents that result in noise or data errors in electronic equipment are not considered to be the objectionable currents referred to in 250.6, which limits the alterations permitted by 250.6(B).

See also

250.96(B) and 250.146(D) for requirements that provide safe bonding and grounding methods to minimize noise and data errors

(E) Isolation of Objectionable Direct-Current Ground Currents. Where isolation of objectionable dc ground currents from cathodic protection systems is required, a listed ac coupling/dc isolating device shall be permitted in the equipment grounding conductor path to provide an effective return path for ac ground-fault current while blocking dc current.

The listed ac coupling/dc isolating device allowed by this section blocks the dc current on grounding and bonding conductors and allows the ground-fault return path to function properly. These devices are evaluated by a product testing organization for proper performance under ground-fault conditions.

Where cathodic protection for the piping system is provided, the required grounding and bonding connections associated with metal piping systems allow dc current to be imposed on grounding and bonding conductors.

250.8 Connection of Grounding and Bonding Equipment.

(A) Permitted Methods. Equipment grounding conductors, grounding electrode conductors, and bonding jumpers shall be connected by one or more of the following means:

- (1) Listed pressure connectors
- (2) Terminal bars
- (3) Pressure connectors listed as grounding and bonding equipment
- (4) Exothermic welding process
- (5) Machine screw-type fasteners that engage not less than two threads or are secured with a nut
- (6) Thread-forming machine screws that engage not less than two threads in the enclosure
- (7) Connections that are part of a listed assembly
- (8) Other listed means

By specifically identifying machine screws and thread-forming machine screws as acceptable connection methods, this section does not permit another type of screw (sheet metal screw or drywall screw) be used for the connection of grounding and bonding conductors or terminals.

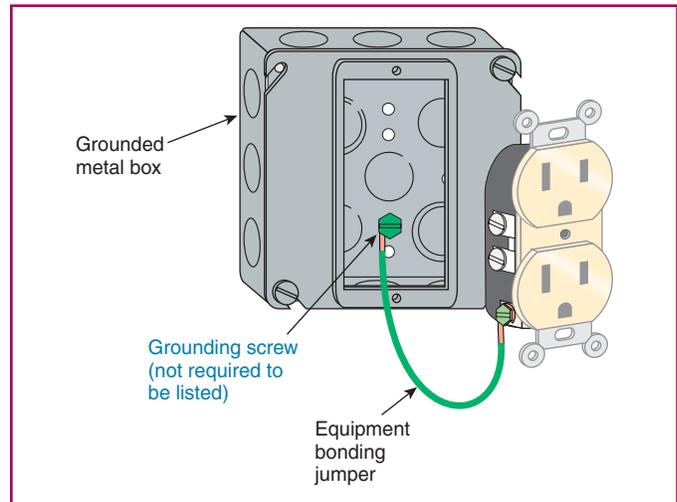

EXHIBIT 250.2 Use of a grounding screw to attach an equipment bonding jumper to a metal box.

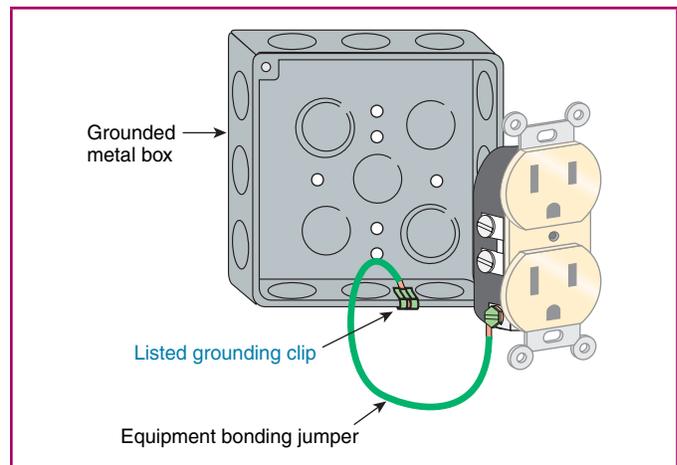

EXHIBIT 250.3 Use of a listed grounding clip to attach an equipment bonding jumper to a metal box.

Listed pressure connectors, such as twist-on wire connectors, do not have to be specifically listed for grounding and bonding. The use of listed pressure connectors other than those that are green in color is permitted for the connection of grounding and bonding conductors. Exhibits 250.2 and 250.3 illustrate two acceptable methods of attaching an equipment bonding jumper to a grounded metal box.

(B) Methods Not Permitted. Connection devices or fittings that depend solely on solder shall not be used.

250.10 Protection of Ground Clamps and Fittings. Ground clamps or other fittings exposed to physical damage shall be enclosed in metal, wood, or equivalent protective covering.

250.12 Clean Surfaces. Nonconductive coatings (such as paint, lacquer, and enamel) on equipment to be grounded shall be removed from threads and other contact surfaces to ensure good electrical continuity or be connected by means of fittings designed so as to make such removal unnecessary.

EXHIBIT 250.4 Locknut designed to cut through a painted surface as it is tightened. (Courtesy of Thomas and Betts, a Member of the ABB Group)

Certain fittings, such as locknuts and star washers, can be designed to ensure good electrical continuity to the contact surface through nonconductive coatings. Exhibit 250.4 shows an example of a locknut that is intended to provide electrical continuity by removing the nonconductive coating as the locknut is tightened.

Part II. System Grounding

250.20 Alternating-Current Systems to Be Grounded.

Alternating-current systems shall be grounded as provided for in 250.20(A), (B), (C), or (D). Other systems shall be permitted to be grounded. If such systems are grounded, they shall comply with the applicable provisions of this article.

Informational Note: An example of a system permitted to be grounded is a corner-grounded delta transformer connection. See 250.26(4) for conductor to be grounded.

(A) Alternating-Current Systems of Less Than 50 Volts.

Alternating-current systems of less than 50 volts shall be grounded under any of the following conditions:

- (1) Where supplied by transformers, if the transformer supply system exceeds 150 volts to ground
- (2) Where supplied by transformers, if the transformer supply system is ungrounded
- (3) Where installed outside as overhead conductors

(B) Alternating-Current Systems of 50 Volts to 1000 Volts.

Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems shall be grounded under any of the following conditions:

- (1) Where the system can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed 150 volts

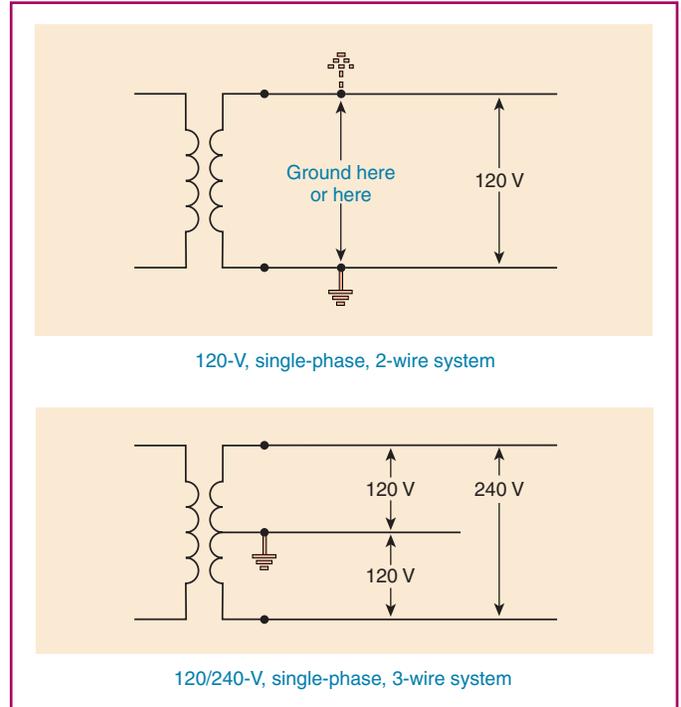

EXHIBIT 250.5 Typical conductor grounding requirements for 120-volt and 120/240-volt systems.

Exhibit 250.5 illustrates the grounding requirements of 250.20(B)(1) for a 120-volt, single-phase, 2-wire system and for a 120/240-volt, single-phase, 3-wire system. The selection of which conductor to be grounded is covered in 250.26.

- (2) Where the system is 3-phase, 4-wire, wye connected in which the neutral conductor is used as a circuit conductor
- (3) Where the system is 3-phase, 4-wire, delta connected in which the midpoint of one phase winding is used as a circuit conductor

Exhibit 250.6 illustrates a 3-phase, 4-wire, wye-connected system covered by 250.20(B)(2). Because this system supplies line-to-neutral connected loads in addition to line-to-line connected loads, the neutral conductor is required to be grounded.

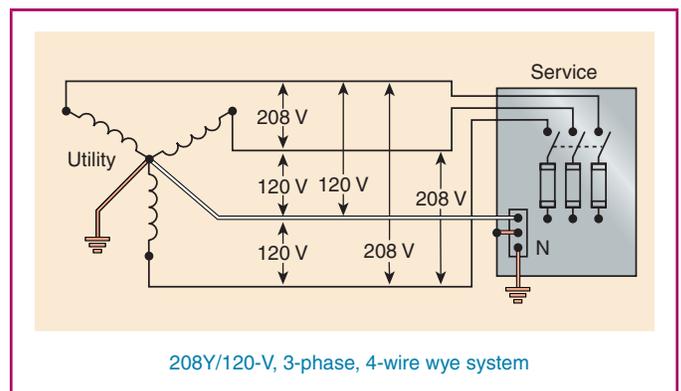

EXHIBIT 250.6 A typical system supplying line-to-neutral connected loads in addition to line-to-line connected loads in which the neutral conductor is required to be grounded.

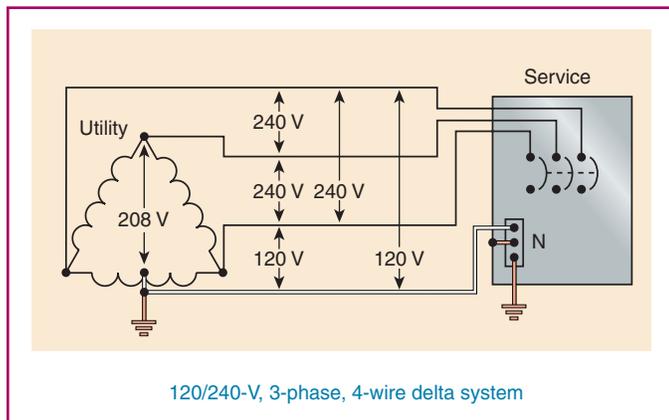

EXHIBIT 250.7 A typical system in which the midpoint of one phase winding is used as a circuit conductor.

Exhibit 250.7 shows a 3-phase, 4-wire, delta-connected system covered by 250.20(B)(3). A connection is made at the midpoint of one phase to enable line-to-neutral loads to be supplied. The same voltage is developed between this grounded conductor and the two phase conductors connected at either end of the winding that is midpoint grounded. The voltage between the third phase conductor and the grounded conductor is higher, and other requirements in the *NEC*® cover the arrangement and identification of the “high leg” in this system.

See also

250.26 for requirements covering which conductor is to be grounded

(C) Alternating-Current Systems of over 1000 Volts.

Alternating-current systems supplying mobile or portable equipment shall be grounded as specified in 250.188. Where supplying other than mobile or portable equipment, such systems shall be permitted to be grounded.

(D) Impedance Grounded Neutral Systems. Impedance grounded neutral systems shall be grounded in accordance with 250.36 or 250.187.

250.21 Alternating-Current Systems of 50 Volts to 1000 Volts Not Required to Be Grounded.

(A) General. The following ac systems of 50 volts to 1000 volts shall be permitted to be grounded but shall not be required to be grounded:

- (1) Electrical systems used exclusively to supply industrial electric furnaces for melting, refining, tempering, and the like
- (2) Separately derived systems used exclusively for rectifiers that supply only adjustable-speed industrial drives
- (3) Separately derived systems supplied by transformers that have a primary voltage rating of 1000 volts or less if all the following conditions are met:
 - a. The system is used exclusively for control circuits.
 - b. The conditions of maintenance and supervision ensure that only qualified persons service the installation.
 - c. Continuity of control power is required.

- (4) Other systems that are not required to be grounded in accordance with the requirements of 250.20(B)

Ungrounded systems are systems without an intentionally grounded circuit conductor used in normal circuit operation. Systems that normally operate as grounded systems — such as 120/240-volt, single-phase, 3-wire; 208Y/120-volt, 3-phase, 4-wire; and 480Y/277-volt, 3-phase, 4-wire systems — can be operated as ungrounded systems where specifically permitted by the *NEC*. A system that operates without a grounded conductor is not exempt from complying with Article 250 for equipment grounding and the required electrode grounding system.

Delta-connected, 3-phase, 3-wire, 240-volt and 480-volt systems are examples of common electrical distribution systems that are permitted but are not required to have a circuit conductor that is intentionally grounded. The operational advantage of using an ungrounded electrical system is continuity of operation, which in some processes might be a safer condition than that created by the automatic and unplanned opening of the supply circuit. The disadvantage of operating systems ungrounded is increased susceptibility to high transient voltages that can hasten insulation deterioration. As stated in 250.4(A)(1), limiting voltage impressed on the system due to lightning or line surges is a primary function of system grounding. In some limited applications, it may be desirable to not establish a voltage to ground. However, the consensus has been that for general applications, grounded systems provide a higher level of safety.

Unlike solidly grounded systems, in which the first line-to-ground fault causes the OCPD to automatically open the circuit, the same line-to-ground fault in an ungrounded system instead results in the faulted circuit conductor becoming a grounded conductor until the damaged conductor insulation can be repaired. However, this ground-fault may become a hazard if it is undetected. Ground detectors are installed in ungrounded systems to detect such faults. A second insulation failure on a different ungrounded conductor would result in a line to line-to-ground fault, with the potential for more extensive damage to electrical equipment.

(B) Ground Detectors. Ground detectors shall be installed in accordance with 250.21(B)(1) and (B)(2).

- (1) Ungrounded ac systems as permitted in 250.21(A)(1) through (A)(4) operating at not less than 120 volts and at 1000 volts or less shall have ground detectors installed on the system.
- (2) The ground detection sensing equipment shall be connected as close as practicable to where the system receives its supply.

Ground detectors provide a visual indication, an audible signal, or both, to alert system operators and maintenance personnel of a ground-fault condition in the electrical system. The notification of the ground-fault condition, rather than automatic interruption of the circuit, allows the operators of the process to take the necessary steps to initiate an orderly shutdown, to determine where the ground fault is located, and to safely repair the fault.

(C) Marking. Ungrounded systems shall be legibly marked “Caution: Ungrounded System Operating — _____ Volts Between Conductors” at the source or first disconnecting means

of the system. The marking shall be of sufficient durability to withstand the environment involved.

Section 250.21(C) incorporates the safety warning marking requirements from 408.3(F)(2).

250.22 Circuits Not to Be Grounded. The following circuits shall not be grounded:

- (1) Circuits for electric cranes operating over combustible fibers in Class III locations, as provided in 503.155
- (2) Circuits in health care facilities as provided in 517.61 and 517.160
- (3) Circuits for equipment within electrolytic cell line working zones as provided in Article 668
- (4) Secondary circuits of lighting systems as provided in 411.6(A)
- (5) Secondary circuits of lighting systems as provided in 680.23(A)(2)
- (6) Class 2 load side circuits for suspended ceiling low-voltage power grid distribution systems as provided in 393.60(B)

250.24 Grounding Service-Supplied Alternating-Current Systems.

(A) System Grounding Connections. A premises wiring system supplied by a grounded ac service shall have a grounding electrode conductor connected to the grounded service conductor, at each service, in accordance with 250.24(A)(1) through (A)(5).

The grounded conductor of an ac service is connected to a grounding electrode system to limit the voltage to ground imposed on the system by lightning, line surges, and unintentional high voltage crossovers. This connection also stabilizes the voltage to ground during operation, including short circuits.

See also

250.4(A) and (B) for the performance requirements for these connections

(1) General. The grounding electrode conductor connection shall be made at any accessible point from the load end of the overhead service conductors, service drop, underground service conductors, or service lateral to, including the terminal or bus to which the grounded service conductor is connected at the service disconnecting means.

Informational Note: See definitions of *Service Conductors, Overhead; Service Conductors, Underground; Service Drop;* and *Service Lateral* in Article 100.

Allowing various connection locations meets the overall objectives for grounding while permitting a variety of practical options. Exhibit 250.8 illustrates three possible connection points where the grounding electrode conductor is permitted to be connected to the grounded service conductor. The accessibility of a point of connection has to be determined by the AHJ based on local conditions such as locked meter socket enclosures.

(2) Outdoor Transformer. Where the transformer supplying the service is located outside the building, at least one additional

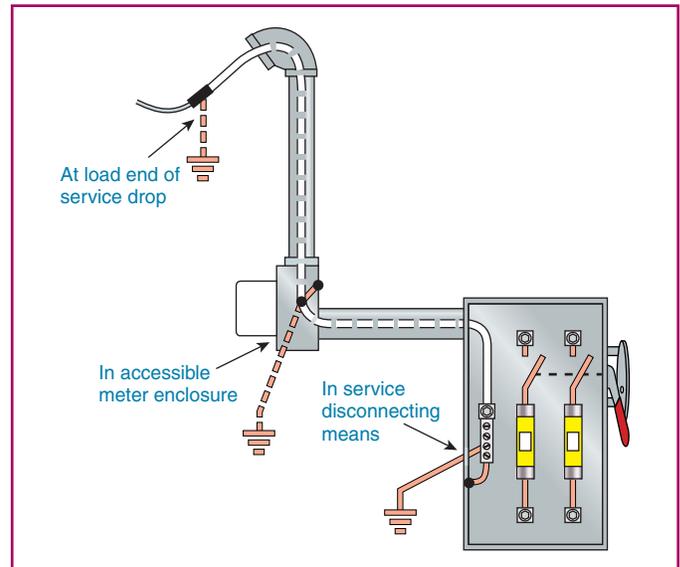

EXHIBIT 250.8 Three locations where the grounding electrode conductor is permitted to be connected to the grounded service conductor.

grounding connection shall be made from the grounded service conductor to a grounding electrode, either at the transformer or elsewhere outside the building.

Exception: The additional grounding electrode conductor connection shall not be made on high-impedance grounded neutral systems. The system shall meet the requirements of 250.36.

Outdoor installations are susceptible to lightning as well as accidental primary-to-secondary crossovers. The connection outside of a building helps mitigate the effects of these influences on the interior portion of the premises wiring system. Exhibit 250.9 illustrates two grounding

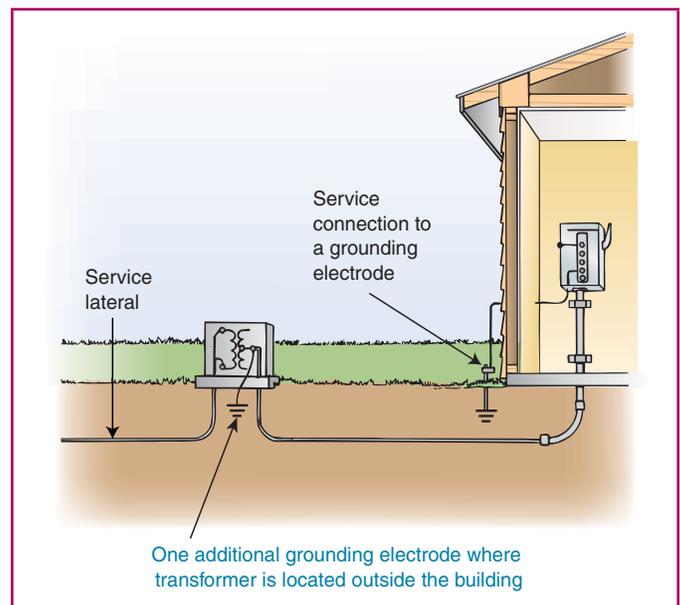

EXHIBIT 250.9 Grounding connection to the grounded conductor at the transformer and at the service.

electrode connections — one at the service equipment installed inside the building and one installed at the transformer — located outside of the building as required by 250.24(A)(2).

(3) Dual-Fed Services. For services that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single grounding electrode conductor connection to the tie point of the grounded conductor(s) from each power source shall be permitted.

(4) Main Bonding Jumper as Wire or Busbar. Where the main bonding jumper specified in 250.28 is a wire or busbar and is installed from the grounded conductor terminal bar or bus to the equipment grounding terminal bar or bus in the service equipment, the grounding electrode conductor shall be permitted to be connected to the equipment grounding terminal, bar, or bus to which the main bonding jumper is connected.

(5) Load-Side Grounding Connections. A grounded conductor shall not be connected to normally non-current-carrying metal parts of equipment, to equipment grounding conductor(s), or be reconnected to ground on the load side of the service disconnecting means except as otherwise permitted in this article.

Informational Note: See 250.30 for separately derived systems, 250.32 for connections at separate buildings or structures, and 250.142 for use of the grounded circuit conductor for grounding equipment.

Section 250.24(A)(5) prohibits re-grounding of the grounded conductor on the load side of the service disconnecting means. This correlates with the requirement of 250.142(B), which is a general prohibition on the use of the grounded conductor for grounding equipment. This prevents parallel paths for neutral current on the load side of the service disconnecting means. Parallel paths could include metal raceways, metal piping systems, metal ductwork, structural steel, and other continuous metal paths that are not intended to be current-carrying conductors under normal conditions.

(B) Main Bonding Jumper. For a grounded system, an unspliced main bonding jumper shall be used to connect the equipment grounding conductor(s) and the service-disconnect enclosure to the grounded conductor within the enclosure for each service disconnect in accordance with 250.28.

Where the service equipment of a grounded system consists of multiple disconnecting means, a main bonding jumper for each separate service disconnecting means is required to connect the grounded service conductor, the EGC, and the service equipment enclosure. The size of the main bonding jumper in each enclosure is determined in accordance with 250.28(D)(1). See Exhibit 250.10.

Exception No. 1: Where more than one service disconnecting means is located in an assembly listed for use as service equipment, an unspliced main bonding jumper shall bond the grounded conductor(s) to the assembly enclosure.

Where multiple service disconnecting means are part of an assembly listed as service equipment, all grounded service conductors are required to be run to and bonded to the assembly. However, only one section of

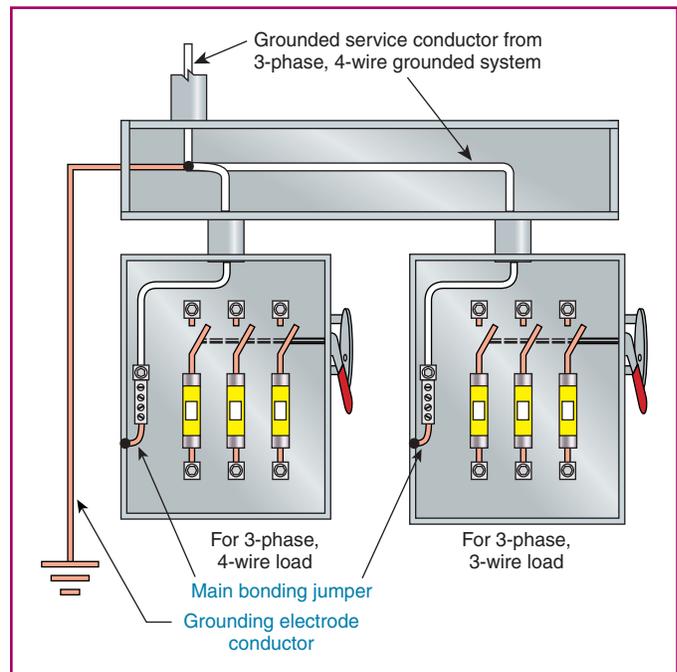

EXHIBIT 250.10 A grounded system in which the grounded service conductor is bonded to the enclosure supplying 3-phase, 4-wire service loads and to the enclosure supplying 3-phase, 3-wire loads.

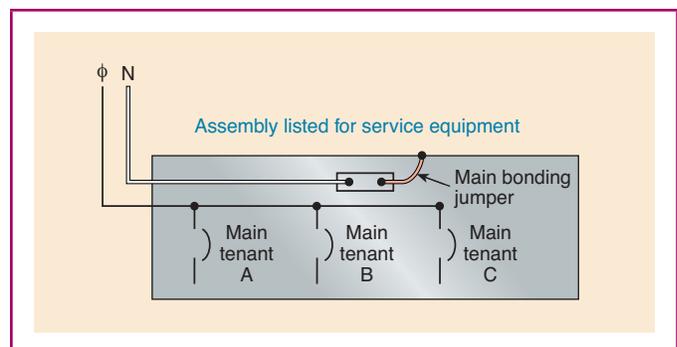

EXHIBIT 250.11 One connection of the grounded service conductor to a listed service assembly containing multiple service disconnecting means.

the assembly is required to have the main bonding jumper connection. See Exhibit 250.11.

Exception No. 2: Impedance grounded neutral systems shall be permitted to be connected as provided in 250.36 and 250.187.

(C) Grounded Conductor Brought to Service Equipment. Where an ac system operating at 1000 volts or less is grounded at any point, the grounded conductor(s) shall be routed with the ungrounded conductors to each service disconnecting means and shall be connected to each disconnecting means grounded conductor(s) terminal or bus. A main bonding jumper shall connect the grounded conductor(s) to each service disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 250.24(C)(1) through 250.24(C)(4).

Exception: Where two or more service disconnecting means are located in a single assembly listed for use as service equipment, it shall be permitted to connect the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus. The assembly shall include a main bonding jumper for connecting the grounded conductor(s) to the assembly enclosure.

If the utility service supplying the premises wiring system is grounded, the grounded conductor must be run to the service equipment, regardless of whether or not line-to-neutral loads are supplied. The conductor must be bonded to the equipment and be connected to a grounding electrode system. [Exhibit 250.10](#) shows an example of the main rule in [250.24\(C\)](#), which requires the grounded service conductor to be installed and bonded to each service disconnecting means enclosure. On the line side of the service disconnecting means, the grounded conductor is used to complete the ground-fault current path between the service equipment and the utility source. The exception to [250.24\(C\)](#) permits a single connection of the grounded service conductor to a listed service assembly (such as a switchboard) that contains more than one service disconnecting means, as shown in [Exhibit 250.11](#).

(1) Sizing for a Single Raceway or Cable. The grounded conductor shall not be smaller than specified in [Table 250.102\(C\)\(1\)](#).

(2) Parallel Conductors in Two or More Raceways or Cables. If the ungrounded service-entrance conductors are installed in parallel in two or more raceways or cables, the grounded conductor shall also be installed in parallel. The size of the grounded conductor in each raceway or cable shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or cable, as indicated in [250.24\(C\)\(1\)](#), but not smaller than 1/0 AWG.

Informational Note: See [310.10\(H\)](#) for grounded conductors connected in parallel.

Although the cumulative size of the parallel grounded conductors may be larger than is required by [250.24\(C\)\(1\)](#), the minimum 1/0 AWG per raceway or cable correlates with the requirements for parallel conductors contained in [310.10\(H\)](#).

(3) Delta-Connected Service. The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.

(4) High Impedance. The grounded conductor on a high-impedance grounded neutral system shall be grounded in accordance with [250.36](#).

(D) Grounding Electrode Conductor. A grounding electrode conductor shall be used to connect the equipment grounding conductors, the service-equipment enclosures, and, where the system is grounded, the grounded service conductor to the grounding electrode(s) required by [Part III](#) of this article. This conductor shall be sized in accordance with [250.66](#).

High-impedance grounded neutral system connections shall be made as covered in [250.36](#).

(E) Ungrounded System Grounding Connections. A premises wiring system that is supplied by an ac service that is

ungrounded shall have, at each service, a grounding electrode conductor connected to the grounding electrode(s) required by [Part III](#) of this article. The grounding electrode conductor shall be connected to a metal enclosure of the service conductors at any accessible point from the load end of the overhead service conductors, service drop, underground service conductors, or service lateral to the service disconnecting means.

250.26 Conductor to Be Grounded — Alternating-Current Systems. For ac premises wiring systems, the conductor to be grounded shall be as specified in the following:

- (1) Single-phase, 2-wire — one conductor
- (2) Single-phase, 3-wire — the neutral conductor
- (3) Multiphase systems having one wire common to all phases — the neutral conductor
- (4) Multiphase systems where one phase is grounded — one phase conductor
- (5) Multiphase systems in which one phase is used as in (2) — the neutral conductor

250.28 Main Bonding Jumper and System Bonding Jumper. For a grounded system, main bonding jumpers and system bonding jumpers shall be installed as follows:

The system bonding jumper performs the same electrical function as the main bonding jumper in a grounded ac system by connecting the EGC(s) to the grounded circuit conductor either at the source of a separately derived system or at the first disconnecting means supplied by the source. The term *system bonding jumper* is used to distinguish it from the main bonding jumper which is installed in service equipment. See the commentary following the definition of *bonding jumper, system* in [Article 100](#).

(A) Material. Main bonding jumpers and system bonding jumpers shall be of copper or other corrosion-resistant material. A main bonding jumper and a system bonding jumper shall be a wire, bus, screw, or similar suitable conductor.

(B) Construction. Where a main bonding jumper or a system bonding jumper is a screw only, the screw shall be identified with a green finish that shall be visible with the screw installed.

This identification requirement makes it possible to readily distinguish the bonding jumper screw from other screws in the grounded conductor terminal bar to ensure that the required bonding connection has been made.

(C) Attachment. Main bonding jumpers and system bonding jumpers shall be connected in the manner specified by the applicable provisions of [250.8](#).

(D) Size. Main bonding jumpers and system bonding jumpers shall be sized in accordance with [250.28\(D\)\(1\)](#) through (D)(3).

(1) General. Main bonding jumpers and system bonding jumpers shall not be smaller than specified in [Table 250.102\(C\)\(1\)](#).

(2) Main Bonding Jumper for Service with More Than One Enclosure. Where a service consists of more than a single enclosure

CLOSER LOOK: Sizing Main and System Bonding Jumpers**General**

In a grounded system, the primary function of the main bonding jumper and of the system bonding jumper is to create the link for ground-fault current between the EGCs and the grounded conductor. Table 250.102(C)(1) is used to establish the minimum size of main and system bonding jumpers. Unlike the grounding electrode conductor, which carries current to the ground (via connection to a grounding electrode), the main and system bonding jumpers are placed directly in the supply-side ground-fault current return path.

Where the largest ungrounded supply conductor exceeds the parameters of Table 250.102(C)(1), Note 1 requires a proportional relationship between the ungrounded conductor and the main or system bonding jumper. Where the service-entrance conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper must have a cross-sectional area of not less than 12½ percent of the cross-sectional area of the largest phase conductor or largest phase conductor set. In equipment such as panelboards or switchboards that are listed for use as service equipment, the manufacturer provides a bonding jumper that can be installed as the main or system bonding jumper. It is not necessary to provide an additional bonding jumper.

Main Bonding Jumper for Service with More Than One Enclosure

Where a service consists of more than one disconnecting means in separate enclosures, each enclosure is treated separately, as depicted in Exhibit 250.12. Based on the 3/0 AWG ungrounded service conductors and Table 250.102(C)(1), the minimum-size main bonding jumper for the enclosure on the left is 4 AWG copper. Similarly, the 1/0 AWG main bonding jumper for the enclosure on the right is derived from Table 250.102(C)(1) using the 500 kcmil ungrounded service conductors.

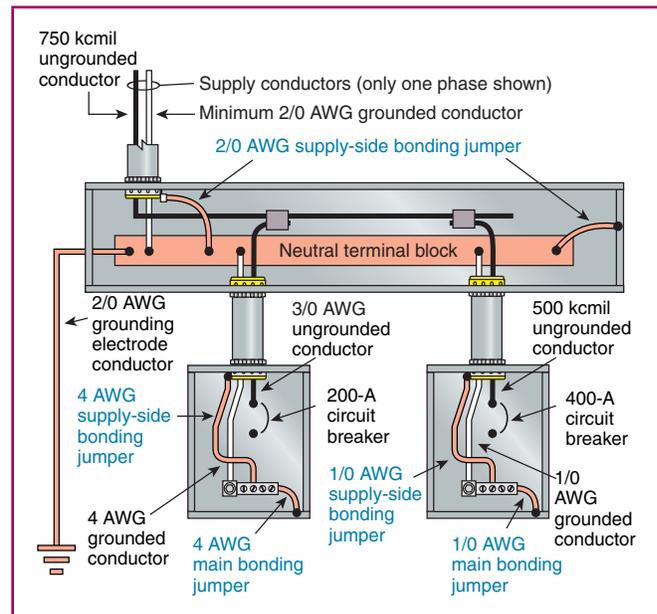

EXHIBIT 250.12 An example of the bonding requirements for service equipment.

Separately Derived System with More Than One Enclosure

To prevent parallel neutral current paths on raceways and enclosures, the system bonding jumper can either be internal to the panelboards or installed at the separately derived system enclosure so that it connects any supply-side bonding jumpers to the system grounded conductor terminal. The system bonding jumper is not permitted to be installed at both locations.

as permitted in 230.71(A), the main bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure.

(3) Separately Derived System with More Than One Enclosure.

Where a separately derived system supplies more than a single enclosure, the system bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded feeder conductor serving that enclosure, or a single system bonding jumper shall be installed at the source and sized in accordance with 250.28(D)(1) based on the equivalent size of the largest supply conductor determined by the largest sum of the areas of the corresponding conductors of each set.

See the accompanying Closer Look feature about sizing main and system bonding jumpers for more information.

250.30 Grounding Separately Derived Alternating-Current Systems. In addition to complying with 250.30(A) for grounded

systems, or as provided in 250.30(B) for ungrounded systems, separately derived systems shall comply with 250.20, 250.21, 250.22, or 250.26, as applicable. Multiple separately derived systems that are connected in parallel shall be installed in accordance with 250.30.

Informational Note No. 1: An alternate ac power source, such as an on-site generator, is not a separately derived system if the grounded conductor is solidly interconnected to a service-supplied system grounded conductor. An example of such a situation is where alternate source transfer equipment does not include a switching action in the grounded conductor and allows it to remain solidly connected to the service-supplied grounded conductor when the alternate source is operational and supplying the load served.

Informational Note No. 2: See 445.13 for the minimum size of conductors that carry fault current.

In Exhibit 250.13, the neutral conductor from the generator to the load is not disconnected by the transfer switch. The system has a direct

Application Example 1

A service is supplied by four 500 kcmil conductors in parallel for each phase. The minimum cross-sectional area of the bonding jumper is calculated as follows:

$$4 \times 500 \text{ kcmil} = 2000 \text{ kcmil}$$

Therefore, the main or system bonding jumper cannot be less than 12½ percent of 2000 kcmil, which results in a 250 kcmil copper conductor. The copper grounding electrode conductor for this set of conductors, based on Table 250.66, is not required to be larger than 3/0 AWG.

Application Example 2

System Bonding Jumpers at Panelboards

A 225-kVA transformer supplies three 3-phase, 208Y/120-V secondary feeders. Two sets of 3/0 AWG copper, THHW, ungrounded conductors terminate in panelboards with 200-A main breakers. One set of 3 AWG copper, THHW, ungrounded conductors terminates in a panelboard with a 100-A main breaker. A system bonding jumper is installed at each of the panelboards. Determine the size of the system bonding jumpers at each panelboard enclosure.

200-A panelboards:

Size of largest ungrounded conductor supplying the two 200-A panelboards:

3/0 AWG copper

System bonding jumper [from Table 250.102(C)(1)]:

3/0 AWG copper ungrounded conductors → 4 AWG copper or 2 AWG aluminum system bonding jumper

100-A panelboard:

Size of largest ungrounded conductor supplying the 100-A panelboard:

3 AWG copper

System bonding jumper [from Table 250.102(C)(1)]:

3 AWG copper ungrounded conductors → 8 AWG copper or 6 AWG aluminum system bonding jumper

Application Example 3

System Bonding Jumper at the Transformer

The same electrical equipment arrangement as in the previous example applies. In this case, however, the system bonding jumper is installed at the transformer and connects the transformer neutral terminal (XO) to individual supply-side bonding jumpers that are installed between the panelboard EGC terminals and a terminal bus attached to the transformer enclosure. Determine the size of the system bonding jumper.

Size the system bonding jumper from the terminal bus in the transformer to the transformer neutral terminal (XO). There are two secondary feeder circuits with 3/0 AWG ungrounded conductors and one with 3 AWG ungrounded conductors. Find the cumulative circular mil area of all ungrounded conductors of a phase.

From Chapter 9, Table 8:

$$3/0 \text{ AWG} = 167,800 \text{ circular mils} \times 2 \text{ (number of sets of secondary conductors)} = 335,600 \text{ circular mils}$$

$$3 \text{ AWG} = 52,620 \text{ circular mils}$$

$$\text{total} = 388,220 \text{ circular mils}$$

From Table 250.102(C):

388,220 circular mils copper ungrounded conductors → 2 AWG copper or 1/0 AWG aluminum system bonding jumper

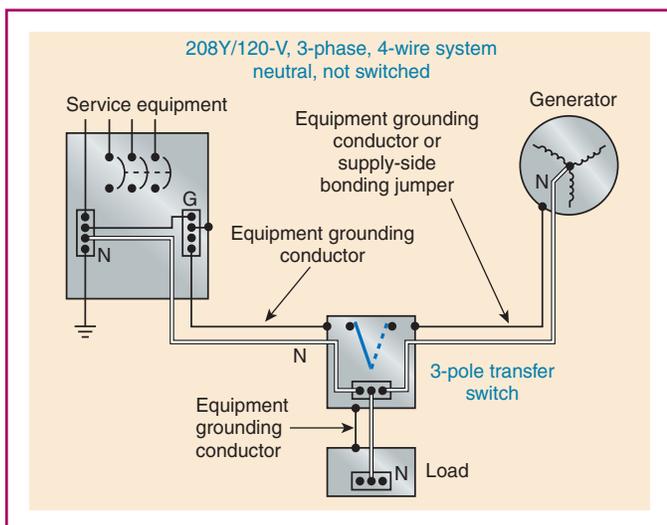

EXHIBIT 250.13 A 208Y/120-volt, 3-phase, 4-wire system that has a direct electrical connection of the grounded circuit conductor (neutral) to the generator and is therefore not considered a separately derived system.

electrical connection between the normal grounded system conductor (neutral) and the generator neutral through the neutral bus in the transfer switch, thereby grounding the generator neutral. Because the grounded circuit conductor is connected to the normal system grounded conductor, it is not a separately derived system and there are no requirements for grounding the neutral at the generator (see Informational Note No. 1 to 250.30).

In Exhibit 250.14, the grounded conductor (neutral) is connected to the switching contacts of a 4-pole transfer switch. The generator system does not have a direct electrical connection to the other supply system grounded conductor (neutral), other than the bonding and equipment grounding conductors. Therefore, the system supplied by the generator is considered separately derived.

(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to normally non-current-carrying metal parts of equipment, be connected to equipment grounding

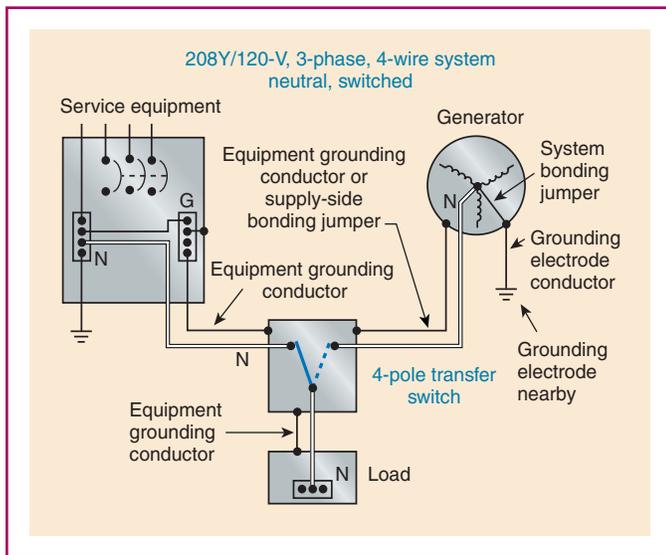

EXHIBIT 250.14 A 208Y/120-volt, 3-phase, 4-wire system that does not have a direct electrical connection of the grounded circuit conductor (neutral) to the generator and is therefore considered a separately derived system.

conductors, or be reconnected to ground on the load side of the system bonding jumper.

Informational Note: See 250.32 for connections at separate buildings or structures and 250.142 for use of the grounded circuit conductor for grounding equipment.

Exception: Impedance grounded neutral system grounding connections shall be made as specified in 250.36 or 250.187, as applicable.

Common Misconception

Does installing a system bonding jumper at both the source of a separately derived system and the first system disconnecting means provide a better connection to ground for a separately derived system?

Installing a system bonding jumper at both the source and the first disconnecting means can result in establishing an unintended parallel path for current that would otherwise utilize the grounded conductor. Exposed normally non-current-carrying metal components are often included as part of this parallel path and can present an unintentional safety hazard. This type of installation is prohibited with the exception of a building or structure supplied by an outdoor separately derived system, provided that such a connection does not create a parallel path for the grounded conductor.

(1) System Bonding Jumper. An unspliced system bonding jumper shall comply with 250.28(A) through (D). This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices, in accordance with 250.30(A)(1)(a) or (b). The system bonding jumper shall remain within the enclosure where

it originates. If the source is located outside the building or structure supplied, a system bonding jumper shall be installed at the grounding electrode connection in compliance with 250.30(C).

Exception No. 1: For systems installed in accordance with 450.6, a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted.

Exception No. 2: If a building or structure is supplied by a feeder from an outdoor separately derived system, a system bonding jumper at both the source and the first disconnecting means shall be permitted if doing so does not establish a parallel path for the grounded conductor. If a grounded conductor is used in this manner, it shall not be smaller than the size specified for the system bonding jumper but shall not be required to be larger than the ungrounded conductor(s). For the purposes of this exception, connection through the earth shall not be considered as providing a parallel path.

Exception No. 3: The size of the system bonding jumper for a system that supplies a Class 1, Class 2, or Class 3 circuit, and is derived from a transformer rated not more than 1000 volt-amperes, shall not be smaller than the derived ungrounded conductors and shall not be smaller than 14 AWG copper or 12 AWG aluminum.

(a) *Installed at the Source.* The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper and the normally non-current-carrying metal enclosure.

(b) *Installed at the First Disconnecting Means.* The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper, the disconnecting means enclosure, and the equipment grounding conductor(s).

Separately derived systems are required to have a system bonding jumper to connect the grounded circuit conductor (neutral) to the supply side bonding jumper or equipment grounding conductor, or both.

The system bonding jumper can be installed in several ways. For example, if a multi-barrel lug is connected to the XO terminal of a transformer, the system bonding jumper, grounding electrode conductor, grounded conductor, and supply-side jumper can be connected at that connector. If a multi-barrel lug is connected to the transformer or generator enclosure, a common practice is to connect the system bonding jumper, the grounding electrode conductor, and the bonding jumper or conductor to that connector. The grounded conductor should always connect directly to the XO terminal.

See also

[250.28\(D\)](#) and its commentary feature for more information on sizing the system bonding jumper

(2) Supply-Side Bonding Jumper. If the source of a separately derived system and the first disconnecting means are located in separate enclosures, a supply-side bonding jumper shall be installed with the circuit conductors from the source enclosure to the first disconnecting means. A supply-side bonding jumper shall not be required to be larger than the derived ungrounded

conductors. The supply-side bonding jumper shall be permitted to be of nonflexible metal raceway type or of the wire or bus type as follows:

(a) A supply-side bonding jumper of the wire type shall comply with 250.102(C), based on the size of the derived ungrounded conductors.

(b) A supply-side bonding jumper of the bus type shall have a cross-sectional area not smaller than a supply-side bonding jumper of the wire type as determined in 250.102(C).

Exception: A supply-side bonding jumper shall not be required between enclosures for installations made in compliance with 250.30(A)(1), Exception No. 2.

The supply-side bonding jumper installed between the separately derived system enclosure and the enclosure of the first system disconnecting means provides the path for the circuit ground-fault current, whether the system bonding jumper is installed at the source enclosure or at the disconnecting means enclosure. The supply-side bonding jumper can be a bare, covered, or insulated wire that is sized per 250.102(C), or it can be rigid metal conduit, intermediate metal conduit, or electrical metallic tubing installed between the two enclosures.

Application Example

The source of a separately derived system is a 75-kVA dry-type transformer. Liquidtight flexible metal conduit is used as the wiring method between the transformer and the 200-A fusible safety switch that is the first system disconnecting means. The system bonding jumper is installed in the safety switch enclosure. The ungrounded conductors are 3/0 AWG copper. The wiring method necessitates the installation of a wire-type supply-side bonding jumper. What is the minimum size for this bonding jumper?

Solution

The requirement covering the minimum size for the supply-side bonding jumper is 250.102(C). This section refers to Table 250.102(C)(1) for sizing supply-side bonding jumpers where the ungrounded supply conductors are not greater than 1100 kcmil copper or 1750 kcmil aluminum. From Table 250.102(C)(1), 3/0 AWG ungrounded conductors = 4 AWG copper or 2 AWG aluminum supply-side bonding jumper. If the length of the bonding jumper does not exceed 6 ft, 250.102(E)(2) permits it to be installed outside of, and routed with, the raceway.

(3) Grounded Conductor. If a grounded conductor is installed and the system bonding jumper connection is not located at the source, 250.30(A)(3)(a) through (A)(3)(d) shall apply.

(a) *Sizing for a Single Raceway.* The grounded conductor shall not be smaller than specified in Table 250.102(C)(1).

(b) *Parallel Conductors in Two or More Raceways.* If the ungrounded conductors are installed in parallel in two or more raceways, the grounded conductor shall also be installed in parallel. The size of the grounded conductor in each raceway shall be based on the total circular mil area of the parallel derived ungrounded

conductors in the raceway as indicated in 250.30(A)(3)(a), but not smaller than 1/0 AWG.

Informational Note: See 310.10(H) for grounded conductors connected in parallel.

(c) *Delta-Connected System.* The grounded conductor of a 3-phase, 3-wire delta system shall have an ampacity not less than that of the ungrounded conductors.

(d) *Impedance Grounded System.* The grounded conductor of an impedance grounded neutral system shall be installed in accordance with 250.36 or 250.187, as applicable.

Grounded and neutral conductors that carry current as part of normal circuit operation are required to be sized in accordance with 220.61. Grounded conductors that are intended to carry fault current must also meet the sizing requirements of 250.102(C).

(4) Grounding Electrode. The building or structure grounding electrode system shall be used as the grounding electrode for the separately derived system. If located outdoors, the grounding electrode shall be in accordance with 250.30(C).

Exception: If a separately derived system originates in equipment that is listed and identified as suitable for use as service equipment, the grounding electrode used for the service or feeder equipment shall be permitted to be used as the grounding electrode for the separately derived system.

Informational Note No. 1: See 250.104(D) for bonding requirements for interior metal water piping in the area served by separately derived systems.

Informational Note No. 2: See 250.50 and 250.58 for requirements for bonding all electrodes together if located at the same building or structure.

As described in 250.52(A)(1) through (A)(7), all electrodes that are present are required to be bonded together to form the grounding electrode system for the building or structure. Separately derived systems are required to utilize the entire building or structure grounding electrode system as the grounding electrode.

(5) Grounding Electrode Conductor, Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with 250.66 for the derived ungrounded conductors. It shall be used to connect the grounded conductor of the derived system to the grounding electrode in accordance with 250.30(A)(4), or as permitted in 250.68(C)(1) and (2). This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected.

Exception No. 1: If the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus if the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: If the source of a separately derived system is located within equipment listed and identified as suitable for

use as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, if the grounding electrode conductor is of sufficient size for the separately derived system. If the equipment grounding bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

Exception No. 3: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1), Exception No. 3, and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

The location of the grounding electrode conductor (GEC) connection to the grounded conductor must be at the point at which the system bonding jumper is connected to the grounded conductor. This allows the normal neutral current to be carried only on the system grounded conductor and not be imposed on parallel paths. Exhibits 250.15 and 250.16 illustrate two acceptable locations for connecting the GEC to the grounded conductor of a separately derived system. These exhibits depict typical wiring arrangements for dry-type transformers supplied from a 480-volt, 3-phase feeder to derive a 208Y/120-volt or 480Y/277-volt secondary.

In Exhibit 250.15, the GEC connection is made at the source of the separately derived system (in the transformer on a terminal bar as

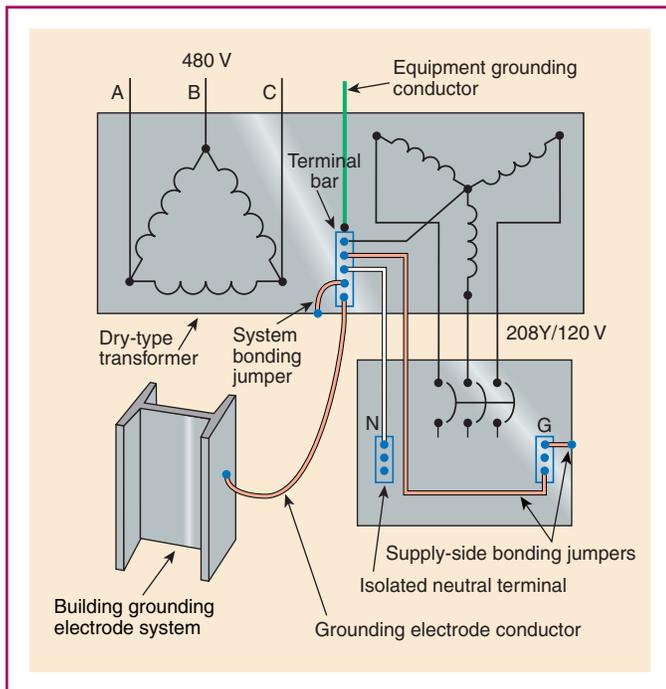

EXHIBIT 250.15 A grounding arrangement for a separately derived system in which the grounding electrode conductor connection is made at the source of the separately derived system (transformer).

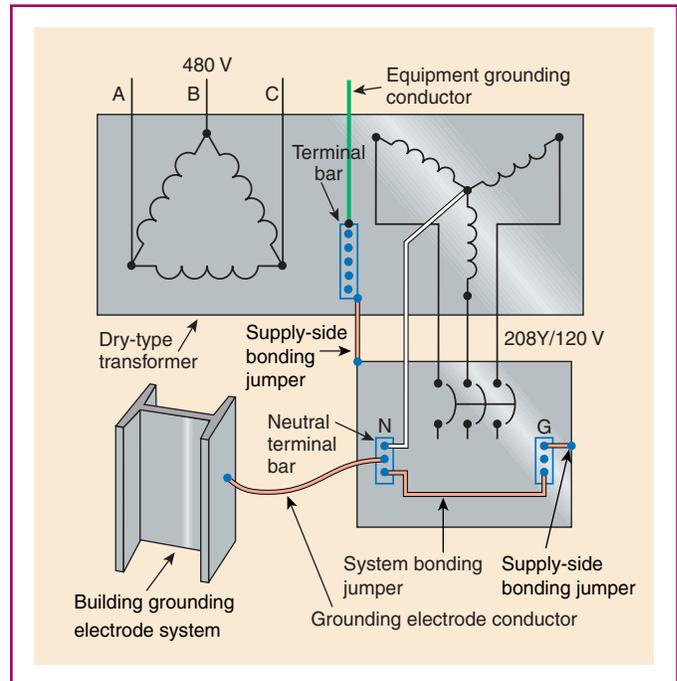

EXHIBIT 250.16 A grounding arrangement for a separately derived system in which the grounding electrode conductor connection is made at the first system disconnecting means.

required by 450.10 where the system bonding jumper is also installed). In Exhibit 250.16, the GEC connection is made at the first disconnecting means where the system bonding jumper is installed. With the GEC, the bonding jumper and the bonding of the grounded circuit conductor (neutral) connected as shown, line-to-ground fault currents are able to return to the supply source through a short, low-impedance path. A path of lower impedance is provided that facilitates the operation of overcurrent devices, in accordance with 250.4(A)(5).

(6) Grounding Electrode Conductor, Multiple Separately Derived Systems. A common grounding electrode conductor for multiple separately derived systems shall be permitted. If installed, the common grounding electrode conductor shall be used to connect the grounded conductor of the separately derived systems to the grounding electrode as specified in 250.30(A)(4). A grounding electrode conductor tap shall then be installed from each separately derived system to the common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected.

A common grounding electrode conductor (GEC) serving several separately derived systems is an alternative to installing individual GECs from each separately derived system to the grounding electrode system. In such an arrangement, a tapped GEC is installed from the common GEC to the point of connection to the individual separately derived system grounding conductor. This tap is sized from Table 250.66 based on the size of the ungrounded conductors for that individual separately derived system.

EXHIBIT 250.17 Listed connectors used to connect the common grounding electrode conductor and individual taps to a centrally located copper busbar with a minimum dimension of ¼ inch thick by 2 inches wide.

The minimum size for this conductor is 3/0 AWG copper or 250 kcmil aluminum so that the GEC always is of sufficient size to accommodate the multiple separately derived systems it serves. The sizing requirement for the common GEC is specified in 250.30(A)(6)(a), and the sizing requirement for the individual taps to the common GEC is specified in 250.30(A)(6)(b).

The methods of connecting the individual tap conductor(s) to the common GEC are specified in 250.30(A)(6)(c). The permitted methods include the use of busbar as a point of connection between the taps and the common GEC. The connections to the busbar must be made using a listed means. Exhibit 250.17 shows a copper busbar used as a connection point for the individual taps from multiple separately derived systems to be connected to the common grounding electrode

Exception No. 1: If the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor tap to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1), Exception No. 3, and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

(a) **Common Grounding Electrode Conductor.** The common grounding electrode conductor shall be permitted to be one of the following:

- (1) A conductor of the wire type not smaller than 3/0 AWG copper or 250 kcmil aluminum
- (2) A metal water pipe that complies with 250.68(C)(1)
- (3) The metal structural frame of the building or structure that complies with 250.68(C)(2) or is connected to the

grounding electrode system by a conductor not smaller than 3/0 AWG copper or 250 kcmil aluminum

(b) **Tap Conductor Size.** Each tap conductor shall be sized in accordance with 250.66 based on the derived ungrounded conductors of the separately derived system it serves.

Exception: If the source of a separately derived system is located within equipment listed and identified as suitable for use as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, if the grounding electrode conductor is of sufficient size for the separately derived system. If the equipment grounding bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

(c) **Connections.** All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:

- (1) A connector listed as grounding and bonding equipment.
- (2) Listed connections to aluminum or copper busbars not smaller than 6 mm thick × 50 mm wide (¼ in. thick × 2 in. wide) and of sufficient length to accommodate the number of terminations necessary for the installation. If aluminum busbars are used, the installation shall also comply with 250.64(A).
- (3) The exothermic welding process.

Tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.

(7) Installation. The installation of all grounding electrode conductors shall comply with 250.64(A), (B), (C), and (E).

(8) Bonding. Structural steel and metal piping shall be connected to the grounded conductor of a separately derived system in accordance with 250.104(D).

(B) Ungrounded Systems. The equipment of an ungrounded separately derived system shall be grounded and bonded as specified in 250.30(B)(1) through (B)(3).

(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with 250.66 for the largest derived ungrounded conductor(s) or set of derived ungrounded conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 250.30(A)(5) or (6), as applicable. This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means. If the source is located outside the building or structure supplied, a grounding electrode connection shall be made in compliance with 250.30(C).

For ungrounded separately derived systems, a grounding electrode conductor (GEC) is required to be connected to the metal enclosure of the system disconnecting means. The GEC is sized from [Table 250.66](#) based on the largest ungrounded supply conductor. This connection establishes a reference to ground for all exposed non-current-carrying metal equipment supplied from the ungrounded system. The EGCs of circuits supplied from the ungrounded system are connected to ground via this GEC connection.

(2) Grounding Electrode. Except as permitted by [250.34](#) for portable and vehicle-mounted generators, the grounding electrode shall comply with [250.30\(A\)\(4\)](#).

(3) Bonding Path and Conductor. A supply-side bonding jumper shall be installed from the source of a separately derived system to the first disconnecting means in compliance with [250.30\(A\)\(2\)](#).

(C) Outdoor Source. If the source of the separately derived system is located outside the building or structure supplied, a grounding electrode connection shall be made at the source location to one or more grounding electrodes in compliance with [250.50](#). In addition, the installation shall comply with [250.30\(A\)](#) for grounded systems or with [250.30\(B\)](#) for ungrounded systems.

Exception: The grounding electrode conductor connection for impedance grounded neutral systems shall comply with [250.36](#) or [250.187](#), as applicable.

This exception is similar in function to the requirement of [250.24\(A\)\(2\)](#) in that it allows an outdoor grounding connection at the source of a separately derived system. This connection provides a first line of defense against the effects of overvoltages due to lightning, transients or accidental contact between conductors of systems operating at different voltages.

250.32 Buildings or Structures Supplied by a Feeder(s) or Branch Circuit(s).

(A) Grounding Electrode. Building(s) or structure(s) supplied by feeder(s) or branch circuit(s) shall have a grounding electrode or grounding electrode system installed in accordance with [Part III](#) of [Article 250](#). The grounding electrode conductor(s) shall be connected in accordance with [250.32\(B\)](#) or (C). Where there is no existing grounding electrode, the grounding electrode(s) required in [250.50](#) shall be installed.

The equipment grounding bus must be bonded to the grounding electrode system as is shown for Buildings 2 and 3 in [Exhibit 250.18](#). Building 1 is supplied by a service and is grounded in accordance with [250.24\(A\)](#) through (D), and the disconnecting means enclosure, building steel, and interior metal water piping are also required to be bonded to the grounding electrode system. All exposed non-current-carrying metal parts of electrical equipment are required to be grounded through EGC connections to the equipment grounding bus at the building disconnecting means. The grounded conductor of the feeder supplying Building 2 is permitted to be re-grounded per [250.32\(B\)\(1\)](#), [Exception No. 1](#). An EGC is run with the feeder to Building 3 as specified in the general requirement of [250.32\(B\)](#).

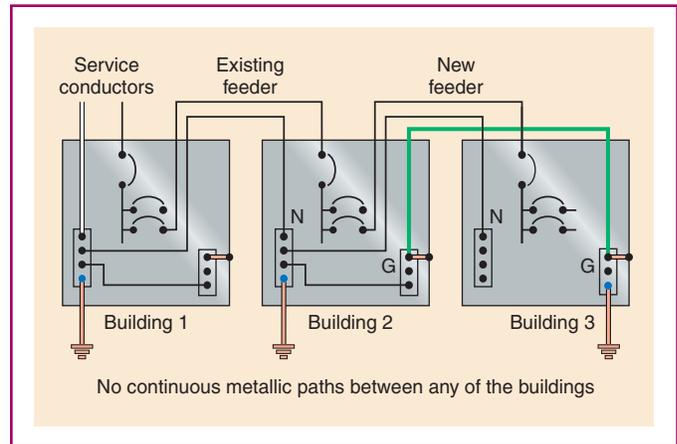

EXHIBIT 250.18 Example of grounding electrode systems required at feeder-supplied Building 2 and Building 3.

Exception: A grounding electrode shall not be required where only a single branch circuit, including a multiwire branch circuit, supplies the building or structure and the branch circuit includes an equipment grounding conductor for grounding the normally non-current-carrying metal parts of equipment.

(B) Grounded Systems.

(1) Supplied by a Feeder or Branch Circuit. An equipment grounding conductor, as described in [250.118](#), shall be run with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with [250.122](#). Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).

Exception No. 1: For installations made in compliance with previous editions of this Code that permitted such connection, the grounded conductor run with the supply to the building or structure shall be permitted to serve as the ground-fault return path if all of the following requirements continue to be met:

- (1) An equipment grounding conductor is not run with the supply to the building or structure.
- (2) There are no continuous metallic paths bonded to the grounding system in each building or structure involved.
- (3) Ground-fault protection of equipment has not been installed on the supply side of the feeder(s).

If the grounded conductor is used for grounding in accordance with the provision of this exception, the size of the grounded conductor shall not be smaller than the larger of either of the following:

- (1) That required by [220.61](#)
- (2) That required by [250.122](#)

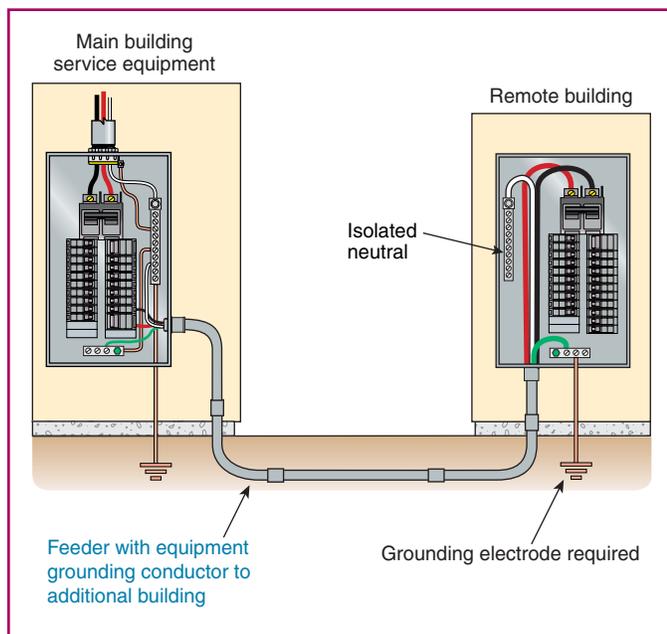

EXHIBIT 250.19 An installation in which a connection between the grounded conductor (neutral) and equipment grounding terminal bar is not permitted. A connection from the equipment grounding terminal bus to the grounding electrode is required.

Exception No. 2: If system bonding jumpers are installed in accordance with 250.30(A)(1), Exception No. 2, the feeder grounded circuit conductor at the building or structure served shall be connected to the equipment grounding conductors, grounding electrode conductor, and the enclosure for the first disconnecting means

Using the grounded conductor to ground equipment, in lieu of installing a separate EGC, creates parallel paths for normal neutral current along metal raceways, metal piping, metal cable sheaths or shields, and other metal structures such as ductwork. Installing an EGC with the supply circuit conductors helps ensure that normal circuit current is not imposed on continuous metal paths other than the insulated grounded or neutral conductor. At a building or structure supplied by a feeder or branch circuit, the EGC is connected to the grounding electrode system [unless the installation complies with 250.32(A), Exception] in the equipment supplied by the feeder or branch circuit. Where installed, the grounded or neutral conductor is electrically isolated from the EGC and any grounding electrodes at the building or structure supplied by the feeder or branch circuit, which is illustrated in Exhibit 250.19.

Because “re-grounding” the neutral or grounded conductor was permitted in previous editions of the *NEC*, Exception No. 1 to 250.32(B)(1) permits limited applications where the grounded conductor is used for grounding and bonding of equipment and systems, but only for circuits that were installed in compliance with the *NEC* prior to the 2008 edition and where the three conditions specified in the current exception are met.

(2) Supplied by Separately Derived System.

(a) *With Overcurrent Protection.* If overcurrent protection is provided where the conductors originate, the installation shall comply with 250.32(B)(1).

(b) *Without Overcurrent Protection.* If overcurrent protection is not provided where the conductors originate, the installation shall comply with 250.30(A). If installed, the supply-side bonding jumper shall be connected to the building or structure disconnecting means and to the grounding electrode(s).

The grounding and bonding requirements for a building supplied by a separately derived system are dependent on the location of the OCPD. For example, if a separately derived system originates in a generator and an OCPD is installed at the generator to protect the feeder, an EGC is required to be installed with the feeder conductors. The separately derived system is grounded as specified in 250.30(C) for outdoor sources. Where the building has a disconnecting means [700.12(B)(6), 701.12(B)(5), and 702.12 amend the general disconnecting means requirement in 225.31 and 225.32], the EGC is connected to the disconnecting means enclosure and to the building’s grounding electrode system. This installation is no different from what is required for feeders originating in another building. Where an OCPD is not located at the source (as is the case with many outdoor transformer installations), the grounding and bonding requirements of 250.30(A) apply and a supply-side bonding jumper is used to complete the ground-fault current path between the source and the building or structure supplied.

(C) Ungrounded Systems.

(1) **Supplied by a Feeder or Branch Circuit.** An equipment grounding conductor, as described in 250.118, shall be installed with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The grounding electrode(s) shall also be connected to the building or structure disconnecting means.

(2) Supplied by a Separate y Derived System.

(a) *With Overcurrent Protection.* If overcurrent protection is provided where the conductors originate, the installation shall comply with (C)(1).

(b) *Without Overcurrent Protection.* If overcurrent protection is not provided where the conductors originate, the installation shall comply with 250.30(B). If installed, the supply-side bonding jumper shall be connected to the building or structure disconnecting means and to the grounding electrode(s).

(D) Disconnecting Means Located in Separate Building or Structure on the Same Premises.

Where one or more disconnecting means supply one or more additional buildings or structures under single management, and where these disconnecting means are located remote from those buildings or structures in accordance with the provisions of 225.32, Exception No. 1 and No. 2, 700.12(B)(6), 701.12(B)(5), or 702.12, all of the following conditions shall be met:

- (1) The connection of the grounded conductor to the grounding electrode, to normally non-current-carrying metal parts of equipment, or to the equipment grounding conductor at a separate building or structure shall not be made.
- (2) An equipment grounding conductor for grounding and bonding any normally non-current-carrying metal parts of

equipment, interior metal piping systems, and building or structural metal frames is run with the circuit conductors to a separate building or structure and connected to existing grounding electrode(s) required in **Part III** of this article, or, where there are no existing electrodes, the grounding electrode(s) required in **Part III** of this article shall be installed where a separate building or structure is supplied by more than one branch circuit.

- (3) The connection between the equipment grounding conductor and the grounding electrode at a separate building or structure shall be made in a junction box, panelboard, or similar enclosure located immediately inside or outside the separate building or structure.

Exceptions to 225.32 and requirements within 700.12(B)(6), 701.12(B)(5), and 702.12 permit the disconnecting means to be located elsewhere from the building or structure being supplied. The requirement to make a connection to a grounding electrode system at these buildings or structures still applies, but no disconnecting means is available in which the connection can be made. Sections 250.32(D)(1) through (D)(3) allow for the required connection to be made in a panelboard, junction box, or similar enclosure that is located either inside or outside of the building or structure being supplied. This enclosure must be located at a point nearest to where the supply conductors enter the building or structure. An EGC must be run with the supply conductors. The grounded conductor (where installed) must not be bonded to the enclosure or equipment grounding bus. The equipment grounding bus must be connected to a new or existing grounding electrode system at the second building. All non-current-carrying metal parts of equipment, building steel, and interior metal piping systems must be connected to the grounding electrode system. Exhibit 250.20 illustrates an installation in which Building 1 houses the disconnecting means for Building 2.

(E) Grounding Electrode Conductor. The size of the grounding electrode conductor to the grounding electrode(s) shall not be smaller than given in 250.66, based on the largest ungrounded supply conductor. The installation shall comply with **Part III** of this article.

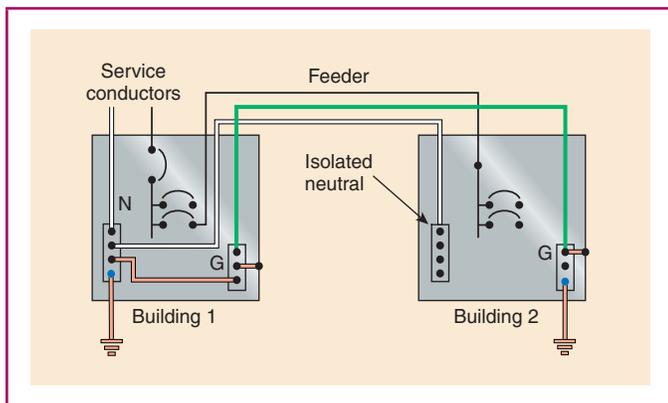

EXHIBIT 250.20 Grounding and bonding for a separate building under single management with the disconnect located remotely from the building.

250.34 Portable and Vehicle-Mounted Generators.

(A) Portable Generators. The frame of a portable generator shall not be required to be connected to a grounding electrode as defined in 250.52 for a system supplied by the generator under the following conditions:

- (1) The generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both, and
- (2) The normally non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are connected to the generator frame.

The frame of a portable generator is not required to be connected to earth (as through a ground rod or water pipe) if the generator has receptacles mounted on the generator panel and the receptacles have equipment grounding terminals bonded to the generator frame. "Portable" describes equipment that is easily carried from one location to another.

(B) Vehicle-Mounted Generators. The frame of a vehicle shall not be required to be connected to a grounding electrode as defined in 250.52 for a system supplied by a generator located on this vehicle under the following conditions:

- (1) The frame of the generator is bonded to the vehicle frame, and
- (2) The generator supplies only equipment located on the vehicle or cord-and-plug-connected equipment through receptacles mounted on the vehicle, or both equipment located on the vehicle and cord-and-plug-connected equipment through receptacles mounted on the vehicle or on the generator, and
- (3) The normally non-current carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are connected to the generator frame.

Vehicle-mounted generators that provide a neutral conductor and are installed as separately derived systems supplying equipment and receptacles on the vehicle are required to have the neutral conductor bonded to the generator frame and to the vehicle frame. The non-current-carrying parts of the equipment must be bonded to the generator frame.

(C) Grounded Conductor Bonding. A system conductor that is required to be grounded by 250.26 shall be connected to the generator frame where the generator is a component of a separately derived system.

Informational Note: For grounding portable generators supplying fixed wiring systems, see 250.30.

Portable and vehicle-mounted generators that are installed as separately derived systems and that provide a neutral conductor (such as 3-phase, 4-wire, wye-connected; single-phase 240/120-volt; or 3-phase, 4-wire, delta-connected) are required to have the neutral conductor bonded to the generator frame.

250.35 Permanently Installed Generators. A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed

generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If the generator is installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a supply-side bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar, or bus of the disconnecting mean(s). It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.

The requirements of 250.35(B) create a return path for ground-fault current for permanently installed generators supplying a system that is not separately derived where the first system OCPD is not installed at the generator. The conductor used to conduct ground-fault current between the first system disconnecting means and the generator is a supply-side bonding jumper, which is permitted to be a nonflexible metal raceway or a wire.

See also

250.102(C) for sizing of wire-type supply-side bonding jumpers

250.36 High-Impedance Grounded Neutral Systems. High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if all the following conditions are met:

- (1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.
- (2) Ground detectors are installed on the system.
- (3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

Exhibit 250.21 shows the location of the grounding impedance device (resistor used in this example) in a high-impedance grounded neutral

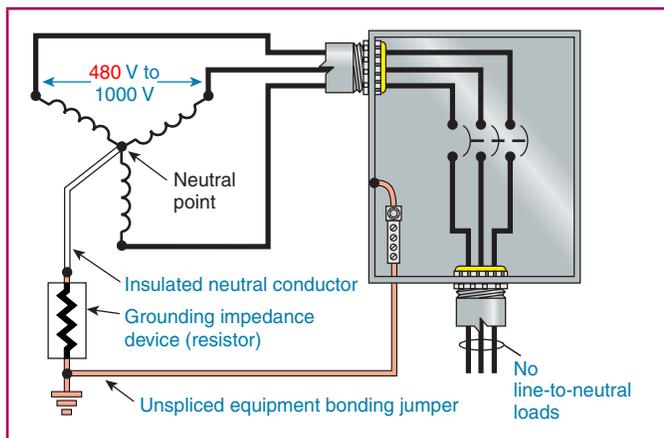

EXHIBIT 250.21 Diagram of a high-impedance grounded neutral system.

system, which limits the amount of ground-fault current in the neutral conductor when a line-to-ground fault occurs. The grounding impedance is selected to limit fault current to a value that is slightly greater than or equal to the capacitive charging current. This system is used where continuity of power is required. Therefore, a ground fault results in an alarm condition rather than in the tripping of a circuit breaker. This alarm allows for the safe and orderly shutdown of a process for which a non-orderly shutdown could introduce additional or increased hazards.

See also

250.187 for requirements for impedance grounded neutral systems rated over 1000 volts

(A) Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Conductor Insulation and Ampacity. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but in no case shall the grounded system conductor be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

Informational Note: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-2007, *Recommended Practice for Grounding of Industrial and Commercial Power Systems*.

(D) Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) Equipment Bonding Jumper. The equipment bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Connection Location. For services or separately derived systems, the grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or the first system disconnecting means of a separately derived system.

(G) Equipment Bonding Jumper Size. The equipment bonding jumper shall be sized in accordance with (1) or (2) as follows:

- (1) If the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.
- (2) If the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Part III. Grounding Electrode System and Grounding Electrode Conductor

250.50 Grounding Electrode System. All grounding electrodes as described in 250.52(A)(1) through (A)(7) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and used.

The formation of a system of electrodes is required where multiple grounding electrodes are at the building being served. Exhibit 250.22 illustrates a grounding electrode system consisting of multiple electrodes, rather than reliance on a single grounding electrode. Metal in-ground support structures, metal water pipe, and concrete footings or foundations are required to be integrated into the grounding electrode system if they qualify under the conditions specified in 250.52(A). The NEC does not specify that metal water pipe, an in-ground structural metal frame, or concrete encased-type electrodes have to be installed only that where

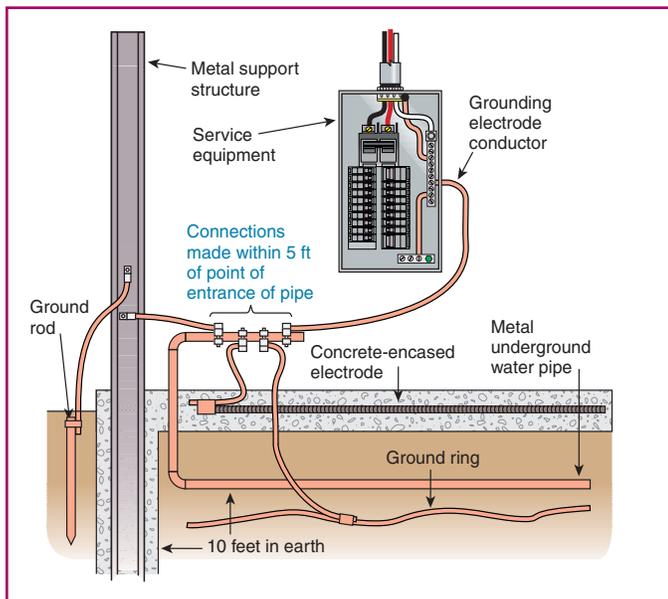

EXHIBIT 250.22 A grounding electrode system that uses the metal frame of a building, a ground ring, a concrete-encased electrode, a metal underground water pipe, and a ground rod.

they have been installed as part of the building construction they are to be used as components of the grounding electrode system.

Exception: Concrete-encased electrodes of existing buildings or structures shall not be required to be part of the grounding electrode system where the steel reinforcing bars or rods are not accessible for use without disturbing the concrete.

Because the installation of the footings and foundation is one of the first elements of a construction project, one that in most cases has long been completed by the time the electric service is installed, this rule necessitates an awareness and coordinated effort on the part of designers and the construction trades to make sure that the concrete-encased electrode is incorporated into the grounding electrode system.

250.52 Grounding Electrodes.

(A) Electrodes Permitted for Grounding.

(1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductor(s) or jumper(s), if installed.

In the early years of the NEC, concerns over the effect of electric current on metal water piping created some uncertainty as to whether metal water piping systems should be used as grounding electrodes. To address those concerns, the electrical industry and the waterworks industry formed a committee to evaluate the use of metal underground water piping systems as grounding electrodes. Based on its findings, the committee issued an authoritative report on the subject. The International Association of Electrical Inspectors published the report, *Interim Report of the American Research Committee on Grounding*, in January 1944. This report found that the effects of alternating current on potable water corrosion were negligible. It also serves as part of the basis for the continuation of metal water pipes as part of the grounding electrode system. The National Institute of Standards and Technology (NIST) has also monitored the electrolysis of metal systems as it relates to current at grounding electrodes of dc systems causing displacement of metal. Their results have shown that problems are minimal.

(2) Metal In-ground Support Structure(s). One or more metal in-ground support structure(s) in direct contact with the earth vertically for 3.0 m (10 ft) or more, with or without concrete encasement. If multiple metal in-ground support structures are present at a building or a structure, it shall be permissible to bond only one into the grounding electrode system.

Informational Note: Metal in-ground support structures include, but are not limited to, pilings, casings, and other structural metal.

Metal in-ground support structure electrodes extend the metal building frame into the ground. Connection to more than one in-ground structural member is not necessary. Metal frames of buildings that are secured to hold down bolts connected to a concrete-encased electrode are permitted by 250.68(C)(2) to serve as the grounding electrode conductor.

(3) Concrete-Encased Electrode. A concrete-encased electrode shall consist of at least 6.0 m (20 ft) of either (1) or (2):

- (1) One or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, installed in one continuous 6.0 m (20 ft) length, or if in multiple pieces connected together by the usual steel tie wires, exothermic welding, welding, or other effective means to create a 6.0 m (20 ft) or greater length; or
- (2) Bare copper conductor not smaller than 4 AWG

Metallic components shall be encased by at least 50 mm (2 in.) of concrete and shall be located horizontally within that portion of a concrete foundation or footing that is in direct contact with the earth or within vertical foundations or structural components or members that are in direct contact with the earth. If multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Informational Note: Concrete installed with insulation, vapor barriers, films or similar items separating the concrete from the earth is not considered to be in “direct contact” with the earth.

To qualify as a grounding electrode, the horizontal or vertical installation of the steel reinforcing rod or the 4 AWG bare copper conductor within the concrete encasement is required to be in contact with the earth for one continuous 20-foot length. Shorter lengths of reinforcing rod can be connected together to form an electrode of at least 20 feet using the connection methods identified in this requirement. Some buildings or structures may have discontinuous segments of a footing or foundation that individually qualify as grounding electrodes per this section and once one has been bonded to the grounding electrode system, the remaining ones are exempt from any bonding or grounding requirements. Exhibit 250.23 shows an example of a concrete-encased electrode embedded horizontally. As indicated in the informational note, direct contact with the earth means that no medium is between the concrete and the earth that impedes the grounding connection or insulates the concrete from being in direct contact with the earth.

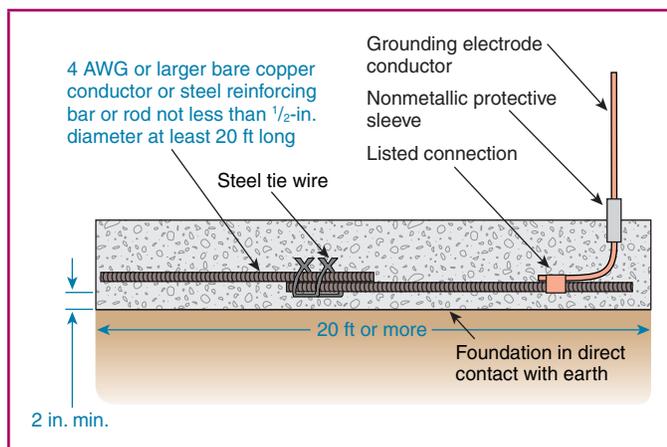

EXHIBIT 250.23 An example of a concrete-encased electrode that is required to be incorporated into the grounding electrode system.

(4) Ground Ring. A ground ring encircling the building or structure, in direct contact with the earth, consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG.

(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2.44 m (8 ft) in length and shall consist of the following materials.

(a) Grounding electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Rod-type grounding electrodes of stainless steel and copper or zinc coated steel shall be at least 15.87 mm (⅝ in.) in diameter, unless listed.

(6) Other Listed Electrodes. Other listed grounding electrodes shall be permitted.

(7) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m² (2 ft²) of surface to exterior soil. Electrodes of bare or electrically conductive coated iron or steel plates shall be at least 6.4 mm (¼ in.) in thickness. Solid, uncoated electrodes of nonferrous metal shall be at least 1.5 mm (0.06 in.) in thickness.

(8) Other Local Metal Underground Systems or Structures. Other local metal underground systems or structures such as piping systems, underground tanks, and underground metal well casings that are not bonded to a metal water pipe.

(B) Not Permitted for Use as Grounding Electrodes. The following systems and materials shall not be used as grounding electrodes:

- (1) Metal underground gas piping systems
- (2) Aluminum
- (3) The structures and structural reinforcing steel described in 680.26(B)(1) and (B)(2)

Informational Note: See 250.104(B) for bonding requirements of gas piping.

250.53 Grounding Electrode System Installation.

(A) Rod, Pipe, and Plate Electrodes. Rod, pipe, and plate electrodes shall meet the requirements of 250.53(A)(1) through (A)(3).

(1) Below Permanent Moisture Level. If practicable, rod, pipe, and plate electrodes shall be embedded below permanent moisture level. Rod, pipe, and plate electrodes shall be free from nonconductive coatings such as paint or enamel.

(2) Supplemental Electrode Required. A single rod, pipe, or plate electrode shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(8). The supplemental electrode shall be permitted to be bonded to one of the following:

- (1) Rod, pipe, or plate electrode
- (2) Grounding electrode conductor

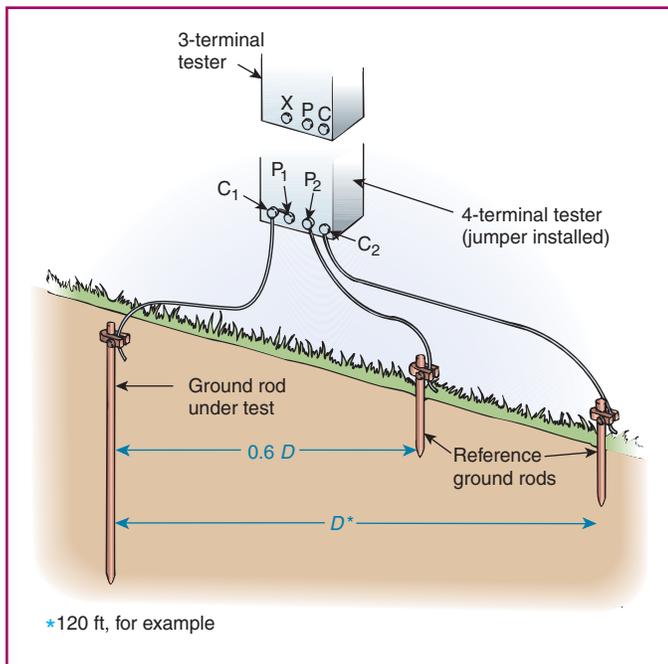

EXHIBIT 250.24 The resistance to ground of a ground rod being measured using a fall of potential ground tester. The clamp-on tester is another method of determining the earth resistance of a grounding electrode.

- (3) Grounded service-entrance conductor
- (4) Nonflexible grounded service raceway
- (5) Any grounded service enclosure

Exception: If a single rod, pipe, or plate grounding electrode has a resistance to earth of 25 ohms or less, the supplemental electrode shall not be required.

There are several methods to measure the resistance to ground of a rod, pipe, or plate electrode. Exhibit 250.24 illustrates one method of determining the ground resistance of a rod-type electrode in which a ground tester is used to measure the “fall of potential” between the rod being tested and the reference rod (stake) connected to the “P1” or “P2” terminal of the tester. The clamp-on ground resistance tester is another method of testing the earth resistance of a grounding electrode. It does not involve the use of reference electrodes to perform the earth resistance test.

(3) Supplemental Electrode. If multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.

Informational Note: The paralleling efficiency of rods is increased by spacing them twice the length of the longest rod.

The spacing requirement in 250.53(A)(3) for multiple auxiliary rod, pipe, or plate electrodes is illustrated in Exhibit 250.25. The direct-buried clamps shown are required to be listed for underground installation per 250.70.

(B) Electrode Spacing. Where more than one of the electrodes of the type specified in 250.52(A)(5) or (A)(7) are used, each electrode of one grounding system (including that used for strike

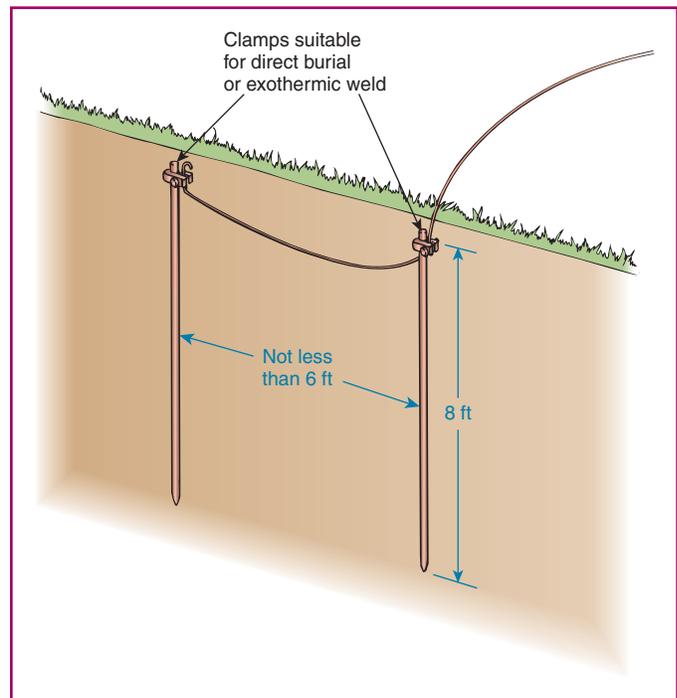

EXHIBIT 250.25 The 6-foot spacing required between electrodes.

termination devices) shall not be less than 1.83 m (6 ft) from any other electrode of another grounding system. Two or more grounding electrodes that are bonded together shall be considered a single grounding electrode system.

(C) Bonding Jumper. The bonding jumper(s) used to connect the grounding electrodes together to form the grounding electrode system shall be installed in accordance with 250.64(A), (B), and (E), shall be sized in accordance with 250.66, and shall be connected in the manner specified in 250.70.

(D) Metal Underground Water Pipe. If used as a grounding electrode, metal underground water pipe shall meet the requirements of 250.53(D)(1) and (D)(2).

(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.

(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(8). If the supplemental electrode is of the rod, pipe, or plate type, it shall comply with 250.53(A). The supplemental electrode shall be bonded to one of the following:

- (1) Grounding electrode conductor
- (2) Grounded service-entrance conductor
- (3) Nonflexible grounded service raceway
- (4) Any grounded service enclosure
- (5) As provided by 250.32(B)

Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as specified in 250.68(C)(1), Exception.

This requirement clarifies that the supplemental electrode system must be installed as if it were the sole grounding electrode for the system. As specified in the exception to 250.53(A)(2), if a single rod, pipe, or plate electrode has a resistance to earth of 25 ohms or less, it is not necessary to supplement that electrode with one of the types from 250.52(A)(2) through (A)(8). In other words, a single rod, pipe, or plate electrode being used to supplement a metal underground water pipe-type electrode is itself required to be provided with a supplemental electrode unless the condition of 250.53(A)(2), Exception, can be met. One of the permitted methods of bonding a supplemental grounding electrode conductor to the grounding electrode system is to connect it to the grounded service enclosure.

The need for supplemental electrodes for metal water pipe is due to the common practice of using a plastic pipe for replacement when the original metal water pipe fails. Plastic replacement pipe leaves the system without a grounding electrode unless a supplemental electrode is provided.

(E) Supplemental Electrode Bonding Connection Size. Where the supplemental electrode is a rod, pipe, or plate electrode, that portion of the bonding jumper that is the sole connection to the supplemental grounding electrode shall not be required to be larger than 6 AWG copper wire or 4 AWG aluminum wire.

If a metal underground water pipe or the metal in-ground support structure is used as the grounding electrode or as part of the grounding electrode system, Table 250.66 must be used for sizing the grounding electrode conductor

(F) Ground Ring. The ground ring shall be installed not less than 750 mm (30 in.) below the surface of the earth.

(G) Rod and Pipe Electrodes. The electrode shall be installed such that at least 2.44 m (8 ft) of length is in contact with the soil. It shall be driven to a depth of not less than 2.44 m (8 ft) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or, where rock bottom is encountered at an angle up to 45 degrees, the electrode shall be permitted to be buried in a trench that is at least 750 mm (30 in.) deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in 250.10.

Where rock bottom is encountered, the electrodes must be either driven at not more than a 45-degree angle or buried in a 2½-foot-deep trench. Driving the rod at an angle is permitted only if it is not possible to drive the rod vertically to obtain at least 8 feet of earth contact. Burying the ground rod is permitted only if driving the rod vertically or at an angle is not possible. Exhibit 250.26 illustrates these requirements.

Section 250.70 requires ground clamps used on buried electrodes to be listed for direct earth burial. Ground clamps installed above ground must be protected where subject to physical damage per 250.10.

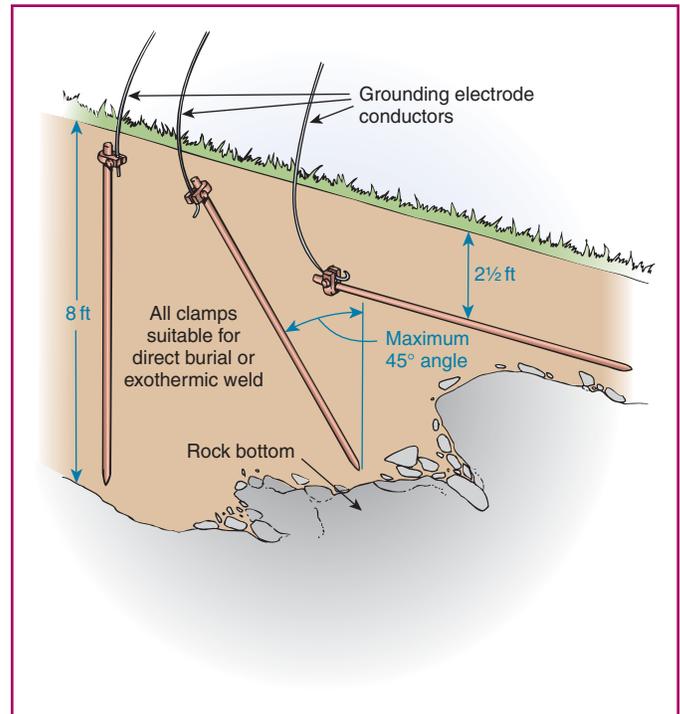

EXHIBIT 250.26 Installation requirements for rod and pipe electrodes.

(H) Plate Electrode. Plate electrodes shall be installed not less than 750 mm (30 in.) below the surface of the earth.

250.54 Auxiliary Grounding Electrodes. One or more grounding electrodes shall be permitted to be connected to the equipment grounding conductors specified in 250.118 and shall not be required to comply with the electrode bonding requirements of 250.50 or 250.53(C) or the resistance requirements of 250.53(A)(2) Exception, but the earth shall not be used as an effective ground-fault current path as specified in 250.4(A)(5) and 250.4(B)(4).

Grounding electrodes, such as ground rods, that are connected to equipment are not permitted to be used in lieu of the EGC, but grounding electrodes may be used to establish a reference to ground in the area of electrically operated equipment. The earth may not be used as the EGC or effective (ground) fault current path. Auxiliary grounding electrodes are not required to be incorporated into the grounding electrode system for the service or other source of electrical supply.

250.58 Common Grounding Electrode. Where an ac system is connected to a grounding electrode in or at a building or structure, the same electrode shall be used to ground conductor enclosures and equipment in or on that building or structure. Where separate services, feeders, or branch circuits supply a building and are required to be connected to a grounding electrode(s), the same grounding electrode(s) shall be used.

Two or more grounding electrodes that are bonded together shall be considered as a single grounding electrode system in this sense.

250.60 Use of Strike Termination Devices. Conductors and driven pipes, rods, or plate electrodes used for grounding strike termination devices shall not be used in lieu of the grounding electrodes required by 250.50 for grounding wiring systems and equipment. This provision shall not prohibit the required bonding together of grounding electrodes of different systems.

Informational Note No. 1: See 250.106 for the bonding requirement of the lightning protection system components to the building or structure grounding electrode system.

Informational Note No. 2: Bonding together of all separate grounding electrodes will limit voltage differences between them and between their associated wiring systems.

250.62 Grounding Electrode Conductor Material. The grounding electrode conductor shall be of copper, aluminum, copper-clad aluminum, or the items as permitted in 250.68(C). The material selected shall be resistant to any corrosive condition existing at the installation or shall be protected against corrosion. Conductors of the wire type shall be solid or stranded, insulated, covered, or bare.

250.64 Grounding Electrode Conductor Installation. Grounding electrode conductors at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at a separately derived system shall be installed as specified in 250.64(A) through (F).

(A) Aluminum or Copper-Clad Aluminum Conductors. Bare aluminum or copper-clad aluminum grounding electrode conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding electrode conductors shall not be terminated within 450 mm (18 in.) of the earth.

(B) Securing and Protection Against Physical Damage. Where exposed, a grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. Grounding electrode conductors shall be permitted to be installed on or through framing members.

See also

250.64(E) and its commentary for additional information on grounding electrode conductors enclosed in metal raceways

(1) Not Exposed to Physical Damage. A 6 AWG or larger copper or aluminum grounding electrode conductor not exposed to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection.

(2) Exposed to Physical Damage. A 6 AWG or larger copper or aluminum grounding electrode conductor exposed to physical damage shall be protected in rigid metal conduit (RMC), intermediate metal conduit (IMC), rigid polyvinyl chloride conduit (PVC), reinforced thermosetting resin conduit Type XW (RTRC-XW), electrical metallic tubing (EMT), or cable armor.

(3) Smaller Than 6 AWG. Grounding electrode conductors smaller than 6 AWG shall be protected in RMC, IMC, PVC, RTRC-XW, EMT, or cable armor.

(4) In Contact with the Earth. Grounding electrode conductors and grounding electrode bonding jumpers in contact with the earth shall not be required to comply with 300.5, but shall be buried or otherwise protected if subject to physical damage.

(C) Continuous. Except as provided in 250.30(A)(5) and (A)(6), 250.30(B)(1), and 250.68(C), grounding electrode conductor(s) shall be installed in one continuous length without a splice or joint. If necessary, splices or connections shall be made as permitted in (1) through (4):

- (1) Splicing of the wire-type grounding electrode conductor shall be permitted only by irreversible compression-type connectors listed as grounding and bonding equipment or by the exothermic welding process.
- (2) Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.
- (3) Bolted, riveted, or welded connections of structural metal frames of buildings or structures.
- (4) Threaded, welded, brazed, soldered or bolted-flange connections of metal water piping.

A building remodeling project or the replacement of existing electrical equipment may necessitate splicing the grounding electrode conductor. Section 250.64(C)(1) contains the permitted means by which the splice can be considered to be a permanent connection that provides the intended grounding electrode conductor continuity.

(D) Building or Structure with Multiple Disconnecting Means in Separate Enclosures. If a building or structure is supplied by a service or feeder with two or more disconnecting means in separate enclosures, the grounding electrode connections shall be made in accordance with 250.64(D)(1), 250.64(D)(2), or 250.64(D)(3).

(1) Common Grounding Electrode Conductor and Taps. A common grounding electrode conductor and grounding electrode conductor taps shall be installed. The common grounding electrode conductor shall be sized in accordance with 250.66, based on the sum of the circular mil area of the largest ungrounded conductor(s) of each set of conductors that supplies the disconnecting means. If the service-entrance conductors connect directly to the overhead service conductors, service drop, underground service conductors, or service lateral, the common grounding electrode conductor shall be sized in accordance with Table 250.66, note 1.

A grounding electrode conductor tap shall extend to the inside of each disconnecting means enclosure. The grounding electrode conductor taps shall be sized in accordance with 250.66 for the largest service-entrance or feeder conductor serving the individual enclosure. The tap conductors shall be connected to the common grounding electrode conductor by one of the following

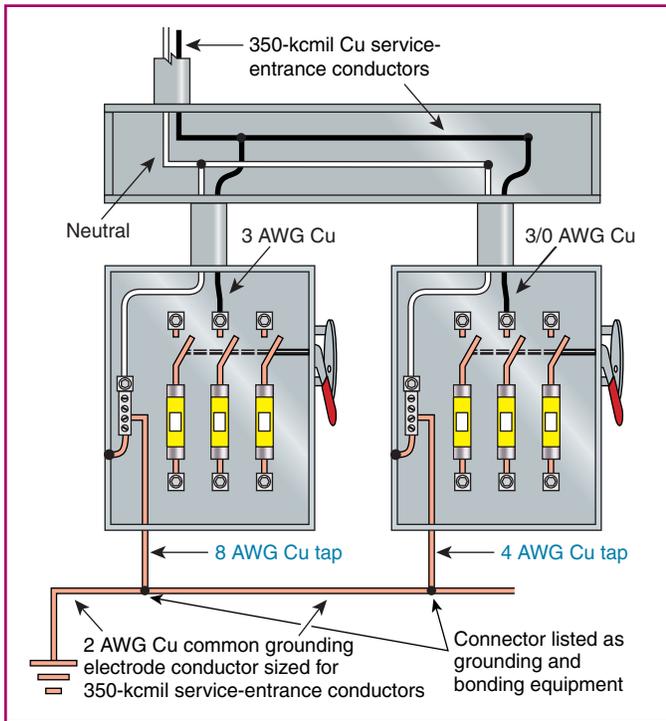

EXHIBIT 250.27 The tap method of connecting the grounding electrode conductor to multiple service disconnecting means enclosures.

methods in such a manner that the common grounding electrode conductor remains without a splice or joint:

- (1) Exothermic welding.
- (2) Connectors listed as grounding and bonding equipment
- (3) Connections to an aluminum or copper busbar not less than 6 mm thick × 50 mm wide (¼ in. thick × 2 in. wide) and of sufficient length to accommodate the number of terminations necessary for the installation. The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process. If aluminum busbars are used, the installation shall comply with 250.64(A).

The common grounding electrode conductor from which the taps are made must be sized from Table 250.66 based on the sum of the circular mil area of the largest ungrounded conductor(s) of each set of conductors that supply the disconnecting means or the sum of the equivalent cross-sectional area for parallel conductors.

As illustrated in Exhibit 250.27, the tap method permitted by this section eliminates the difficulties found in looping grounding electrode conductors from one enclosure to another. The 2 AWG grounding electrode conductor (based on the 350 kcmil ungrounded conductor) shown in Exhibit 250.27 is required to be installed without a splice or joint, except as permitted in 250.64(C), and the 8 AWG and 4 AWG taps are sized from Table 250.66 based on the size of the ungrounded conductor serving the respective service disconnecting means.

(2) Individual Grounding Electrode Conductors. A grounding electrode conductor shall be connected between the grounding electrode system and one or more of the following, as applicable:

- (1) Grounded conductor in each service equipment disconnecting means enclosure
- (2) Equipment grounding conductor installed with the feeder
- (3) Supply-side bonding jumper

Each grounding electrode conductor shall be sized in accordance with 250.66 based on the service-entrance or feeder conductor(s) supplying the individual disconnecting means.

(3) Common Location. A grounding electrode conductor shall be connected in a wireway or other accessible enclosure on the supply side of the disconnecting means to one or more of the following, as applicable:

- (1) Grounded service conductor(s)
- (2) Equipment grounding conductor installed with the feeder
- (3) Supply-side bonding jumper

The connection shall be made with exothermic welding or a connector listed as grounding and bonding equipment. The grounding electrode conductor shall be sized in accordance with 250.66 based on the service-entrance or feeder conductor(s) at the common location where the connection is made.

(E) Raceways and Enclosures for Grounding Electrode Conductors.

These bonding connections are necessary so that the ferrous raceway does not create an inductive choke on the grounding electrode conductor. Exhibit 250.28 shows the required bonding of a ferrous metal

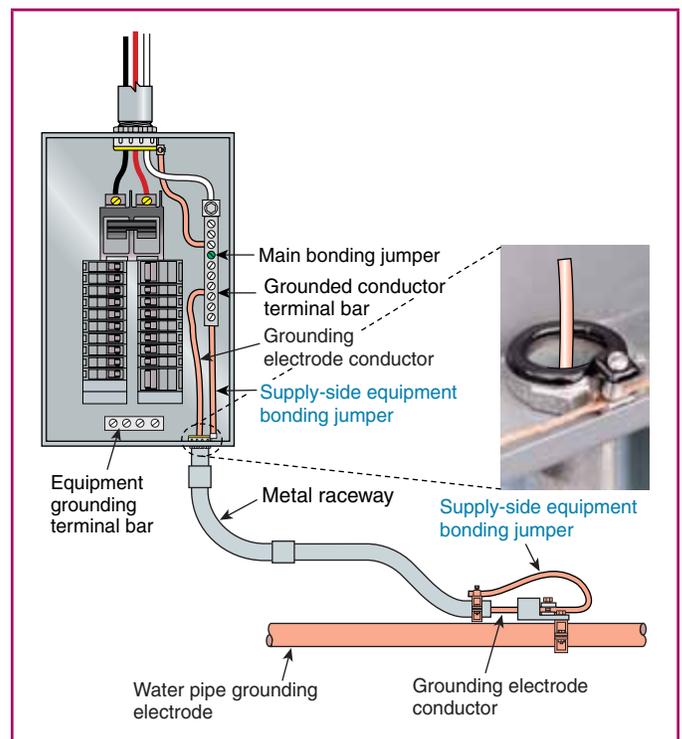

EXHIBIT 250.28 Bonding of a metal raceway that contains a grounding electrode conductor to the conductor at both ends.

raceway to the grounding electrode conductor at both ends of the raceway to ensure that the raceway and conductor are in parallel.

(1) General. Ferrous metal raceways and enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting. Ferrous metal raceways and enclosures shall be bonded at each end of the raceway or enclosure to the grounding electrode or grounding electrode conductor to create an electrically parallel path. Nonferrous metal raceways and enclosures shall not be required to be electrically continuous.

(2) Methods. Bonding shall be in compliance with 250.92(B) and ensured by one of the methods in 250.92(B)(2) through (B)(4).

(3) Size. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the enclosed grounding electrode conductor.

(4) Wiring Methods. If a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

(F) Installation to Electrode(s). Grounding electrode conductor(s) and bonding jumpers interconnecting grounding electrodes shall be installed in accordance with (1), (2), or (3). The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.

- (1) The grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system where the other electrode(s), if any, is connected by bonding jumpers that are installed in accordance with 250.53(C).
- (2) Grounding electrode conductor(s) shall be permitted to be run to one or more grounding electrode(s) individually.
- (3) Bonding jumper(s) from grounding electrode(s) shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm thick \times 50 mm wide ($\frac{1}{4}$ in. thick \times 2 in wide.) and of sufficient length to accommodate the number of terminations necessary for the installation. The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process. The grounding electrode conductor shall be permitted to be run to the busbar. Where aluminum busbars are used, the installation shall comply with 250.64(A).

Exhibit 250.29 illustrates a grounding electrode system. The single grounding electrode conductor (GEC) is permitted to run to any convenient grounding electrode available. The other electrodes are connected together using bonding jumpers sized in accordance with 250.53(C), which references 250.66. A permitted alternative is to run the GEC to a busbar that can be used as a connection point for bonding jumpers from multiple electrodes that form the grounding electrode system. A fully sized GEC, sized in accordance with 250.66 for the largest electrode used,

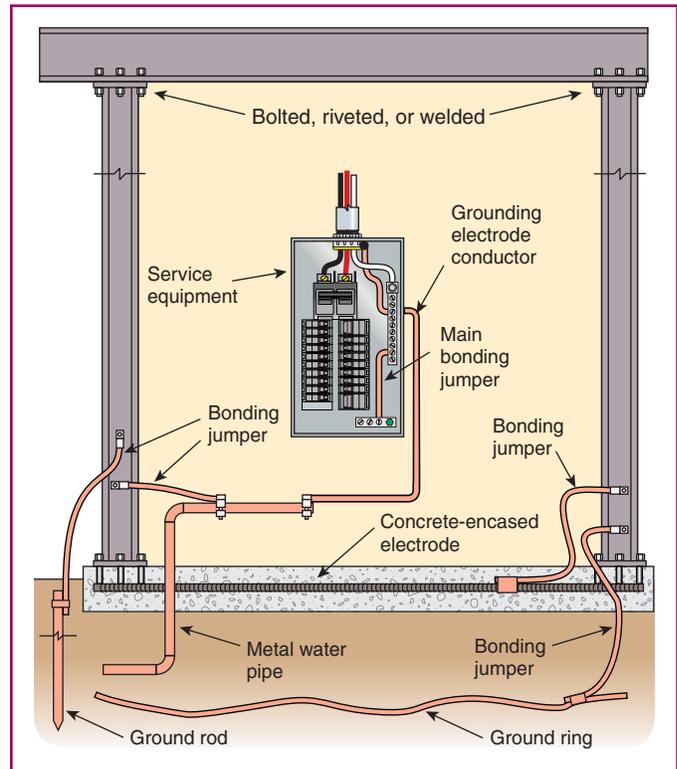

EXHIBIT 250.29 An example of running the grounding electrode conductor to any convenient electrode available as well as bonding all electrodes that are present at a building or structure together to form the required grounding electrode system.

is permitted to be run to the busbar from the point at which it is connected to the grounded or ungrounded system equipment.

250.66 Size of Alternating-Current Grounding Electrode Conductor. The size of the grounding electrode conductor at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at a separately derived system of a grounded or ungrounded ac system shall not be less than given in Table 250.66, except as permitted in 250.66(A) through (C).

(A) Connections to a Rod, Pipe, or Plate Electrode(s). If the grounding electrode conductor or bonding jumper connected to a single or multiple rod, pipe, or plate electrode(s), or any combination thereof, as described in 250.52(A)(5) or (A)(7), does not extend on to other types of electrodes that require a larger size conductor, the grounding electrode conductor shall not be required to be larger than 6 AWG copper wire or 4 AWG aluminum wire.

(B) Connections to Concrete-Encased Electrodes. If the grounding electrode conductor or bonding jumper connected to a single or multiple concrete-encased electrode(s), as described in 250.52(A)(3), does not extend on to other types of electrodes that require a larger size of conductor, the grounding electrode conductor shall not be required to be larger than 4 AWG copper wire.

TABLE 250.66 *Grounding Electrode Conductor for Alternating-Current Systems*

Size of Largest Ungrounded Service-Entrance Conductor or Equivalent Area for Parallel Conductors ^a (AWG/kcmil)		Size of Grounding Electrode Conductor (AWG/kcmil)	
Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum ^b
2 or smaller	1/0 or smaller	8	6
1 or 1/0	2/0 or 3/0	6	4
2/0 or 3/0	4/0 or 250	4	2
Over 3/0	Over 250	2	1/0
through 350	through 500		
Over 350	Over 500	1/0	3/0
through 600	through 900		
Over 600	Over 900	2/0	4/0
through 1100	through 1750		
Over 1100	Over 1750	3/0	250

Notes:

1. If multiple sets of service-entrance conductors connect directly to a service drop, set of overhead service conductors, set of underground service conductors, or service lateral, the equivalent size of the largest service-entrance conductor shall be determined by the largest sum of the areas of the corresponding conductors of each set.

2. Where there are no service-entrance conductors, the grounding electrode conductor size shall be determined by the equivalent size of the largest service-entrance conductor required for the load to be served.

^aThis table also applies to the derived conductors of separately derived ac systems.

^bSee installation restrictions in 250.64(A).

(C) Connections to Ground Rings. If the grounding electrode conductor or bonding jumper connected to a ground ring, as described in 250.52(A)(4), does not extend on to other types of electrodes that require a larger size of conductor, the grounding electrode conductor shall not be required to be larger than the conductor used for the ground ring.

Exhibit 250.30 illustrates a grounding electrode conductor (GEC) installed from service equipment or from a separately derived system to a water pipe grounding electrode. The GEC is required by 250.66 to be sized based on the size of the ungrounded supply conductors. The bonding jumpers that connect the other grounding electrodes together are sized using 250.53(C), which refers to 250.66. GECs and bonding jumpers are permitted to be sized based on the electrodes they connect to, as specified in 250.66(A), (B), or (C). However, if the GEC or bonding jumper extends from this connection to an electrode that is not specified in 250.66(A), (B), or (C), it must be sized per Table 250.66.

In Exhibit 250.30, the size of the GEC and bonding jumpers is dependent on the electrode to which they are connected. The illustration is not intended to show a mandatory physical routing and connection order of the bonding jumpers and the GEC, since the NEC does not specify an order or hierarchy for these connections. The sizes for the bonding jumpers to the ground rod and the concrete-encased electrode shown in Exhibit 250.30 are the maximum sizes required by the NEC based on

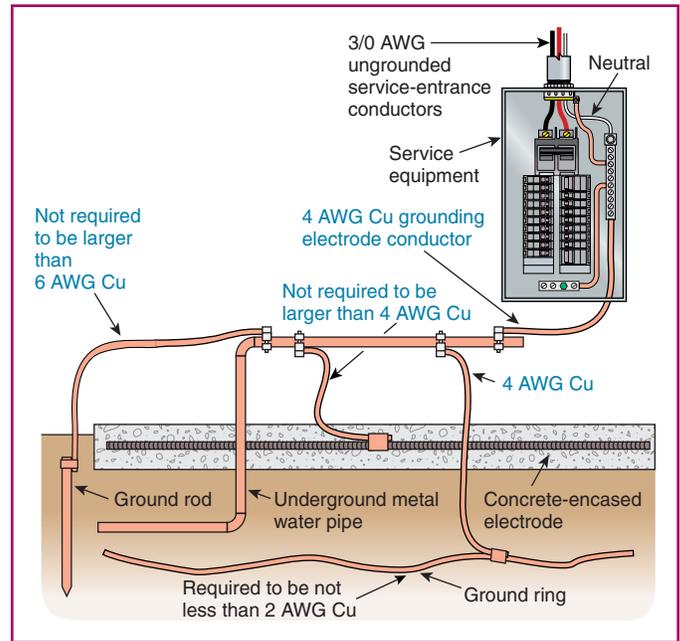

EXHIBIT 250.30 *Grounding electrode conductor and bonding jumpers sized in accordance with 250.66 for a service supplied by 3/0 AWG copper ungrounded conductors.*

250.66(A) and (B). If the GEC from the service equipment is run to the ground rod first and then to the water pipe, the GEC to the ground rod is required to be sized based on Table 250.66 as if it were run to the water pipe electrode. The use of bonding jumpers or GECs larger than required by 250.66 is not prohibited.

250.68 Grounding Electrode Conductor and Bonding Jumper Connection to Grounding Electrodes.

The connection of a grounding electrode conductor at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at a separately derived system and associated bonding jumper(s) shall be made as specified 250.68(A) through (C).

(A) Accessibility. All mechanical elements used to terminate a grounding electrode conductor or bonding jumper to a grounding electrode shall be accessible.

Exception No. 1: An encased or buried connection to a concrete-encased, driven, or buried grounding electrode shall not be required to be accessible.

Exception No. 2: Exothermic or irreversible compression connections used at terminations, together with the mechanical means used to attach such terminations to fireproofed structural metal whether or not the mechanical means is reversible, shall not be required to be accessible.

Ground clamps and other connectors suitable for use where buried in earth or embedded in concrete must be listed for such use per 250.70. Indication of this listing is either by a marking on the connector or by a tag attached to the connector. See Exhibits 250.23 and 250.24 for illustrations of encased and buried electrodes.

Connections, including the mechanical attachment of a compression lug to structural steel, are permitted to be encapsulated by fireproofing material and are not required to be accessible. This recognizes the importance of maintaining the integrity of the structural fireproofing.

(B) Effective Grounding Path. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure an effective grounding path. Where necessary to ensure the grounding path for a metal piping system used as a grounding electrode, bonding shall be provided around insulated joints and around any equipment likely to be disconnected for repairs or replacement. Bonding jumpers shall be of sufficient length to permit removal of such equipment while retaining the integrity of the grounding path.

Water meters and water filter systems are examples of equipment likely to be disconnected for repairs or replacement. Shorter bonding jumpers are more likely to be disconnected to facilitate removal or reinstallation of a water meter or filter cartridge. The bonding jumper must be long enough to permit removal of such equipment without disconnecting or otherwise interrupting the bonding jumper.

(C) Grounding Electrode Conductor Connections. Grounding electrode conductors and bonding jumpers shall be permitted to be connected at the following locations and used to extend the connection to an electrode(s):

- (1) Interior metal water piping that is electrically continuous with a metal underground water pipe electrode and is located not more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted to extend the connection to an electrode(s). Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a conductor to interconnect electrodes of the grounding electrode system.

Exception: In industrial, commercial, and institutional buildings or structures, if conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a bonding conductor to interconnect electrodes that are part of the grounding electrode system, or as a grounding electrode conductor, if the entire length, other than short sections passing perpendicularly through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.

The piping at this point is not a grounding electrode [only the underground portion is an electrode per 250.52(A)(1)]. Rather, it is used to extend grounding and bonding conductor connections to the grounding electrode. The exception permits connections beyond the first 5 feet, and at that point the water piping is considered a conductor used for bonding grounding electrodes together or is considered the actual grounding electrode conductor.

- (2) The metal structural frame of a building shall be permitted to be used as a conductor to interconnect electrodes that are part of the grounding electrode system, or as a grounding

electrode conductor. Hold-down bolts securing the structural steel column that are connected to a concrete-encased electrode that complies with 250.52(A)(3) and is located in the support footing or foundation shall be permitted to connect the metal structural frame of a building or structure to the concrete encased grounding electrode. The hold-down bolts shall be connected to the concrete-encased electrode by welding, exothermic welding, the usual steel tie wires, or other approved means.

The structural metal frame of a building is not a grounding electrode unless it extends into the earth for 10 feet or more, as specified in 250.52(A)(2).

See also

250.104(A) and (C) for the bonding requirements of metal water piping systems and structural metal frames

- (3) A rebar type concrete-encased electrode installed in accordance with 250.52(A)(3) with an additional rebar section extended from its location within the concrete to an accessible location that is not subject to corrosion shall be permitted for connection of grounding electrode conductors and bonding jumpers. The rebar extension shall not be exposed to contact with the earth without corrosion protection.

If rebar is used to form the concrete-encased electrode, it is permitted to extend out of the concrete to an accessible location for connection to a grounding electrode conductor or bonding jumper. Contact between unprotected rebar and earth can cause corrosion and is prohibited. Over time this corrosion will deteriorate the rebar and eliminate the connection to the electrode in the concrete.

250.70 Methods of Grounding and Bonding Conductor Connection to Electrodes. The grounding or bonding conductor shall be connected to the grounding electrode by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Connections depending on solder shall not be used. Ground clamps shall be listed for the materials of the grounding electrode and the grounding electrode conductor and, where used on pipe, rod, or other buried electrodes, shall also be listed for direct soil burial or concrete encasement. Not more than one conductor shall be connected to the grounding electrode by a single clamp or fitting unless the clamp or fitting is listed for multiple conductors. One of the following methods shall be used:

- (1) A pipe fitting, pipe plug, or other approved device screwed into a pipe or pipe fitting
- (2) A listed bolted clamp of cast bronze or brass, or plain or malleable iron
- (3) For indoor communications purposes only, a listed sheet metal strap-type ground clamp having a rigid metal base that seats on the electrode and having a strap of such material and dimensions that it is not likely to stretch during or after installation
- (4) An equally substantial approved means

EXHIBIT 250.31 An application of a listed ground clamp.

If a ground clamp is connected to a galvanized water pipe, the clamp must be of a material compatible with steel to prevent galvanic corrosion. This also applies to ground clamps used with grounding electrodes made of other materials such as copper or steel reinforcing rods or bars.

Exhibit 250.3 shows a listed water pipe ground clamp generally used with 8 AWG through 4 AWG grounding electrode conductors.

Part IV. Enclosure, Raceway, and Service Cable Connections

250.80 Service Raceways and Enclosures. Metal enclosures and raceways for service conductors and equipment shall be connected to the grounded system conductor if the electrical system is grounded or to the grounding electrode conductor for electrical systems that are not grounded.

Exception: Metal components that are installed in a run of underground nonmetallic raceway(s) and are isolated from possible contact by a minimum cover of 450 mm (18 in.) to all parts of the metal components shall not be required to be connected to the grounded system conductor, supply side bonding jumper, or grounding electrode conductor.

Metal elbows are often installed because nonmetallic elbows can be damaged from the friction caused by taut conductor pull lines or ropes rubbing against the interior of the elbow throat. The elbows can be isolated from physical contact by burying all metal components at a depth of 18 inches or more below grade. This exception applies where isolated metal components are used in a service raceway installation. Installations of raceways

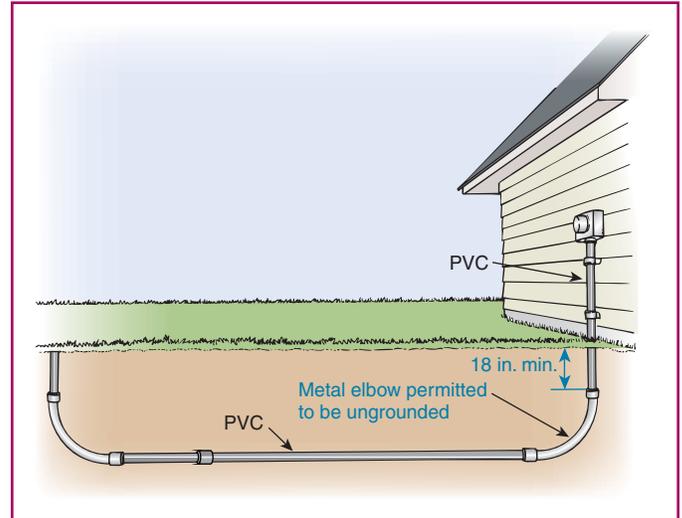

EXHIBIT 250.32 Metal elbows permitted to be ungrounded, provided they are isolated from contact by a minimum cover of 18 inches to any part of the elbow.

containing other than service conductors can be found in 250.86, Exception No. 3. See Exhibit 250.32 for an example of this application.

250.84 Underground Service Cable or Raceway.

(A) Underground Service Cable. The sheath or armor of a continuous underground metal-sheathed or armored service cable system that is connected to the grounded system conductor on the supply side shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway or piping.

(B) Underground Service Raceway Containing Cable. An underground metal service raceway that contains a metal-sheathed or armored cable connected to the grounded system conductor shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway or piping.

250.86 Other Conductor Enclosures and Raceways. Except as permitted by 250.112(I), metal enclosures and raceways for other than service conductors shall be connected to the equipment grounding conductor.

Exception No. 1: Metal enclosures and raceways for conductors added to existing installations of open wire, knob-and-tube wiring, and nonmetallic-sheathed cable shall not be required to be connected to the equipment grounding conductor where these enclosures or wiring methods comply with (1) through (4) as follows:

- (1) Do not provide an equipment ground
- (2) Are in runs of less than 7.5 m (25 ft)

- (3) Are free from probable contact with ground, grounded metal, metal lath, or other conductive material
- (4) Are guarded against contact by persons

Exception No. 2: Short sections of metal enclosures or raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be connected to the equipment grounding conductor.

Exception No. 3: Metal components shall not be required to be connected to the equipment grounding conductor or supply-side bonding jumper where either of the following conditions exist:

- (1) The metal components are installed in a run of nonmetallic raceway(s) and isolated from possible contact by a minimum cover of 450 mm (18 in.) to any part of the metal components.
- (2) The metal components are part of an installation of non-metallic raceway(s) and are isolated from possible contact to any part of the metal components by being encased in not less than 50 mm (2 in.) of concrete.

Connectors, couplings, or other similar fittings that perform mechanical and electrical functions must ensure bonding and grounding continuity between the fitting, the metal raceway, and the enclosure. Metal enclosures must be grounded so that when a fault occurs between an ungrounded (hot) conductor and ground, the potential difference between the non-current-carrying parts of the electrical installation is minimized, thereby reducing the risk of shock.

Part V. Bonding

250.90 General. Bonding shall be provided where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed.

250.92 Services.

(A) Bonding of Equipment for Services. The normally non-current-carrying metal parts of equipment indicated in 250.92(A)(1) and (A)(2) shall be bonded together.

- (1) All raceways, cable trays, cablebus framework, auxiliary gutters, or service cable armor or sheath that enclose, contain, or support service conductors, except as permitted in 250.80
- (2) All enclosures containing service conductors, including meter fittings, boxes, or the like, interposed in the service raceway or armor

(B) Method of Bonding at the Service. Bonding jumpers meeting the requirements of this article shall be used around impaired connections, such as reducing washers or oversized, concentric, or eccentric knockouts. Standard locknuts or bushings shall not be the only means for the bonding required by this section but shall be permitted to be installed to make a mechanical connection of the raceway(s).

Electrical continuity at service equipment, service raceways, and service conductor enclosures shall be ensured by one of the following methods:

Standard locknuts, sealing locknuts, and metal bushings are not acceptable as the sole means for bonding a raceway or cable to an enclosure on the line side of the service disconnecting means. For concentric, eccentric, or oversized knockouts, electrical continuity must be ensured through the use of a supply-side bonding jumper that connects the raceway to the enclosure. If these knockouts were in service enclosures, they would impede the bonding connections. Bonding jumpers are required in these situations. They would also be required if reducing washers are used to provide a suitable path for the high level of ground-fault current that is available on the line side of the service disconnecting means. For further information on concentric and eccentric knockouts, see the commentary following the definition of *bonding jumper* in Article 100 and the example shown in Exhibit 100.4.

- (1) Bonding equipment to the grounded service conductor in a manner provided in 250.8

Exhibit 250.33 illustrates one acceptable grounding and bonding arrangement at a service that has one disconnecting means. Exhibit 250.34 illustrates one acceptable grounding and bonding arrangement for a service that has three disconnecting means as permitted by 230.71(A).

See also

250.24(C), which specifies that the grounded service conductor must be run to each service disconnecting means and be bonded to the disconnecting means enclosure

250.92(B)(1), which permits the bonding of service equipment enclosures to be accomplished by bonding the grounded service conductor to the enclosure

- (2) Connections utilizing threaded couplings or threaded hubs on enclosures if made up wrenchtight

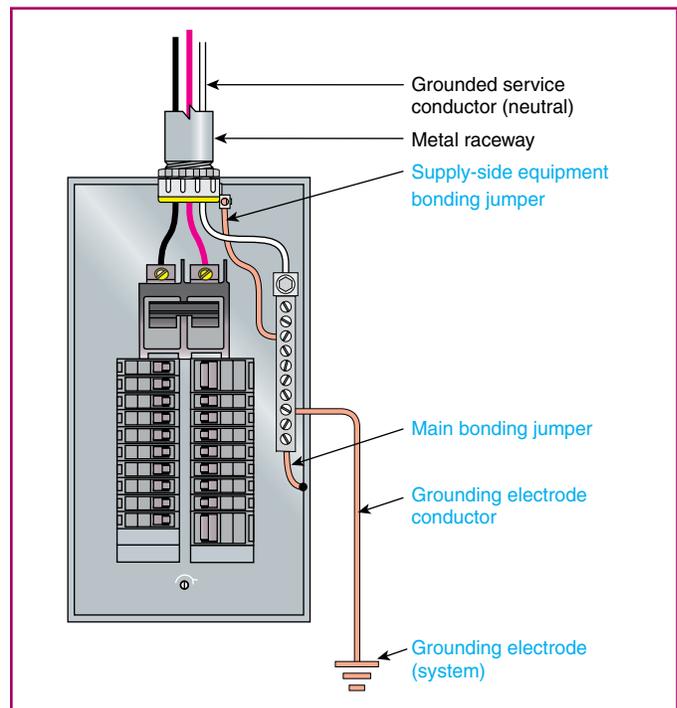

EXHIBIT 250.33 Grounding and bonding arrangement for a service with one disconnecting means.

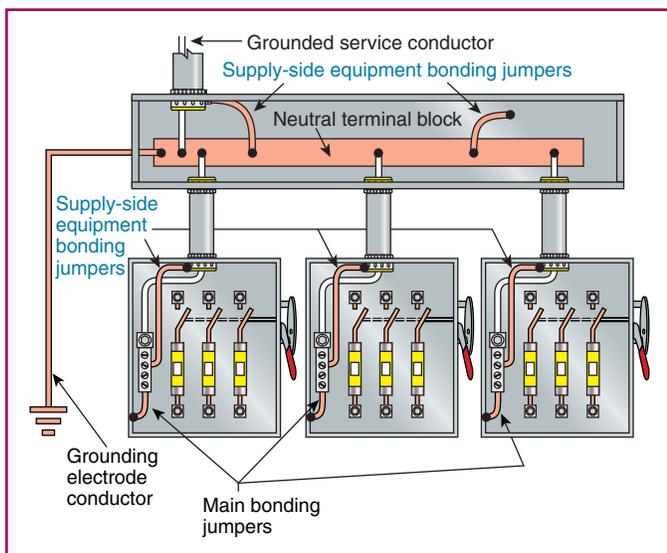

EXHIBIT 250.34 Grounding and bonding arrangement for a service with three disconnecting means.

- (3) Threadless couplings and connectors if made up tight for metal raceways and metal-clad cables
- (4) Other listed devices, such as bonding-type locknuts, bushings, or bushings with bonding jumpers

Bonding-type locknuts and grounding and bonding bushings for use with rigid or intermediate metal conduit are provided with means (usually one or more set screws that make positive contact with the conduit) for reliably bonding the bushing and the conduit on which it is threaded to the metal equipment enclosure or box.

Grounding bushings used with fittings for rigid or intermediate metal conduit or with EMT have means for connecting a bonding jumper or have means provided by the manufacturer for use in mounting a wire connector. (See [Exhibit 250.35](#).) This type of bushing may also

EXHIBIT 250.35 Grounding bushings used to connect a copper bonding or grounding wire to conduits. (Courtesy of Thomas and Betts, a Member of the ABB Group)

EXHIBIT 250.36 A grounding wedge lug used to provide an electrical connection between a conduit and a box. (Courtesy of Thomas and Betts, a Member of the ABB Group)

have one or more set screws to reliably bond the bushing to the conduit. [Exhibit 250.36](#) shows a listed bonding-type wedge lug used to connect a conduit to a box and provide the bonding connection required by [250.92\(B\)](#).

250.94 Bonding for Communication Systems. Communications system bonding terminations shall be connected in accordance with (A) or (B).

(A) The Intersystem Bonding Termination Device. An intersystem bonding termination (IBT) for connecting intersystem bonding conductors shall be provided external to enclosures at the service equipment or metering equipment enclosure and at the disconnecting means for any additional buildings or structures. If an IBT is used, it shall comply with the following:

- (1) Be accessible for connection and inspection.
- (2) Consist of a set of terminals with the capacity for connection of not less than three intersystem bonding conductors.
- (3) Not interfere with opening the enclosure for a service, building or structure disconnecting means, or metering equipment.

Intersystem means that the electrical system and other systems such as communications ([Article 800](#)), CATV ([Article 820](#)), and broadband systems ([Articles 830 and 840](#)) are bonded together to minimize the occurrence of potential differences between equipment of different systems. [Exhibit 250.37](#) is an example of an intersystem bonding termination that is to be installed and connected as specified in [250.94\(A\)\(1\)](#) through (6).

- (4) At the service equipment, be securely mounted and electrically connected to an enclosure for the service equipment, to the meter enclosure, or to an exposed nonflexible metallic service raceway, or be mounted at one of these enclosures and be connected to the enclosure or to the grounding electrode conductor with a minimum 6 AWG copper conductor.

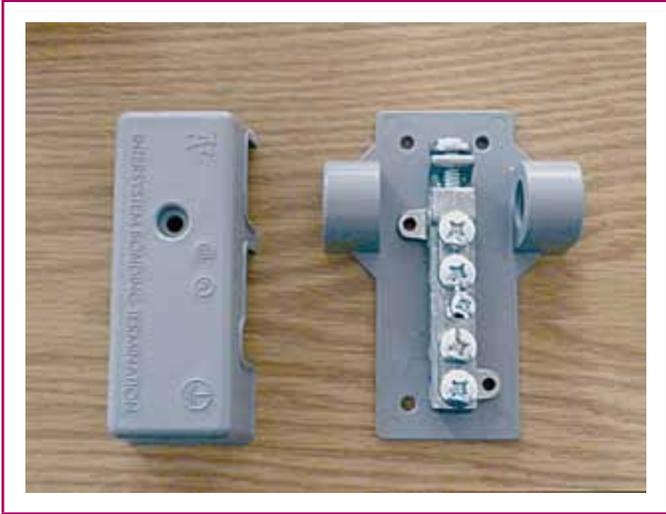

EXHIBIT 250.37 A listed intersystem bonding termination providing the required number of terminals (minimum of three) for connecting other building systems to the grounding system of the electrical power supply.

- (5) At the disconnecting means for a building or structure, be securely mounted and electrically connected to the metallic enclosure for the building or structure disconnecting means, or be mounted at the disconnecting means and be connected to the metallic enclosure or to the grounding electrode conductor with a minimum 6 AWG copper conductor.
- (6) The terminals shall be listed as grounding and bonding equipment.

Exception: In existing buildings or structures where any of the intersystem bonding and grounding electrode conductors required by 770.100(B)(2), 800.100(B)(2), 810.21(F)(2), 820.100(B)(2), and 830.100(B)(2) exist, installation of the intersystem bonding termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:

- (1) Exposed nonflexible metallic raceways
- (2) An exposed grounding electrode conductor
- (3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding electrode conductor to the grounded raceway or equipment

The intersystem bonding points at an existing building or structure can be installed with the connection points as shown in Exhibit 250.38. An intersystem bonding termination of the type shown in Exhibit 250.37 is not required to be installed under the conditions of this exception.

Informational Note No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in 250.94, Exception item (3).

Informational Note No. 2: See 770.100, 800.100, 810.21, 820.100, and 830.100 for intersystem bonding and grounding requirements

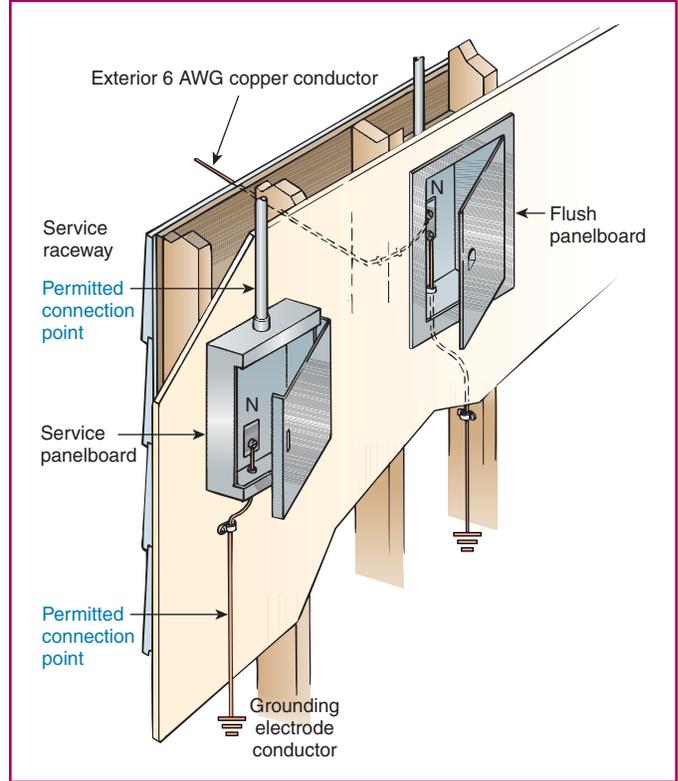

EXHIBIT 250.38 Methods of providing intersystem bonding at an existing building or structure.

for conductive optical fiber cables, communications circuits, radio and television equipment, CATV circuits and network-powered broadband communications systems, respectively.

Lightning protection systems, communications, radio and TV, and CATV systems are required to be bonded together to minimize the potential differences between the systems. Lack of interconnection can result in a severe shock and fire hazard due to these differences in potential. Exhibit 250.39 illustrates a CATV cable that is connected to the cable

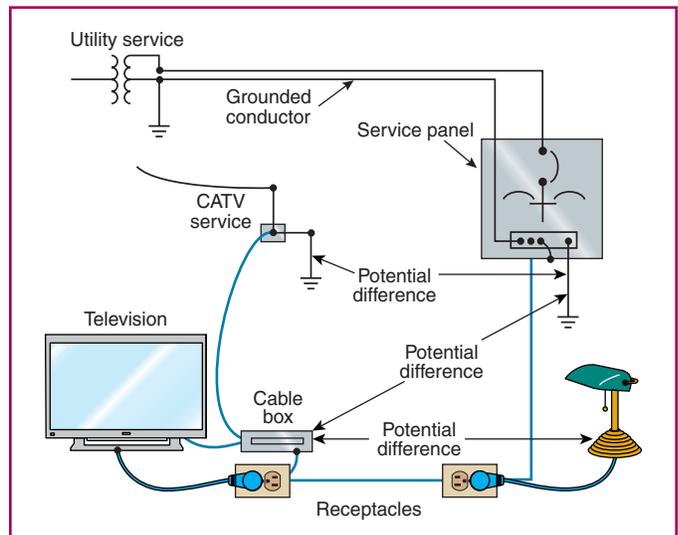

EXHIBIT 250.39 A CATV installation that does not comply with the NEC, illustrating why bonding between different systems is necessary.

CLOSER LOOK: A Potential Hazard

For the typical home CATV installation shown in [Exhibit 250.39](#), assume that a current is induced in the power line by a switching surge or a nearby lightning strike, so that a momentary current of 1000 amperes occurs over the power line to the power line ground. This amount of current is not unusual under such circumstances — the current is often considerably higher. Also assume that the service grounding electrode has a resistance of 10 ohms, which is a lower value than usually encountered.

Using Ohm's law, we can calculate that the current through the equipment connected to the electrical system will be raised momentarily to a potential of 10,000 volts (1000 amperes \times 10 ohms). This potential of 10,000 volts would exist between the CATV system and the electrical system and between the grounded conductor within the CATV cable and the grounded surfaces of the home, such as heating or water piping systems (which are connected to the power ground). This potential could also appear across a person with one hand on the CATV cable and the other hand on a grounded metal surface.

Actual voltage could be much greater than the 10,000 volts calculated, because extremely low (below normal) values were assumed for both resistance to ground and current. Most insulation systems, however, are not designed to withstand 10,000 volts. Even if the insulation system does withstand a 10,000-volt surge, it is likely to be damaged, and breakdown of the insulation system can result in arcing.

Another situation could exist if the current surge were on the CATV cable or a telephone line. The only difference would be the

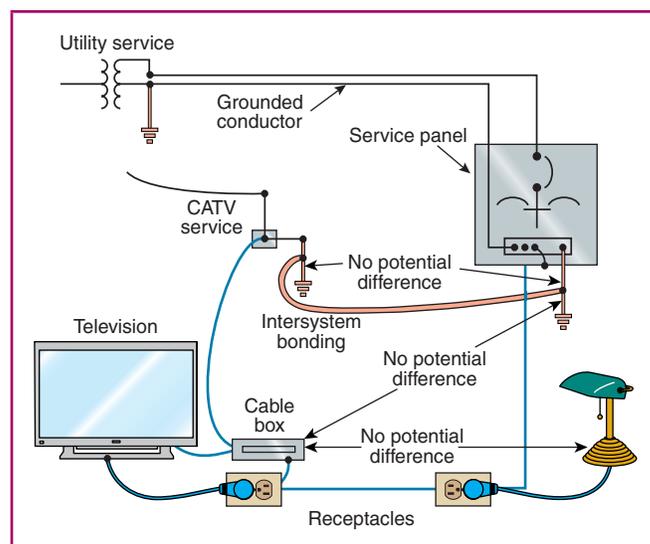

EXHIBIT 250.40 A cable TV installation that complies with 250.94.

voltage involved, which would depend on the individual resistance to ground of the grounding electrodes.

The solution required by the NEC is to bond the two grounding electrode systems together, as shown in [Exhibit 250.40](#), or to connect the CATV cable jacket to the power ground. When one system is raised above ground potential, the second system rises to the same potential, and no voltage exists between the two grounding systems.

decoder and the tuner of a television set. Also connected to the decoder and the television is the 120-volt supply, with one conductor grounded at the service (the power ground). In each case, resistance to ground is present at the grounding electrode. This resistance to ground varies depending on soil conditions and the type of grounding electrode. For more information, see the accompanying Closer Look feature.

The bonding requirement of [250.94](#) addresses the difficulties sometimes encountered by communications and CATV installers trying to properly bond their respective systems together and to the electrical supply system. In the past, bonding between communications, CATV, and power systems was usually achieved by connecting the communications protector grounds or cable shield to an interior metal water pipe, because the pipe was often used as the power grounding electrode. Thus, the requirement that the power, communications, CATV cable shield, and metal water piping systems be bonded together was easily satisfied. If the power system was grounded to one of the other electrodes permitted by the NEC (usually by a made electrode such as a ground rod), the bond was connected to the power grounding electrode conductor (GEC) or to a metal service raceway, since at least one of these was usually accessible.

With the increased use of nonmetallic water pipe and the service equipment sometimes flush-mounted in finished areas, the GEC is typically concealed. With the increased use of nonmetallic service-entrance conduit, communications and CATV installers often do not have access to a suitable point for connecting bonding jumpers or GECs. In these situations, an intersystem bonding termination device is needed.

See also

[820.100\(D\)](#) for more information on grounding of CATV systems

(B) Other Means. Connections to an aluminum or copper busbar not less than 6 mm thick \times 50 mm wide ($\frac{1}{4}$ in. thick \times 2 in. wide) and of sufficient length to accommodate at least three terminations for communication systems in addition to other connections. The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector. If aluminum busbars are used, the installation shall also comply with [250.64\(A\)](#).

Exception to (A) and (B): Means for connecting intersystem bonding conductors are not required where communications systems are not likely to be used.

Informational Note: The use of an IBT can reduce electrical noise on communication systems.

250.96 Bonding Other Enclosures.

(A) General. Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal non-current-carrying parts that are to serve as equipment grounding conductors, with or without the use of supplementary equipment grounding conductors, shall be bonded where necessary to ensure electrical continuity and the capacity to conduct safely

any fault current likely to be imposed on them. Any nonconductive paint, enamel, or similar coating shall be removed at threads, contact points, and contact surfaces or shall be connected by means of fittings designed so as to make such removal unnecessary.

(B) Isolated Grounding Circuits. Where installed for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, an equipment enclosure supplied by a branch circuit shall be permitted to be isolated from a raceway containing circuits supplying only that equipment by one or more listed nonmetallic raceway fittings located at the point of attachment of the raceway to the equipment enclosure. The metal raceway shall comply with provisions of this article and shall be supplemented by an internal insulated equipment grounding conductor installed in accordance with 250.146(D) to ground the equipment enclosure.

Informational Note: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system.

Exhibits 250.41 and 250.42 illustrate installations with isolated EGCs. In Exhibit 250.41, the metal raceway is bonded through its attachment to the grounded service equipment enclosure, which provides equipment grounding for the raceway. In Exhibit 250.42, the isolated EGC (which is required to be insulated in order to prevent inadvertent contact with grounded enclosures and raceways) passes through the downstream feeder panelboard and terminates in the service equipment, as permitted by 408.40, Exception. In order to meet the performance objectives for the grounding and bonding of electrical equipment specified in 250.4(A)(5), the insulated EGC must be connected in a manner that creates an effective path for ground-fault current. The connection point is permitted to be at any location on the distribution system to minimize the electrical noise to an acceptable level.

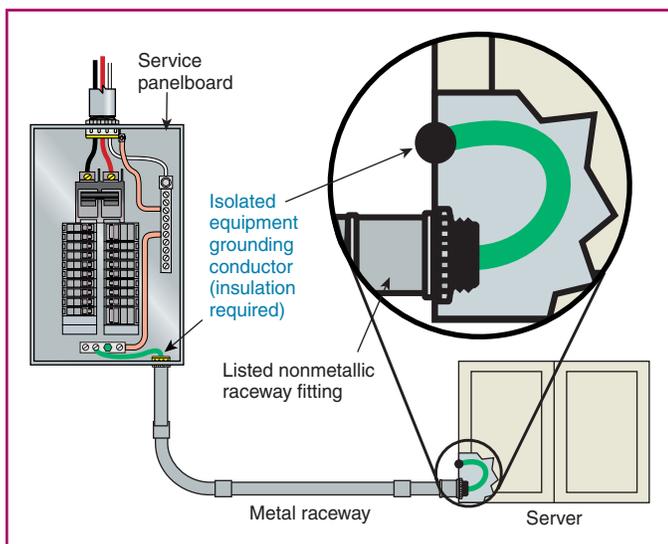

EXHIBIT 250.41 An installation in which the electronic equipment is grounded through the isolated EGC.

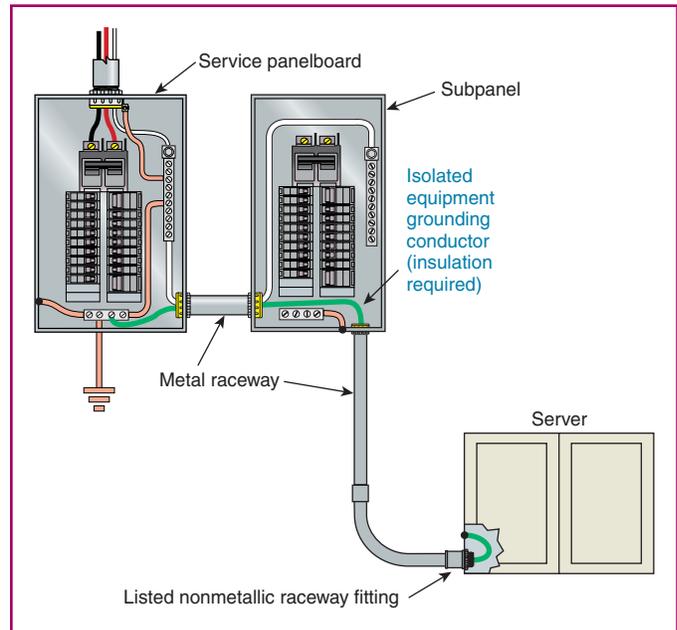

EXHIBIT 250.42 An installation in which the isolated EGC is allowed to pass through the subpanel without connecting to the grounding bus to terminate at the service grounding bus.

250.97 Bonding for Over 250 Volts. For circuits of over 250 volts to ground, the electrical continuity of metal raceways and cables with metal sheaths that contain any conductor other than service conductors shall be ensured by one or more of the methods specified for services in 250.92(B), except for (B)(1).

Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts is listed to provide a reliable bonding connection, the following methods shall be permitted:

- (1) Threadless couplings and connectors for cables with metal sheaths
- (2) Two locknuts, on rigid metal conduit or intermediate metal conduit, one inside and one outside of boxes and cabinets
- (3) Fittings with shoulders that seat firmly against the box or cabinet, such as electrical metallic tubing connectors, flexible metal conduit connectors, and cable connectors, with one locknut on the inside of boxes and cabinets
- (4) Listed fittings

Bonding around pre-punched concentric or eccentric knockouts is not required if the enclosure containing the knockouts is listed as suitable for bonding. Fittings, such as EMT connectors, cable connectors, and similar fittings with shoulders that seat firmly against the metal of a box or cabinet, are permitted to be installed with only one locknut on the inside of the box.

Guide card information from the *UL Guide Information for Electrical Equipment — The White Book* indicates that concentric and eccentric knockouts of all metal outlet boxes evaluated in accordance with UL 514A, *Metallic Outlet Boxes*, are suitable for bonding without the use of additional bonding equipment, such as bonding-type locknuts or bonding bushings. The guide card information further indicates that metal outlet boxes may be marked to indicate this condition of use.

250.98 Bonding Loosely Jointed Metal Raceways. Expansion fittings and telescoping sections of metal raceways shall be made electrically continuous by equipment bonding jumpers or other means.

250.100 Bonding in Hazardous (Classified) Locations. Regardless of the voltage of the electrical system, the electrical continuity of non-current-carrying metal parts of equipment, raceways, and other enclosures in any hazardous (classified) location, as defined in 500.5, 505.5, and 506.5, shall be ensured by any of the bonding methods specified in 250.92(B)(2) through (B)(4). One or more of these bonding methods shall be used whether or not equipment grounding conductors of the wire type are installed.

Informational Note: See 501.30, 502.30, 503.30, 505.25, or 506.25 for specific bonding requirements.

250.102 Grounded Conductor, Bonding Conductors, and Jumpers.

(A) Material. Bonding jumpers shall be of copper, aluminum, copper-clad aluminum, or other corrosion-resistant material. A

bonding jumper shall be a wire, bus, screw, or similar suitable conductor.

(B) Attachment. Bonding jumpers shall be attached in the manner specified by the applicable provisions of 250.8 for circuits and equipment and by 250.70 for grounding electrodes.

(C) Size — Supply-Side Bonding Jumper.

(1) Size for Supply Conductors in a Single Raceway or Cable. The supply-side bonding jumper shall not be smaller than specified in Table 250.102(C)(1).

(2) Size for Parallel Conductor Installations in Two or More Raceways or Cables. Where the ungrounded supply conductors are paralleled in two or more raceways or cables, and an individual supply-side bonding jumper is used for bonding these raceways or cables, the size of the supply-side bonding jumper for each raceway or cable shall be selected from Table 250.102(C)(1) based on the size of the ungrounded supply conductors in each raceway or cable. A single supply-side bonding jumper installed for bonding two or more raceways or cables shall be sized in accordance with 250.102(C)(1).

TABLE 250.102(C)(1) Grounded Conductor, Main Bonding Jumper, System Bonding Jumper, and Supply-Side Bonding Jumper for Alternating-Current Systems

Size of Largest Ungrounded Conductor or Equivalent Area for Parallel Conductors (AWG/kcmil)		Size of Grounded Conductor or Bonding Jumper* (AWG/kcmil)	
Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum
2 or smaller	1/0 or smaller	8	6
1 or 1/0	2/0 or 3/0	6	4
2/0 or 3/0	4/0 or 250	4	2
Over 3/0 through 350	Over 250 through 500	2	1/0
Over 350 through 600	Over 500 through 900	1/0	3/0
Over 600 through 1100	Over 900 through 1750	2/0	4/0
Over 1100	Over 1750	See Notes 1 and 2.	

Notes:

1. If the ungrounded supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor or bonding jumper shall have an area not less than 12½ percent of the area of the largest ungrounded supply conductor or equivalent area for parallel supply conductors. The grounded conductor or bonding jumper shall not be required to be larger than the largest ungrounded conductor or set of ungrounded conductors.

2. If the ungrounded supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum and if the ungrounded supply conductors and the bonding jumper are of different materials (copper, aluminum, or copper-clad aluminum), the minimum size of the grounded conductor or bonding jumper shall be based on the assumed use of ungrounded supply conductors of the same material as the grounded conductor or bonding jumper and will have an ampacity equivalent to that of the installed ungrounded supply conductors.

3. If multiple sets of service-entrance conductors are used as permitted in 230.40, Exception No. 2, or if multiple sets of ungrounded supply conductors are installed for a separately derived system, the equivalent size of the largest ungrounded supply conductor(s) shall be determined by the largest sum of the areas of the corresponding conductors of each set.

4. If there are no service-entrance conductors, the supply conductor size shall be determined by the equivalent size of the largest service-entrance conductor required for the load to be served.

*For the purposes of applying this table and its notes, the term *bonding jumper* refers to main bonding jumpers, system bonding jumpers, and supply-side bonding jumpers.

CLOSER LOOK: Sizing Supply-Side Bonding Jumpers

Similar to the way that the main bonding jumper is sized per 250.28(D), supply-side bonding jumpers are sized based on the size of the ungrounded conductors of which they are associated. If the ungrounded conductors are 1100 kcmil copper or 1750 kcmil aluminum or smaller, the supply-side bonding jumper is selected from Table 250.102(C)(1) based on the size of the largest ungrounded supply conductor. If the ungrounded conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the size of the supply-side bonding jumper(s) is calculated based on 12.5 percent of the area of the largest ungrounded supply conductor, or the equivalent area of the parallel supply conductors. Where an installation consists of multiple raceways for parallel conductors, an individual supply-side bonding jumper can be installed for each raceway, and this jumper is sized based on the size of the ungrounded conductors in that raceway.

Application Example

A 3-phase, 1600-A service is supplied using five 350 kcmil THWN conductors per phase. The parallel conductors are installed in five separate runs of rigid metal conduit. In accordance with 300.12, Exception No. 2, a supply-side bonding jumper is needed for each raceway at the point it enters the open-bottom switchboard. Using 250.102(C)(2), determine the size of the supply-side bonding jumper.

Multiple supply-side bonding jumpers

Step 1. Determine the size of the largest ungrounded conductor in each raceway.

Step 2. Determine the size of the supply-side bonding jumper for each raceway using Table 250.102(C)(1).

Solution

For 350 kcmil supply conductors, use the “over 3/0 through 350” row of Table 250.102(C)(1). This results in a 2 AWG copper or 1/0 AWG aluminum supply-side bonding jumper.

Single supply-side bonding jumper

Step 1. Determine the equivalent area of parallel supply conductors.

Step 2. Determine the size of the supply-side bonding jumper using Table 250.102(C)(1), Note 1.

Solution

5 parallel 350 kcmil conductors:

$$\text{Total equivalent area} = 5 \times 350 = 1750 \text{ kcmil}$$

This total exceeds 1100 kcmil; therefore, the total is multiplied by 0.125 (12.5 percent)

$$1750 \text{ kcmil} \times 0.125 = 218.75 \text{ kcmil}$$

From Table 8 of Chapter 9, the next standard conductor size is 250 kcmil copper.

Informational Note No. 1: The term *supply conductors* includes ungrounded conductors that do not have overcurrent protection on their supply side and terminate at service equipment or the first disconnecting means of a separately derived system.

Informational Note No. 2: See Chapter 9, Table 8, for the circular mil area of conductors 18 AWG through 4/0 AWG.

(D) Size — Equipment Bonding Jumper on Load Side of an Overcurrent Device. The equipment bonding jumper on the load side of an overcurrent device(s) shall be sized in accordance with 250.122.

A single common continuous equipment bonding jumper shall be permitted to connect two or more raceways or cables if the bonding jumper is sized in accordance with 250.122 for the largest overcurrent device supplying circuits therein.

(E) Installation. Bonding jumpers or conductors and equipment bonding jumpers shall be permitted to be installed inside or outside of a raceway or an enclosure.

(1) Inside a Raceway or an Enclosure. If installed inside a raceway, equipment bonding jumpers and bonding jumpers or conductors shall comply with the requirements of 250.119 and 250.148.

(2) Outside a Raceway or an Enclosure. If installed on the outside, the length of the bonding jumper or conductor or

equipment bonding jumper shall not exceed 1.8 m (6 ft) and shall be routed with the raceway or enclosure.

Exception: An equipment bonding jumper or supply-side bonding jumper longer than 1.8 m (6 ft) shall be permitted at outside pole locations for the purpose of bonding or grounding isolated sections of metal raceways or elbows installed in exposed risers of metal conduit or other metal raceway, and for bonding grounding electrodes, and shall not be required to be routed with a raceway or enclosure.

For some metal raceway and rigid conduit systems, installing the bonding jumper where it is visible and accessible for inspection and maintenance is desirable. Exhibit 250.43 illustrates a bonding jumper run outside a length of flexible metal conduit.

(3) Protection. Bonding jumpers or conductors and equipment bonding jumpers shall be installed in accordance with 250.64(A) and (B).

250.104 Bonding of Piping Systems and Exposed Structural Metal.

(A) Metal Water Piping. The metal water piping system shall be bonded as required in (A)(1), (A)(2), or (A)(3) of this section.

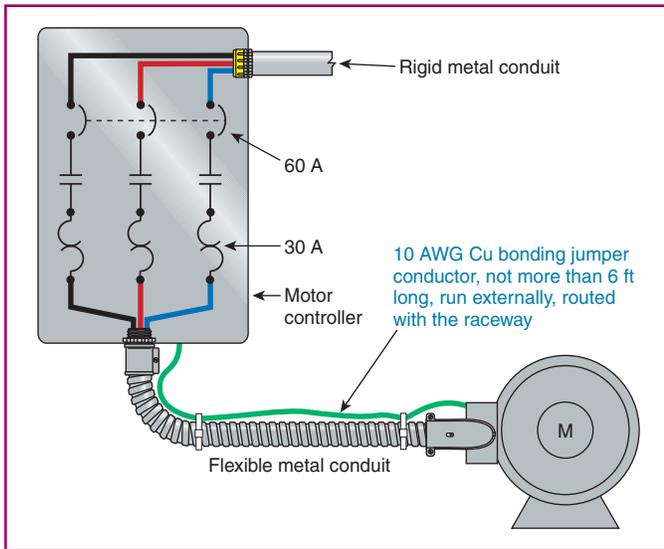

EXHIBIT 250.43 A bonding jumper along the outside of a flexible metal conduit.

(1) General. Metal water piping system(s) installed in or attached to a building or structure shall be bonded to any of the following:

- (1) Service equipment enclosure
- (2) Grounded conductor at the service
- (3) Grounding electrode conductor if of sufficient size
- (4) One or more grounding electrodes used, if the grounding electrode conductor or bonding jumper to the grounding electrode is of sufficient size

The bonding jumper(s) shall be installed in accordance with 250.64(A), 250.64(B), and 250.64(E). The points of attachment of the bonding jumper(s) shall be accessible. The bonding jumper(s) shall be sized in accordance with Table 250.102(C)(1) except as permitted in 250.104(A)(2) and 250.104(A)(3).

Bonding a metal water piping system is not the same as using the metal water piping system as a grounding electrode. Bonding to the grounding electrode system places the bonded components at the same voltage level.

Where it is not certain that the hot and cold water pipes are reliably bonded through mechanical connections, an electrical bonding jumper is required to ensure that this connection is made. Isolated sections of metal water piping (such as may be used for a plumbing fixture connection) that are connected to an overall nonmetallic water piping system are not subject to the requirements of 250.104(A). The isolated sections are not a metal water piping system.

See also

250.64(A), (B), and (E) for installation requirements that apply to the water piping bonding jumper

(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy where the metal water piping system(s) installed in or attached to a building or structure for the individual occupancies

is metallically isolated from all other occupancies by use of nonmetallic water piping, the metal water piping system(s) for each occupancy shall be permitted to be bonded to the equipment grounding terminal of the switchgear, switchboard, or panelboard enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with 250.102(D).

Metal water piping in multiple-occupancy buildings may be isolated by nonmetallic fittings and pipe. Therefore, the metal water pipe of an occupancy is permitted to be bonded to the panelboard or switchboard that serves only that particular occupancy. The bonding jumper, in this case, is permitted to be sized according to Table 250.122, based on the size of the main overcurrent device supplying the occupancy.

(3) Multiple Buildings or Structures Supplied by a Feeder(s) or Branch Circuit(s). The metal water piping system(s) installed in or attached to a building or structure shall be bonded to any of the following:

- (1) Building or structure disconnecting means enclosure where located at the building or structure
- (2) Equipment grounding conductor run with the supply conductors
- (3) One or more grounding electrodes used

The bonding jumper(s) shall be sized in accordance with Table 250.102(C)(1), based on the size of the feeder or branch-circuit conductors that supply the building or structure. The bonding jumper shall not be required to be larger than the largest ungrounded feeder or branch-circuit conductor supplying the building or structure.

(B) Other Metal Piping. If installed in or attached to a building or structure, a metal piping system(s), including gas piping, that is likely to become energized shall be bonded to any of the following:

- (1) Equipment grounding conductor for the circuit that is likely to energize the piping system
- (2) Service equipment enclosure
- (3) Grounded conductor at the service
- (4) Grounding electrode conductor, if of sufficient size
- (5) One or more grounding electrodes used, if the grounding electrode conductor or bonding jumper to the grounding electrode is of sufficient size

The bonding conductor(s) or jumper(s) shall be sized in accordance with Table 250.122, and equipment grounding conductors shall be sized in accordance with Table 250.122 using the rating of the circuit that is likely to energize the piping system(s). The points of attachment of the bonding jumper(s) shall be accessible.

Informational Note No. 1: Bonding all piping and metal air ducts within the premises will provide additional safety.

Informational Note No. 2: Additional information for gas piping systems can be found in Section 7.13 of NFPA 54-2015, *National Fuel Gas Code*.

Where the phrase “likely to become energized” is used in the *NEC*, it means that the failure of electrical insulation on a conductor can cause normally non-current-carrying metal parts to become energized. Where mechanical and electrical connections are within equipment, a failure of electrical insulation can result in the connected piping system(s) becoming energized. For example, an insulation failure in an electrical circuit of a gas range could energize the metal gas piping.

The use of an additional bonding jumper is not necessary to comply with 250.104(B), because the equipment grounding connection to the non-current-carrying metal parts of the appliance also provides a bonding connection to the metal piping attached to the appliance. Section 250.104(B) requires the gas piping system be bonded. It does not make the gas piping part of the grounding electrode system. Therefore, this requirement does not conflict with 250.52(B)(1), which prohibits the use of metal underground gas piping as a grounding electrode. To prevent the underground gas piping from inadvertently becoming a grounding electrode, gas utilities usually provide an isolating fitting. Gas utility companies often provide cathodic protection of their underground metal piping system.

(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded or bonded and is likely to become energized shall be bonded to any of the following:

- (1) Service equipment enclosure
- (2) Grounded conductor at the service
- (3) Disconnecting means for buildings or structures supplied by a feeder or branch circuit
- (4) Grounding electrode conductor, if of sufficient size
- (5) One or more grounding electrodes used, if the grounding electrode conductor or bonding jumper to the grounding electrode is of sufficient size

The bonding conductor(s) or jumper(s) shall be sized in accordance with Table 250.102(C)(1) and installed in accordance with 250.64(A), 250.64(B), and 250.64(E). The points of attachment of the bonding jumper(s) shall be accessible unless installed in compliance with 250.68(A) Exception No. 2.

(D) Separately Derived Systems. Metal water piping systems and structural metal that is interconnected to form a building frame shall be bonded to separately derived systems in accordance with 250.104(D)(1) through 250.104(D)(3).

(1) Metal Water Piping System(s). The grounded conductor of each separately derived system shall be bonded to the nearest available point of the metal water piping system(s) in the area served by each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 250.102(C)(1) based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper to the metal water piping system shall not be required if the metal water piping system is used as the grounding electrode for the separately derived system and the water piping system is in the area served.

Exception No. 2: A separate water piping bonding jumper shall not be required if the metal frame of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the metal water piping in the area served by the separately derived system.

(2) Structural Metal. If exposed structural metal that is interconnected to form the building frame exists in the area served by the separately derived system, it shall be bonded to the grounded conductor of each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 250.102(C)(1) based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper to the building structural metal shall not be required if the metal frame of a building or structure is used as the grounding electrode for the separately derived system.

Exception No. 2: A separate bonding jumper to the building structural metal shall not be required if the water piping of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the building structural metal in the area served by the separately derived system.

(3) Common Grounding Electrode Conductor. If a common grounding electrode conductor is installed for multiple separately derived systems as permitted by 250.30(A)(6), and exposed structural metal that is interconnected to form the building frame or interior metal piping exists in the area served by the separately derived system, the metal piping and the structural metal member shall be bonded to the common grounding electrode conductor in the area served by the separately derived system.

Exception: A separate bonding jumper from each derived system to metal water piping and to structural metal members shall not be required if the metal water piping and the structural metal members in the area served by the separately derived system are bonded to the common grounding electrode conductor.

250.106 Lightning Protection Systems. The lightning protection system ground terminals shall be bonded to the building or structure grounding electrode system.

Informational Note No. 1: See 250.60 for use of strike termination devices. For further information, see NFPA 780-2014, *Standard for the Installation of Lightning Protection Systems*, which contains detailed information on grounding, bonding, and sideflash distance from lightning protection systems.

Informational Note No. 2: Metal raceways, enclosures, frames, and other non-current-carrying metal parts of electrical equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with NFPA 780-2014, *Standard for the Installation of Lightning Protection Systems*.

Exhibit 250.44 illustrates the bonding of the lightning protection system to the electrical service grounding electrode system. A similar requirement is

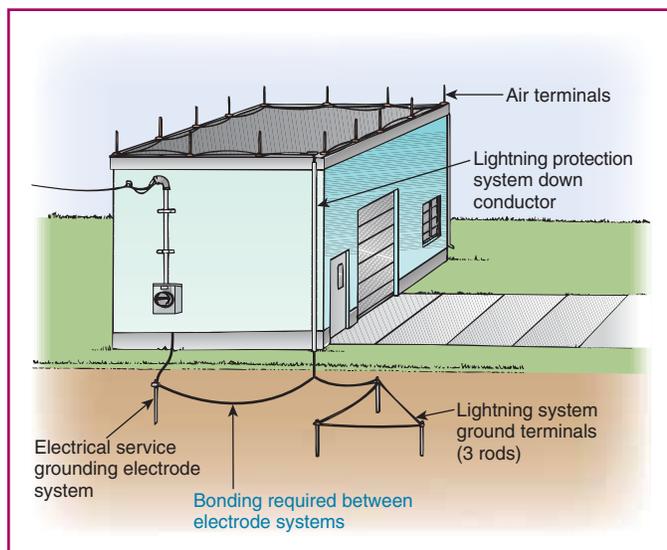

EXHIBIT 250.44 Bonding between the lightning system ground terminals and the electrical service grounding electrode system.

found in Section 4.14 of NFPA 780, *Standard for the Installation of Lightning Protection Systems*. Additional bonding between the lightning protection system and the electrical system may be necessary based on proximity and whether separation between the systems is through air or building materials. Subsections 4.16.2.5 and 4.16.2.6 of NFPA 780 describe a method for calculating bonding distances between grounded metal bodies and the lightning protection system.

Part VI. Equipment Grounding and Equipment Grounding Conductors

250.110 Equipment Fastened in Place (Fixed) or Connected by Permanent Wiring Methods. Exposed, normally non-current-carrying metal parts of fixed equipment supplied by or enclosing conductors or components that are likely to become energized shall be connected to an equipment grounding conductor under any of the following conditions:

- (1) Where within 2.5 m (8 ft) vertically or 1.5 m (5 ft) horizontally of ground or grounded metal objects and subject to contact by persons
- (2) Where located in a wet or damp location and not isolated
- (3) Where in electrical contact with metal
- (4) Where in a hazardous (classified) location as covered by [Articles 500](#) through [517](#)
- (5) Where supplied by a wiring method that provides an equipment grounding conductor, except as permitted by [250.86](#), Exception No. 2, for short sections of metal enclosures
- (6) Where equipment operates with any terminal at over 150 volts to ground

Exposed, non-current-carrying metal parts of fixed equipment that are not likely to become energized are not required to be grounded. These parts include some metal nameplates on nonmetallic enclosures and small parts such as bolts and screws.

Exception No. 1: If exempted by special permission, the metal frame of electrically heated appliances that have the frame permanently and effectively insulated from ground shall not be required to be grounded.

Exception No. 2: Distribution apparatus, such as transformer and capacitor cases, mounted on wooden poles at a height exceeding 2.5 m (8 ft) above ground or grade level shall not be required to be grounded.

Exception No. 3: Listed equipment protected by a system of double insulation, or its equivalent, shall not be required to be connected to the equipment grounding conductor. Where such a system is employed, the equipment shall be distinctively marked.

250.112 Specific Equipment Fastened in Place (Fixed) or Connected by Permanent Wiring Methods.

Except as permitted in [250.112\(F\)](#) and [\(I\)](#), exposed, normally non-current-carrying metal parts of equipment described in [250.112\(A\)](#) through [\(K\)](#), and normally non-current-carrying metal parts of equipment and enclosures described in [250.112\(L\)](#) and [\(M\)](#), shall be connected to an equipment grounding conductor, regardless of voltage.

(A) Switchgear and Switchboard Frames and Structures. Switchgear or switchboard frames and structures supporting switching equipment, except frames of 2-wire dc switchgear or switchboards where effectively insulated from ground.

(B) Pipe Organs. Generator and motor frames in an electrically operated pipe organ, unless effectively insulated from ground and the motor driving it.

(C) Motor Frames. Motor frames, as provided by [430.242](#).

(D) Enclosures for Motor Controllers. Enclosures for motor controllers unless attached to ungrounded portable equipment.

(E) Elevators and Cranes. Electrical equipment for elevators and cranes.

(F) Garages, Theaters, and Motion Picture Studios. Electrical equipment in commercial garages, theaters, and motion picture studios, except pendant lampholders supplied by circuits not over 150 volts to ground.

(G) Electric Signs. Electric signs, outline lighting, and associated equipment as provided in [600.7](#).

(H) Motion Picture Projection Equipment. Motion picture projection equipment.

(I) Remote-Control, Signaling, and Fire Alarm Circuits. Equipment supplied by Class 1 circuits shall be grounded unless operating at less than 50 volts. Equipment supplied by Class 1 power-limited circuits, by Class 2 and Class 3 remote-control and signaling circuits, and by fire alarm circuits shall be grounded where system grounding is required by [Part II](#) or [Part VIII](#) of this article.

(J) Luminaires. Luminaires as provided in Part V of Article 410.

(K) Skid-Mounted Equipment. Permanently mounted electrical equipment and skids shall be connected to the equipment grounding conductor sized as required by 250.122.

(L) Motor-Operated Water Pumps. Motor-operated water pumps, including the submersible type.

During normal operation or maintenance, a ground fault to the casing of a water pump can be a shock hazard if exposed or it could energize a metal well casing if the pump is a submersible type.

(M) Metal Well Casings. Where a submersible pump is used in a metal well casing, the well casing shall be connected to the pump circuit equipment grounding conductor.

This requirement is intended to prevent a shock hazard that could exist due to a potential difference between the pump (which is grounded to the system ground) and the metal well casing. This grounding and bonding connection also provides a return path for ground-fault current.

250.114 Equipment Connected by Cord and Plug. Under any of the conditions described in 250.114(1) through (4), exposed, normally non-current-carrying metal parts of cord-and-plug-connected equipment shall be connected to the equipment grounding conductor.

Exception: Listed tools, listed appliances, and listed equipment covered in 250.114(2) through (4) shall not be required to be connected to an equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

- (1) In hazardous (classified) locations (see Articles 500 through 517)
- (2) Where operated at over 150 volts to ground

Exception No. 1: Motors, where guarded, shall not be required to be connected to an equipment grounding conductor.

Exception No. 2: Metal frames of electrically heated appliances, exempted by special permission, shall not be required to be connected to an equipment grounding conductor, in which case the frames shall be permanently and effectively insulated from ground.

- (3) In residential occupancies:
 - a. Refrigerators, freezers, and air conditioners
 - b. Clothes-washing, clothes-drying, dish-washing machines; ranges; kitchen waste disposers; information technology equipment; sump pumps and electrical aquarium equipment
 - c. Hand-held motor-operated tools, stationary and fixed motor-operated tools, and light industrial motor-operated tools
 - d. Motor-operated appliances of the following types: hedge clippers, lawn mowers, snow blowers, and wet scrubbers
 - e. Portable handlamps

- (4) In other than residential occupancies:
 - a. Refrigerators, freezers, and air conditioners
 - b. Clothes-washing, clothes-drying, dish-washing machines; information technology equipment; sump pumps and electrical aquarium equipment
 - c. Hand-held motor-operated tools, stationary and fixed motor-operated tools, and light industrial motor-operated tools
 - d. Motor-operated appliances of the following types: hedge clippers, lawn mowers, snow blowers, and wet scrubbers
 - e. Portable handlamps
 - f. Cord-and-plug-connected appliances used in damp or wet locations or by persons standing on the ground or on metal floors or working inside of metal tanks or boilers
 - g. Tools likely to be used in wet or conductive locations

Exception: Tools and portable handlamps likely to be used in wet or conductive locations shall not be required to be connected to an equipment grounding conductor where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

250.116 Nonelectrical Equipment. The metal parts of the following nonelectrical equipment described in this section shall be connected to the equipment grounding conductor:

- (1) Frames and tracks of electrically operated cranes and hoists
- (2) Frames of nonelectrically driven elevator cars to which electrical conductors are attached
- (3) Hand operated metal shifting ropes or cables of electric elevators

Informational Note: Where extensive metal in or on buildings or structures may become energized and is subject to personal contact, adequate bonding and grounding will provide additional safety.

Metal siding on buildings is outside the scope of the NEC and, therefore, is not subject to the requirements for grounding and bonding. However, luminaires, signs, or receptacles installed on buildings with metal siding could cause the siding to become energized. Grounding of metal siding, while not required, does reduce the shock risk from contacting the siding.

250.118 Types of Equipment Grounding Conductors.

As a general rule, the NEC only requires one EGC, and it can be any of the types specified in this section. However, some specific requirements, such as 517.13(B), require an additional wire-type EGC regardless of the wiring method. If a wire-type EGC is installed in a metal raceway and it is not isolated per 250.96(B), the raceway is in parallel with the wire, and the combination of the metal raceway and the wire is the EGC for enclosed circuit(s).

See also

250.122 for sizing of wire-type EGCs

The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following:

- (1) A copper, aluminum, or copper-clad aluminum conductor. This conductor shall be solid or stranded; insulated, covered, or bare; and in the form of a wire or a busbar of any shape.
- (2) Rigid metal conduit.
- (3) Intermediate metal conduit.
- (4) Electrical metallic tubing.
- (5) Listed flexible metal conduit meeting all the following conditions:
 - a. The conduit is terminated in listed fittings.
 - b. The circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
 - c. The size of the conduit does not exceed metric designator 35 (trade size 1¼).
 - d. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground-fault current path does not exceed 1.8 m (6 ft).
 - e. If used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.
- (6) Listed liquidtight flexible metal conduit meeting all the following conditions:
 - a. The conduit is terminated in listed fittings.
 - b. For metric designators 12 through 16 (trade sizes ¾ through ½), the circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
 - c. For metric designators 21 through 35 (trade sizes ¾ through 1¼), the circuit conductors contained in the conduit are protected by overcurrent devices rated not more than 60 amperes and there is no flexible metal conduit, flexible metallic tubing, or liquidtight flexible metal conduit in trade sizes metric designators 12 through 16 (trade sizes ¾ through ½) in the ground-fault current path.
 - d. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground-fault current path does not exceed 1.8 m (6 ft).
 - e. If used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.
- (7) Flexible metallic tubing where the tubing is terminated in listed fittings and meeting the following conditions:
 - a. The circuit conductors contained in the tubing are protected by overcurrent devices rated at 20 amperes or less.
 - b. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground-fault current path does not exceed 1.8 m (6 ft).
- (8) Armor of Type AC cable as provided in 320.108.
- (9) The copper sheath of mineral-insulated, metal-sheathed cable Type MI.
- (10) Type MC cable that provides an effective ground-fault current path in accordance with one or more of the following:
 - a. It contains an insulated or uninsulated equipment grounding conductor in compliance with 250.118(1).
 - b. The combined metallic sheath and uninsulated equipment grounding/bonding conductor of interlocked metal tape-type MC cable that is listed and identified as an equipment grounding conductor
 - c. The metallic sheath or the combined metallic sheath and equipment grounding conductors of the smooth or corrugated tube-type MC cable that is listed and identified as an equipment grounding conductor
- (11) Cable trays as permitted in 392.10 and 392.60.
- (12) Cablebus framework as permitted in 370.60(1).
- (13) Other listed electrically continuous metal raceways and listed auxiliary gutters.
- (14) Surface metal raceways listed for grounding

Informational Note: For a definition of *Effective Ground-Fault Current Path*, see Article 100.

250.119 Identification of Equipment Grounding Conductors. Unless required elsewhere in this *Code*, equipment grounding conductors shall be permitted to be bare, covered, or insulated. Individually covered or insulated equipment grounding conductors shall have a continuous outer finish that is either green or green with one or more yellow stripes except as permitted in this section. Conductors with insulation or individual covering that is green, green with one or more yellow stripes, or otherwise identified as permitted by this section shall not be used for ungrounded or grounded circuit conductors.

Exception No. 1: Power-limited Class 2 or Class 3 cables, power-limited fire alarm cables, or communications cables containing only circuits operating at less than 50 volts where connected to equipment not required to be grounded in accordance with 250.112(I) shall be permitted to use a conductor with green insulation or green with one or more yellow stripes for other than equipment grounding purposes.

Exception No. 1 permits limited use of conductors with green-colored insulation for circuit conductors in signaling or other Class 2 or Class 3 circuits operating at less than 50 volts to ground. Many limited-energy ac

systems are not required to be grounded per 250.20(A), and per 250.112(I), equipment supplied by these circuits do not have grounding requirements.

Exception No. 2: Flexible cords having an integral insulation and jacket without an equipment grounding conductor shall be permitted to have a continuous outer finish that is green.

Informational Note: An example of a flexible cord with integral-type insulation is Type SPT-2, 2 conductor.

Exception No. 3: Conductors with green insulation shall be permitted to be used as ungrounded signal conductors where installed between the output terminations of traffic signal control and traffic signal indicating heads. Signaling circuits installed in accordance with this exception shall include an equipment grounding conductor in accordance with 250.118. Wire-type equipment grounding conductors shall be bare or have insulation or covering that is green with one or more yellow stripes.

A long-standing practice of traffic signaling equipment is to use a conductor with green insulation as the signal conductor installed between the controller and the green indicating light located in the traffic signal head.

(A) Conductors 4 AWG and Larger. Equipment grounding conductors 4 AWG and larger shall comply with 250.119(A)(1) and (A)(2).

- (1) An insulated or covered conductor 4 AWG and larger shall be permitted, at the time of installation, to be permanently identified as an equipment grounding conductor at each end and at every point where the conductor is accessible.

Exception: Conductors 4 AWG and larger shall not be required to be marked in conduit bodies that contain no splices or unused hubs.

- (2) Identification shall encircle the conductor and shall be accomplished by one of the following:
 - a. Stripping the insulation or covering from the entire exposed length
 - b. Coloring the insulation or covering green at the termination
 - c. Marking the insulation or covering with green tape or green adhesive labels at the termination

(B) Multiconductor Cable. Where the conditions of maintenance and supervision ensure that only qualified persons service the installation, one or more insulated conductors in a multiconductor cable, at the time of installation, shall be permitted to be permanently identified as equipment grounding conductors at each end and at every point where the conductors are accessible by one of the following means:

- (1) Stripping the insulation from the entire exposed length.
- (2) Coloring the exposed insulation green.
- (3) Marking the exposed insulation with green tape or green adhesive labels. Identification shall encircle the conductor.

(C) Flexible Cord. Equipment grounding conductors in flexible cords shall be insulated and shall have a continuous outer finish that is either green or green with one or more yellow stripes.

250.120 Equipment Grounding Conductor Installation. An equipment grounding conductor shall be installed in accordance with 250.120(A), (B), and (C).

(A) Raceway, Cable Trays, Cable Armor, Cablebus, or Cable Sheaths. Where it consists of a raceway, cable tray, cable armor, cablebus framework, or cable sheath or where it is a wire within a raceway or cable, it shall be installed in accordance with the applicable provisions in this Code using fittings for joints and terminations approved for use with the type raceway or cable used. All connections, joints, and fittings shall be made tight using suitable tools.

Informational Note: See the UL guide information on FHIT systems for equipment grounding conductors installed in a raceway that are part of an electrical circuit protective system or a fire-rated cable listed to maintain circuit integrity.

(B) Aluminum and Copper-Clad Aluminum Conductors. Equipment grounding conductors of bare or insulated aluminum or copper-clad aluminum shall be permitted. Bare conductors shall not come in direct contact with masonry or the earth or where subject to corrosive conditions. Aluminum or copper-clad aluminum conductors shall not be terminated within 450 mm (18 in.) of the earth.

(C) Equipment Grounding Conductors Smaller Than 6 AWG. Where not routed with circuit conductors as permitted in 250.130(C) and 250.134(B) Exception No. 2, equipment grounding conductors smaller than 6 AWG shall be protected from physical damage by an identified raceway or cable armor unless installed within hollow spaces of the framing members of buildings or structures and where not subject to physical damage.

250.121 Use of Equipment Grounding Conductors. An equipment grounding conductor shall not be used as a grounding electrode conductor.

Exception: A wire-type equipment grounding conductor installed in compliance with 250.6(A) and the applicable requirements for both the equipment grounding conductor and the grounding electrode conductor in Parts II, III, and VI of this article shall be permitted to serve as both an equipment grounding conductor and a grounding electrode conductor.

EGCs and grounding electrode conductors (GECs) have specific functions. GECs are required to be a wire- or busbar-type conductor in accordance with 250.62, whereas EGCs are permitted to be any of the types listed in 250.118. This exception permits a wire-type conductor to be used for both purposes if it satisfies all applicable requirements for both the EGC and the GEC and it does not carry current during normal operating conditions.

250.122 Size of Equipment Grounding Conductors.

(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in [Table 250.122](#), but in no case shall they be required to be larger than the circuit conductors supplying the equipment. Where a cable tray, a raceway, or a cable armor or sheath is used as the equipment grounding conductor, as provided in [250.118](#) and [250.134\(A\)](#), it shall comply with [250.4\(A\)\(5\)](#) or [\(B\)\(4\)](#).

Equipment grounding conductors shall be permitted to be sectioned within a multiconductor cable, provided the combined circular mil area complies with [Table 250.122](#).

(B) Increased in Size. Where ungrounded conductors are increased in size from the minimum size that has sufficient ampacity for the intended installation, wire-type equipment grounding conductors, where installed, shall be increased in size proportionately, according to the circular mil area of the ungrounded conductors.

Generally, the minimum-sized EGC is selected from [Table 250.122](#) based on the rating or setting of the feeder or branch-circuit OCPD(s). Where the ungrounded circuit conductors are increased in size to compensate for voltage drop, the EGCs must be increased proportionately. This will lower the overall impedance of the ground-fault current return path, which will facilitate operation of the OCPD in the event of a line-to-ground fault.

Calculation Example

A 240 V, single phase, 250 A load is supplied from a 300-A breaker located in a panelboard 500 ft away. The conductors are 250 kcmil copper, installed in rigid nonmetallic conduit, with a 4 AWG copper EGC. If the conductors are increased to 350 kcmil, what is the minimum size for the EGC based on the proportional-increase requirement?

Solution

Step 1. Calculate the size ratio of the new conductors to the existing conductors:

$$\text{Size ratio} = \frac{350,000 \text{ circular mils}}{250,000 \text{ circular mils}} = 1.4$$

Step 2. Calculate the cross-sectional area of the new EGC:

$$41,740 \text{ circular mils} \times 1.4 = 58,436 \text{ circular mils}$$

According to [Table 8](#) of [Chapter 9](#), the size of the existing grounding conductor, 4 AWG, has a cross-sectional area of 41,740 circular mils.

Step 3. Determine the size of the new EGC. Again, referring to [Chapter 9](#), [Table 8](#), we find that 58,436 circular mils is larger than 3 AWG. The next larger size is 66,360 circular mils, which converts to a 2 AWG copper EGC.

(C) Multiple Circuits. Where a single equipment grounding conductor is run with multiple circuits in the same raceway, cable, or cable tray, it shall be sized for the largest overcurrent

device protecting conductors in the raceway, cable, or cable tray. Equipment grounding conductors installed in cable trays shall meet the minimum requirements of [392.10\(B\)\(1\)\(c\)](#).

A single EGC serving multiple circuits is required to be sized based on the size of the largest circuit supplied; it is not likely that all circuits will develop faults at the same time. For example, three 3-phase circuits in the same raceway, protected by overcurrent devices rated 30, 60, and 100 amperes, would require only one EGC, sized according to the largest overcurrent device (in this case, 100 amperes). Therefore, an 8 AWG copper or 6 AWG aluminum conductor or copper-clad aluminum conductor is required, according to [Table 250.122](#).

(D) Motor Circuits. Equipment grounding conductors for motor circuits shall be sized in accordance with [\(D\)\(1\)](#) or [\(D\)\(2\)](#).

(1) General. The equipment grounding conductor size shall not be smaller than determined by [250.122\(A\)](#) based on the rating of the branch-circuit short-circuit and ground-fault protective device.

(2) Instantaneous-Trip Circuit Breaker and Motor Short-Circuit Protector. Where the overcurrent device is an instantaneous-trip circuit breaker or a motor short-circuit protector, the equipment grounding conductor shall be sized not smaller than that given by [250.122\(A\)](#) using the maximum permitted rating of a dual element time-delay fuse selected for branch-circuit short-circuit and ground-fault protection in accordance with [430.52\(C\)\(1\)](#), Exception No. 1.

(E) Flexible Cord and Fixture Wire. The equipment grounding conductor in a flexible cord with the largest circuit conductor 10 AWG or smaller, and the equipment grounding conductor used with fixture wires of any size in accordance with [240.5](#), shall not be smaller than 18 AWG copper and shall not be smaller than the circuit conductors. The equipment grounding conductor in a flexible cord with a circuit conductor larger than 10 AWG shall be sized in accordance with [Table 250.122](#).

(F) Conductors in Parallel. For circuits of parallel conductors as permitted in [310.10\(H\)](#), the equipment grounding conductor shall be installed in accordance with [\(1\)](#) or [\(2\)](#).

N (1) Conductor Installations in Raceways, Auxiliary Gutters, or Cable Trays.

(a) *Single Raceway or Cable Tray.* If conductors are installed in parallel in the same raceway or cable tray, a single wire-type conductor shall be permitted as the equipment grounding conductor. The wire-type equipment grounding conductor shall be sized in accordance with [250.122](#) based on the overcurrent protective device for the feeder or branch circuit. Wire-type equipment grounding conductors installed in cable trays shall meet the minimum requirements of [392.10\(B\)\(1\)\(c\)](#). Metal raceways or auxiliary gutters in accordance with [250.118](#) or cable trays complying with [392.60\(B\)](#) shall be permitted as the equipment grounding conductor.

(b) *Multiple Raceways.* If conductors are installed in parallel in multiple raceways, wire type equipment grounding

conductors, where used, shall be installed in parallel in each raceway. The equipment grounding conductor installed in each raceway shall be sized in compliance with 250.122 based on the overcurrent protective device for the feeder or branch circuit. Metal raceways or auxiliary gutters in accordance with 250.118 or cable trays complying with 392.60(B) shall be permitted as the equipment grounding conductor.

(2) Multiconductor Cables

(a) If multiconductor cables are installed in parallel, the equipment grounding conductor(s) in each cable shall be connected in parallel.

(b) If multiconductor cables are installed in parallel in the same raceway, auxiliary gutter, or cable tray, a single equipment grounding conductor that is sized in accordance with 250.122 shall be permitted in combination with the equipment grounding conductors provided within the multiconductor cables and shall all be connected together.

(c) Equipment grounding conductors installed in cable trays shall meet the minimum requirements of 392.10(B)(1)(c). Cable trays complying with 392.60(B), metal raceways in accordance with 250.118, or auxiliary gutters, shall be permitted as the equipment grounding conductor.

(d) Except as provided in 250.122(F)(2)(b) for raceway or cable tray installations, the equipment grounding conductor in each multiconductor cable shall be sized in accordance with 250.122 based on the overcurrent protective device for the feeder or branch circuit.

A full-sized EGC is required to prevent overloading and possible burnout of the conductor should a ground fault occur along one of the parallel branches. The installation conditions for paralleled conductors prescribed in 310.10(H) result in proportional distribution of the current-time duty among the several paralleled grounding conductors only for overcurrent conditions downstream of the paralleled set of circuit conductors.

Exhibit 250.45 shows a parallel arrangement with two nonmetallic conduits installed underground. A ground fault at the enclosure will

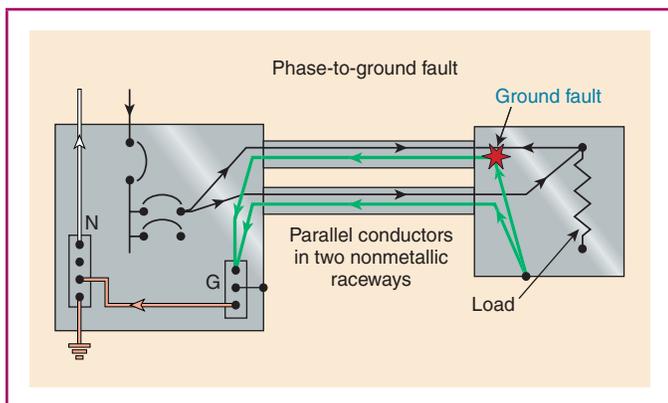

EXHIBIT 250.45 Grounding paths for ground fault at the load supplied by parallel conductors in two nonmetallic raceways, illustrating the reason for the requirement of 250.122(F).

cause the EGC in the top conduit to carry more than its proportionate share of fault current. The fault is fed by two different conductors of the same phase, one from the left and one from the right. The shortest and lowest-impedance path to ground from the fault to the supply panel-board is through the EGC in the top conduit. The grounding path from the fault through the bottom conduit is longer and of higher impedance. Therefore, the EGC in each raceway must be capable of carrying a major portion of the fault current without burning open.

Generally, if cables are used in parallel, the EGC in each cable is required to be sized in accordance with 250.122 based on the rating or setting of the OCPD that is protecting the conductors connected in parallel. The EGC may have to be larger than the ungrounded conductor in an individual cable that is used as part of a larger parallel set. The cross-sectional areas of sectioned EGCs in an individual cable are permitted by 250.122(A) to be added together to meet the requirement of a fully sized EGC in each cable. For cables that are installed in a raceway, cable tray, or auxiliary gutter, a supplementary EGC that is sized per the OCPD and Table 250.122 can be installed as an alternative to requiring that each cable contain a full-sized EGC.

(G) Feeder Taps. Equipment grounding conductors run with feeder taps shall not be smaller than shown in Table 250.122 based on the rating of the overcurrent device ahead of the feeder but shall not be required to be larger than the tap conductors.

TABLE 250.122 Minimum Size Equipment Grounding Conductors for Grounding Raceway and Equipment

Rating or Setting of Automatic Overcurrent Device in Circuit Ahead of Equipment, Conduit, etc., Not Exceeding (Amperes)	Size (AWG or kcmil)	
	Copper	Aluminum or Copper-Clad Aluminum*
15	14	12
20	12	10
60	10	8
100	8	6
200	6	4
300	4	2
400	3	1
500	2	1/0
600	1	2/0
800	1/0	3/0
1000	2/0	4/0
1200	3/0	250
1600	4/0	350
2000	250	400
2500	350	600
3000	400	600
4000	500	750
5000	700	1200
6000	800	1200

Note: Where necessary to comply with 250.4(A)(5) or (B)(4), the equipment grounding conductor shall be sized larger than given in this table.

*See installation restrictions in 250.120.

250.124 Equipment Grounding Conductor Continuity.

(A) Separable Connections. Separable connections such as those provided in drawout equipment or attachment plugs and mating connectors and receptacles shall provide for first-make, last-break of the equipment grounding conductor. First-make, last-break shall not be required where interlocked equipment, plugs, receptacles, and connectors preclude energization without grounding continuity.

(B) Switches. No automatic cutout or switch shall be placed in the equipment grounding conductor of a premises wiring system unless the opening of the cutout or switch disconnects all sources of energy.

250.126 Identification of Wiring Device Terminals. The terminal for the connection of the equipment grounding conductor shall be identified by one of the following:

- (1) A green, not readily removable terminal screw with a hexagonal head.
- (2) A green, hexagonal, not readily removable terminal nut.
- (3) A green pressure wire connector. If the terminal for the equipment grounding conductor is not visible, the conductor entrance hole shall be marked with the word *green* or *ground*, the letters *G* or *GR*, a grounding symbol, or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

Informational Note: See **Informational Note Figure 250.126**.

INFORMATIONAL NOTE FIGURE 250.126 One Example of a Symbol Used to Identify the Grounding Termination Point for an Equipment Grounding Conductor.

Part VII. Methods of Equipment Grounding

250.130 Equipment Grounding Conductor Connections.

Equipment grounding conductor connections at the source of separately derived systems shall be made in accordance with 250.30(A)(1). Equipment grounding conductor connections at service equipment shall be made as indicated in 250.130(A) or (B). For replacement of non-grounding-type receptacles with grounding-type receptacles and for branch-circuit extensions only in existing installations that do not have an equipment grounding conductor in the branch circuit, connections shall be permitted as indicated in 250.130(C).

(A) For Grounded Systems. The connection shall be made by bonding the equipment grounding conductor to the grounded service conductor and the grounding electrode conductor.

The grounding and bonding arrangement required by 250.130(A) for a grounded system is illustrated in **Exhibit 250.46**.

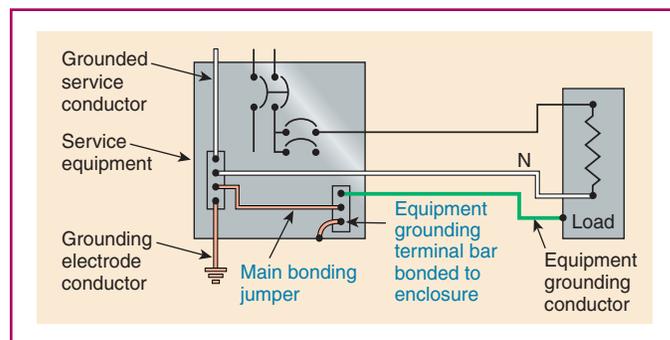

EXHIBIT 250.46 Grounding and bonding arrangement for grounded systems, per 250.130(A), illustrating connection of the EGC (bus) to the enclosures and the grounded service conductor.

(B) For Ungrounded Systems. The connection shall be made by bonding the equipment grounding conductor to the grounding electrode conductor.

(C) Nongrounding Receptacle Replacement or Branch Circuit Extensions. The equipment grounding conductor of a grounding-type receptacle or a branch-circuit extension shall be permitted to be connected to any of the following:

- (1) Any accessible point on the grounding electrode system as described in 250.50
- (2) Any accessible point on the grounding electrode conductor
- (3) The equipment grounding terminal bar within the enclosure where the branch circuit for the receptacle or branch circuit originates
- (4) An equipment grounding conductor that is part of another branch circuit that originates from the enclosure where the branch circuit for the receptacle or branch circuit originates
- (5) For grounded systems, the grounded service conductor within the service equipment enclosure
- (6) For ungrounded systems, the grounding terminal bar within the service equipment enclosure

Informational Note: See 406.4(D) for the use of a ground-fault circuit-interrupting type of receptacle.

Section 250.130(C) applies to both ungrounded and grounded systems, but its most common application is for receptacle replacement of branch-circuit extensions in single-phase, 120-volt, 15- and 20-ampere branch circuits. A non-grounding-type receptacle can be replaced with a grounding-type receptacle under the conditions of this section. This section does not permit a separate EGC to be connected to the metal water piping of a building beyond the first 5 feet because it is not considered a grounding electrode conductor or part of the electrode system.

Exhibit 250.47 shows a branch-circuit extension made from an existing installation. This method is also permitted to ground a replacement 3-wire receptacle in the existing ungrounded box on the left, where no grounding conductor is available.

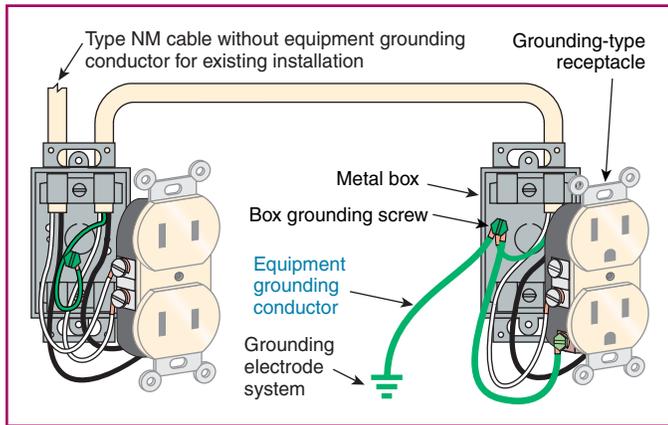

EXHIBIT 250.47 Branch-circuit extension from an existing installation, per 250.130(C), illustrating a separate EGC connected to the grounding electrode system.

250.132 Short Sections of Raceway. Isolated sections of metal raceway or cable armor, where required to be grounded, shall be connected to an equipment grounding conductor in accordance with 250.134.

250.134 Equipment Fastened in Place or Connected by Permanent Wiring Methods (Fixed) — Grounding. Unless grounded by connection to the grounded circuit conductor as permitted by 250.32, 250.140, and 250.142, non-current-carrying metal parts of equipment, raceways, and other enclosures, if grounded, shall be connected to an equipment grounding conductor by one of the methods specified in 250.134(A) or (B).

(A) Equipment Grounding Conductor Types. By connecting to any of the equipment grounding conductors permitted by 250.118.

(B) With Circuit Conductors. By connecting to an equipment grounding conductor contained within the same raceway, cable, or otherwise run with the circuit conductors.

The EGC run in the same raceway or cable as the circuit conductor(s) allows the magnetic field developed by the circuit conductor and the EGC to cancel, reducing their impedance.

Magnetic flux strength is inversely proportional to the square of the distance between the two conductors. By placing an EGC away from the conductor delivering the fault current, the magnetic flux cancellation decreases. This increases the impedance of the fault path and delays operation of the protective device contrary to the performance requirements specified in 250.4(A)(5) and (B)(4) for the ground-fault current return path.

Exception No. 1: As provided in 250.130(C), the equipment grounding conductor shall be permitted to be run separately from the circuit conductors.

Exception No. 2: For dc circuits, the equipment grounding conductor shall be permitted to be run separately from the circuit conductors.

Informational Note No. 1: See 250.102 and 250.168 for equipment bonding jumper requirements.

Informational Note No. 2: See 400.10 for use of cords for fixed equipment.

250.136 Equipment Considered Grounded. Under the conditions specified in 250.136(A) and (B), the normally non-current-carrying metal parts of the equipment shall be considered grounded.

(A) Equipment Secured to Grounded Metal Supports. Electrical equipment secured to and in electrical contact with a metal rack or structure provided for its support and connected to an equipment grounding conductor by one of the means indicated in 250.134. The structural metal frame of a building shall not be used as the required equipment grounding conductor for ac equipment.

Equipment bolted or securely clamped to the rack will typically provide the necessary electrical contact to ensure a low impedance connection between the rack and the equipment. If the rack has been painted, 250.12 requires the paint to be removed to ensure good electrical continuity.

Exhibit 250.48 is an example of electrical equipment secured to and in electrical contact with a metal rack. It is effectively grounded by the equipment bonding jumper installed between the safety switch and the rack. The physical separation between the circuit conductors and the building steel raises the impedance of the equipment grounding and bonding path and is not permitted by 250.134(B) and 300.3(B).

(B) Metal Car Frames. Metal car frames supported by metal hoisting cables attached to or running over metal sheaves or drums of elevator machines that are connected to an equipment grounding conductor by one of the methods indicated in 250.134.

250.138 Cord-and-Plug-Connected Equipment. Non-current-carrying metal parts of cord-and-plug-connected equipment, if grounded, shall be connected to an equipment grounding conductor by one of the methods in 250.138(A) or (B).

(A) By Means of an Equipment Grounding Conductor. By means of an equipment grounding conductor run with the power

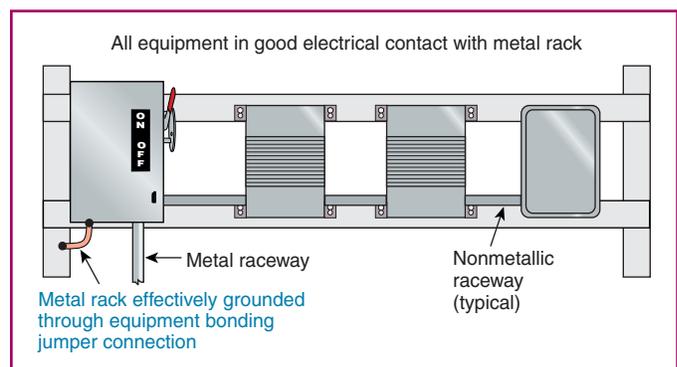

EXHIBIT 250.48 Mounting equipment to a grounded support structure or rack is an acceptable means of providing the required equipment grounding connection.

supply conductors in a cable assembly or flexible cord properly terminated in a grounding-type attachment plug with one fixed grounding contact.

Exception: The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between any two conductors or over 150 volts between any conductor and ground.

(B) By Means of a Separate Flexible Wire or Strap. By means of a separate flexible wire or strap, insulated or bare, connected to an equipment grounding conductor, and protected as well as practicable against physical damage, where part of equipment.

250.140 Frames of Ranges and Clothes Dryers. Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and outlet or junction boxes that are part of the circuit for these appliances shall be connected to the equipment grounding conductor in the manner specified by 250.134 or 250.138.

Exception: For existing branch-circuit installations only where an equipment grounding conductor is not present in the outlet or junction box, the frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and outlet or junction boxes that are part of the circuit for these appliances shall be permitted to be connected to the grounded circuit conductor if all the following conditions are met.

- (1) The supply circuit is 120/240-volt, single-phase, 3-wire; or 208Y/120-volt derived from a 3-phase, 4-wire, wye-connected system.
- (2) The grounded conductor is not smaller than 10 AWG copper or 8 AWG aluminum.
- (3) The grounded conductor is insulated, or the grounded conductor is uninsulated and part of a Type SE service-entrance cable and the branch circuit originates at the service equipment.
- (4) Grounding contacts of receptacles furnished as part of the equipment are bonded to the equipment.

Prior to the 1996 edition of the NEC, use of the grounded circuit conductor as a grounding conductor was permitted for range installations. In many instances, the wiring method was service-entrance cable with an uninsulated neutral conductor covered by the cable jacket. Where Type SE cable was used to supply ranges and dryers, the branch circuit was required to originate at the service equipment to avoid neutral current from downstream panelboards being imposed on metal objects, such as pipes or ducts. The grounded conductor (neutral) of newly installed branch circuits supplying ranges and clothes dryers is not permitted to be used for grounding the non-current-carrying metal parts of the appliances. Branch circuits for new appliance installations are required to provide an EGC sized in accordance with 250.122 for grounding the non-current-carrying metal parts.

An older appliance connected to a new branch circuit must have its 3-wire cord and plug replaced with a 4-conductor cord, with one of

those conductors being an EGC. The appliance bonding jumper between the neutral and the frame of the appliance must be removed. Where a new range or clothes dryer is connected to an existing branch circuit without an EGC, an appliance bonding jumper must be connected between the neutral terminal and the frame of the appliance.

The grounded circuit conductor of an existing branch circuit is permitted to be used to ground the frame of an electric range, wall-mounted oven, or counter-mounted cooking unit, provided all four conditions of 250.140, Exception, are met. In addition, the grounded circuit conductor of these existing branch circuits is also permitted to be used to ground any junction boxes in the circuit supplying the appliance, and a 3-wire pigtail and range receptacle are permitted to be used.

250.142 Use of Grounded Circuit Conductor for Grounding Equipment.

(A) Supply-Side Equipment. A grounded circuit conductor shall be permitted to ground non-current-carrying metal parts of equipment, raceways, and other enclosures at any of the following locations:

- (1) On the supply side or within the enclosure of the ac service-disconnecting means
- (2) On the supply side or within the enclosure of the main disconnecting means for separate buildings as provided in 250.32(B)
- (3) On the supply side or within the enclosure of the main disconnecting means or overcurrent devices of a separately derived system where permitted by 250.30(A)(1)

(B) Load-Side Equipment. Except as permitted in 250.30(A)(1) and 250.32(B) Exception, a grounded circuit conductor shall not be used for grounding non-current carrying metal parts of equipment on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means or the overcurrent devices for a separately derived system not having a main disconnecting means.

Exception No. 1: The frames of ranges, wall-mounted ovens, counter-mounted cooking units, and clothes dryers under the conditions permitted for existing installations by 250.140 shall be permitted to be connected to the grounded circuit conductor.

Exception No. 2: It shall be permissible to ground meter enclosures by connection to the grounded circuit conductor on the load side of the service disconnect where all of the following conditions apply:

- (1) No service ground-fault protection is installed.
- (2) All meter enclosures are located immediately adjacent to the service disconnecting means.
- (3) The size of the grounded circuit conductor is not smaller than the size specified in Table 250.122 for equipment grounding conductors.

Exception No. 3: Direct-current systems shall be permitted to be grounded on the load side of the disconnecting means or overcurrent device in accordance with 250.164.

Exception No. 4: Electrode-type boilers operating at over 1000 volts shall be grounded as required in 490.72(E)(1) and 490.74.

If the grounded circuit conductor is re-grounded on the load side of the service and the grounded conductor is disconnected at any point on the line side of the service, the EGC and all conductive parts connected to it would become energized. Under this condition, the potential to ground of any exposed metal parts could be raised to line voltage. This rise in potential on non-current-carrying conductive parts could result in arcing in concealed spaces and could pose a severe shock hazard, particularly if contact is made with metal piping or ductwork.

Even without an open grounded conductor, a connection between the grounded conductor and the EGC on the load side of the service places the EGC in a parallel circuit path with the grounded conductor. Exposed and concealed non-current-carrying metal parts could also be hazardous.

See also

250.30 and **250.32(B)**, which prohibit the creation of parallel paths for normal neutral current

250.144 Multiple Circuit Connections. Where equipment is grounded and is supplied by separate connection to more than one circuit or grounded premises wiring system, an equipment grounding conductor termination shall be provided for each such connection as specified in **250.134** and **250.138**.

250.146 Connecting Receptacle Grounding Terminal to Box. An equipment bonding jumper shall be used to connect the grounding terminal of a grounding-type receptacle to a grounded box unless grounded as in **250.146(A)** through (D). The equipment bonding jumper shall be sized in accordance with **Table 250.122** based on the rating of the overcurrent device protecting the circuit conductors.

(A) Surface-Mounted Box. Where the box is mounted on the surface, direct metal-to-metal contact between the device yoke and the box or a contact yoke or device that complies with **250.146(B)** shall be permitted to ground the receptacle to the box. At least one of the insulating washers shall be removed from receptacles that do not have a contact yoke or device that complies with **250.146(B)** to ensure direct metal-to-metal contact. This provision shall not apply to cover-mounted receptacles unless the box and cover combination are listed as providing satisfactory ground continuity between the box and the receptacle. A listed exposed work cover shall be permitted to be the grounding and bonding means when (1) the device is attached to the cover with at least two fasteners that are permanent (such as a rivet) or have a thread locking or screw or nut locking means and (2) when the cover mounting holes are located on a flat non-raised portion of the cover.

Section 250.146(A) permits the equipment bonding jumper to be omitted where the metal yoke of the device is in direct metal-to-metal contact with the metal device box and at least one of the fiber retention washers for the receptacle mounting screws is removed, as illustrated in **Exhibit 250.49**.

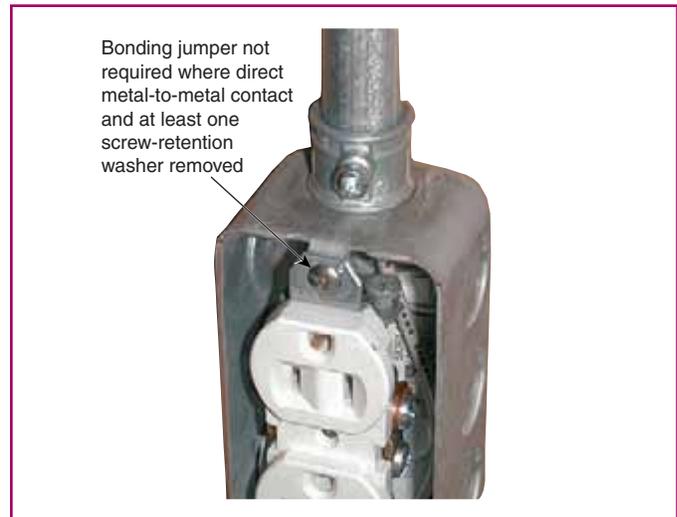

EXHIBIT 250.49 An example of a box-mounted receptacle attached to a surface box where a bonding jumper from the grounded metal box to the receptacle is not required provided at least one of the insulating washers is removed.

EXHIBIT 250.50 An example of a cover-mounted receptacle attached to a surface box where a bonding jumper from the grounded metal box to the receptacle is not required.

Box-cover and device combinations listed as providing grounding continuity are permitted, as illustrated in **Exhibit 250.50**. The mounting holes for the cover must be located on a flat, non-raised portion of the cover to provide the best possible surface-to-surface contact, and the receptacle must be secured to the cover using not less than two rivets or locking means for threaded attachment means.

(B) Contact Devices or Yokes. Contact devices or yokes designed and listed as self-grounding shall be permitted in conjunction with the supporting screws to establish equipment bonding between the device yoke and flush-type boxes.

Exhibit 250.51 shows a receptacle designed with a spring-type grounding strap for holding the mounting screw and establishing the grounding

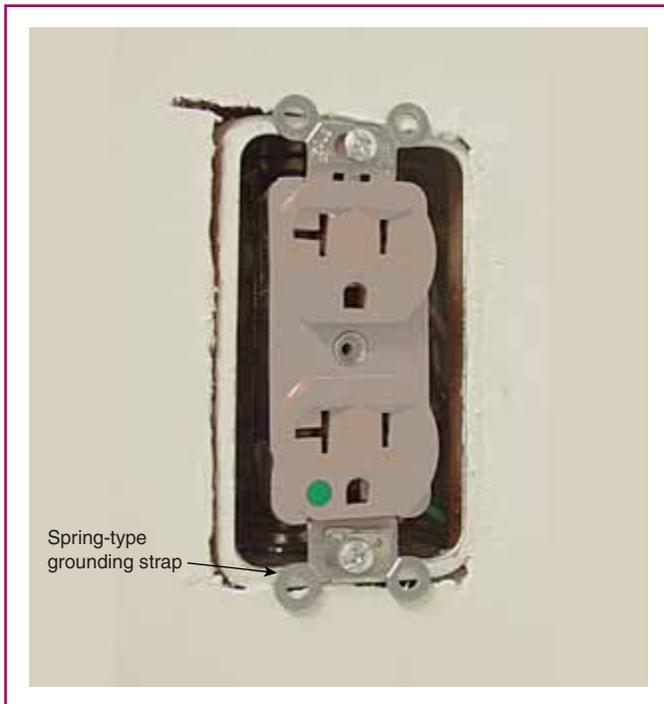

EXHIBIT 250.51 A receptacle designed with a listed spring-type grounding strap. The clip holding the bottom mounting screw captive establishes a grounding connection and eliminates the need to provide a wire-type equipment bonding jumper from the grounded metal box to the receptacle.

connection so that an equipment bonding jumper is not required. Such devices are listed as “self-grounding” and are permitted to be used for bonding the flush-mounted receptacle to a grounded metal box.

(C) Floor Boxes. Floor boxes designed for and listed as providing satisfactory ground continuity between the box and the device shall be permitted.

(D) Isolated Ground Receptacles. Where installed for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be connected to an insulated equipment grounding conductor run with the circuit conductors. This equipment grounding conductor shall be permitted to pass through one or more panelboards without a connection to the panelboard grounding terminal bar as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service. Where installed in accordance with the provisions of this section, this equipment grounding conductor shall also be permitted to pass through boxes, wireways, or other enclosures without being connected to such enclosures.

Informational Note: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.

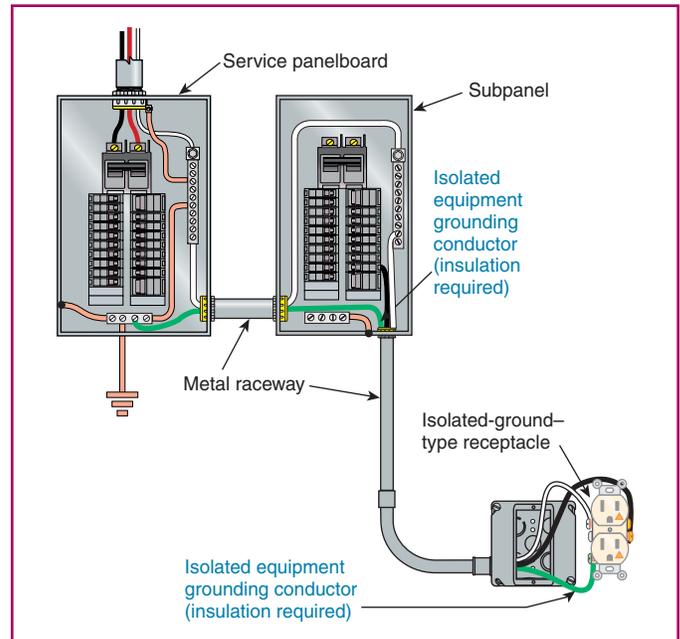

EXHIBIT 250.52 An isolated-ground-type receptacle with an insulated EGC and the device box grounded through the metal raceway.

An isolated-ground-type receptacle is permitted to be installed without a bonding jumper between the metal device box and the receptacle grounding terminal. However, the isolated EGC must provide an effective path for ground-fault current between the receptacle grounding terminal and the source of the branch circuit supplying the receptacle. An insulated EGC, as shown in Exhibit 250.52, is installed with the branch-circuit conductors. This conductor may originate in the service panel, pass through any number of subpanels without being connected to the equipment grounding bus, and terminate at the isolated-ground-type receptacle ground terminal. Termination of the isolated EGC at the service is not necessary. It may be terminated at any of the intervening panelboards. The objective is to terminate it where the noise is eliminated.

This isolated EGC arrangement does not exempt the metal device box from being grounded. The metal device box must be grounded either by an EGC run with the circuit conductors or by a wiring method that serves as an EGC.

According to 250.146(D), where isolated-ground-type receptacles are used, the isolated EGC can terminate at an equipment grounding terminal of the applicable service or derived system in the same building as the receptacle. If the isolated EGC terminates at a separate building, a large voltage difference may exist between buildings during lightning transients. Such transients could cause damage to equipment connected to an isolated-ground-type receptacle and present a shock hazard between the isolated equipment frame and other grounded surfaces.

250.148 Continuity and Attachment of Equipment Grounding Conductors to Boxes. If circuit conductors are spliced within a box or terminated on equipment within or supported by a box, all equipment grounding conductor(s) associated with any of those circuit conductors shall be connected within the box or to the box with devices suitable for the use in accordance with 250.8 and 250.148(A) through (E).

If multiple circuits are spliced within the box or terminated to equipment within the box, all of the EGCs associated with those circuits must be connected to the box. If a metal box is grounded by a metal raceway system and the circuit conductors are not spliced or terminated to equipment in the metal box, the wire-type EGC is not required to be connected to the box.

Exception: The equipment grounding conductor permitted in 250.146(D) shall not be required to be connected to the other equipment grounding conductors or to the box.

(A) Connections. Connections and splices shall be made in accordance with 110.14(B) except that insulation shall not be required.

(B) Grounding Continuity. The arrangement of grounding connections shall be such that the disconnection or the removal of a receptacle, luminaire, or other device fed from the box does not interfere with or interrupt the grounding continuity.

(C) Metal Boxes. A connection shall be made between the one or more equipment grounding conductors and a metal box by means of a grounding screw that shall be used for no other purpose, equipment listed for grounding, or a listed grounding device.

(D) Nonmetallic Boxes. One or more equipment grounding conductors brought into a nonmetallic outlet box shall be arranged such that a connection can be made to any fitting or device in that box requiring grounding.

(E) Solder. Connections depending solely on solder shall not be used

Part VIII. Direct-Current Systems

250.160 General. Direct-current systems shall comply with Part VIII and other sections of Article 250 not specifically intended for ac systems.

250.162 Direct-Current Circuits and Systems to Be Grounded. Direct-current circuits and systems shall be grounded as provided for in 250.162(A) and (B).

(A) Two-Wire, Direct-Current Systems. A 2-wire, dc system supplying premises wiring and operating at greater than 60 volts but not greater than 300 volts shall be grounded.

Exception No. 1: A system equipped with a ground detector and supplying only industrial equipment in limited areas shall not be required to be grounded where installed adjacent to or integral with the source of supply.

Exception No. 2: A rectifier-derived dc system supplied from an ac system complying with 250.20 shall not be required to be grounded.

Exception No. 3: Direct-current fire alarm circuits having a maximum current of 0.030 ampere as specified in Article 760, Part III, shall not be required to be grounded.

(B) Three-Wire, Direct-Current Systems. The neutral conductor of all 3-wire, dc systems supplying premises wiring shall be grounded.

250.164 Point of Connection for Direct-Current Systems.

(A) Off-Premises Source. Direct-current systems to be grounded and supplied from an off-premises source shall have the grounding connection made at one or more supply stations. A grounding connection shall not be made at individual services or at any point on the premises wiring.

(B) On-Premises Source. Where the dc system source is located on the premises, a grounding connection shall be made at one of the following:

- (1) The source
- (2) The first system disconnection means or overcurrent device
- (3) By other means that accomplish equivalent system protection and that utilize equipment listed and identified for the use

250.166 Size of the Direct-Current Grounding Electrode Conductor.

The size of the grounding electrode conductor for a dc system shall be as specified in 250.166(A) and (B), except as permitted by 250.166(C) through (E). The grounding electrode conductor for a dc system shall meet the sizing requirements in this section but shall not be required to be larger than 3/0 copper or 250 kcmil aluminum.

(A) Not Smaller Than the Neutral Conductor. Where the dc system consists of a 3-wire balancer set or a balancer winding with overcurrent protection as provided in 445.12(D), the grounding electrode conductor shall not be smaller than the neutral conductor and not smaller than 8 AWG copper or 6 AWG aluminum.

(B) Not Smaller Than the Largest Conductor. Where the dc system is other than as in 250.166(A), the grounding electrode conductor shall not be smaller than the largest conductor supplied by the system, and not smaller than 8 AWG copper or 6 AWG aluminum.

(C) Connected to Rod, Pipe, or Plate Electrodes. Where connected to rod, pipe, or plate electrodes as in 250.52(A)(5) or (A)(7), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than 6 AWG copper wire or 4 AWG aluminum wire.

(D) Connected to a Concrete-Encased Electrode. Where connected to a concrete-encased electrode as in 250.52(A)(3), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than 4 AWG copper wire.

(E) Connected to a Ground Ring. Where connected to a ground ring as in 250.52(A)(4), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than the conductor used for the ground ring.

250.167 Direct-Current Ground-Fault Detection.

(A) Ungrounded Systems. Ground-fault detection systems shall be required for ungrounded systems.

(B) Grounded Systems. Ground-fault detection shall be permitted for grounded systems.

(C) Marking. Direct-current systems shall be legibly marked to indicate the grounding type at the dc source or the first disconnecting means of the system. The marking shall be of sufficient durability to withstand the environment involved.

Informational Note: *NFPA 70E-2015* identifies four dc grounding types in detail.

250.168 Direct-Current System Bonding Jumper. For direct-current systems that are to be grounded, an unspliced bonding jumper shall be used to connect the equipment grounding conductor(s) to the grounded conductor at the source or the first system disconnecting means where the system is grounded. The size of the bonding jumper shall not be smaller than the system grounding electrode conductor specified in 250.166 and shall comply with the provisions of 250.28(A), (B), and (C).

250.169 Ungrounded Direct-Current Separately Derived Systems. Except as otherwise permitted in 250.34 for portable and vehicle-mounted generators, an ungrounded dc separately derived system supplied from a stand-alone power source (such as an engine-generator set) shall have a grounding electrode conductor connected to an electrode that complies with Part III of this article to provide for grounding of metal enclosures, raceways, cables, and exposed non-current-carrying metal parts of equipment. The grounding electrode conductor connection shall be to the metal enclosure at any point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices.

The size of the grounding electrode conductor shall be in accordance with 250.166.

Part IX. Instruments, Meters, and Relays

250.170 Instrument Transformer Circuits. Secondary circuits of current and potential instrument transformers shall be grounded where the primary windings are connected to circuits of 300 volts or more to ground and, where installed on or in switchgear and on switchboards, shall be grounded irrespective of voltage.

Exception No. 1: Circuits where the primary windings are connected to circuits of 1000 volts or less with no live parts or wiring exposed or accessible to other than qualified persons.

Exception No. 2: Current transformer secondaries connected in a three-phase delta configuration shall not be required to be grounded.

250.172 Instrument Transformer Cases. Cases or frames of instrument transformers shall be connected to the equipment grounding conductor where accessible to other than qualified persons.

Exception: Cases or frames of current transformers, the primaries of which are not over 150 volts to ground and that are used exclusively to supply current to meters.

250.174 Cases of Instruments, Meters, and Relays Operating at 1000 Volts or Less. Instruments, meters, and relays operating with windings or working parts at 1000 volts or less shall be connected to the equipment grounding conductor as specified in 250.174(A), (B), or (C).

(A) Not on Switchgear or Switchboards. Instruments, meters, and relays not located on switchgear or switchboards operating with windings or working parts at 300 volts or more to ground, and accessible to other than qualified persons, shall have the cases and other exposed metal parts connected to the equipment grounding conductor.

(B) On Switchgear or Dead-Front Switchboards. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchgear or switchboards having no live parts on the front of the panels shall have the cases connected to the equipment grounding conductor.

(C) On Live-Front Switchboards. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchboards having exposed live parts on the front of panels shall not have their cases connected to the equipment grounding conductor. Mats of insulating rubber or other suitable floor insulation shall be provided for the operator where the voltage to ground exceeds 150.

250.176 Cases of Instruments, Meters, and Relays—Operating at 1000 Volts and Over. Where instruments, meters, and relays have current-carrying parts of 1000 volts and over to ground, they shall be isolated by elevation or protected by suitable barriers, grounded metal, or insulating covers or guards. Their cases shall not be connected to the equipment grounding conductor.

Exception: Cases of electrostatic ground detectors where the internal ground segments of the instrument are connected to the instrument case and grounded and the ground detector is isolated by elevation.

250.178 Instrument Equipment Grounding Conductor. The equipment grounding conductor for secondary circuits of instrument transformers and for instrument cases shall not be smaller than 12 AWG copper or 10 AWG aluminum. Cases of instrument transformers, instruments, meters, and relays that are mounted directly on grounded metal surfaces of enclosures or grounded metal of switchgear or switchboard panels shall be considered to be grounded, and no additional equipment grounding conductor shall be required.

Part X. Grounding of Systems and Circuits of over 1000 Volts

250.180 General. Where systems over 1000 volts are grounded, they shall comply with all applicable provisions of the preceding sections of this article and with 250.182 through 250.194, which supplement and modify the preceding sections.

As a general rule, Tables 250.66 (for sizing grounding electrode conductors) and 250.122 (for sizing EGCs) apply to systems operating over 1 kilovolt; however, special requirements are in Part X for EGCs for electrical systems utilizing shielded solid dielectric insulated cables rated 2001 to 35,000 volts. These electrical systems are commonly referred to as medium- and high-voltage systems.

250.182 Derived Neutral Systems. A system neutral point derived from a grounding transformer shall be permitted to be used for grounding systems over 1 kV.

250.184 Solidly Grounded Neutral Systems. Solidly grounded neutral systems shall be permitted to be either single point grounded or multigrounded neutral.

(A) Neutral Conductor.

(1) Insulation Level. The minimum insulation level for neutral conductors of solidly grounded systems shall be 600 volts.

Exception No. 1: Bare copper conductors shall be permitted to be used for the neutral conductor of the following:

- (1) Service-entrance conductors
- (2) Service laterals or underground service conductors
- (3) Direct-buried portions of feeders

Exception No. 2: Bare conductors shall be permitted for the neutral conductor of overhead portions installed outdoors.

Exception No. 3: The grounded neutral conductor shall be permitted to be a bare conductor if isolated from phase conductors and protected from physical damage.

Informational Note: See 225.4 for conductor covering where within 3.0 m (10 ft) of any building or other structure.

(2) Ampacity. The neutral conductor shall be of sufficient ampacity for the load imposed on the conductor but not less than 33½ percent of the ampacity of the phase conductors.

Exception: In industrial and commercial premises under engineering supervision, it shall be permissible to size the ampacity of the neutral conductor to not less than 20 percent of the ampacity of the phase conductor.

(B) Single-Point Grounded Neutral System. Where a single-point grounded neutral system is used, the following shall apply:

- (1) A single-point grounded neutral system shall be permitted to be supplied from (a) or (b):
 - a. A separately derived system

- b. A multigrounded neutral system with an equipment grounding conductor connected to the multigrounded neutral conductor at the source of the single-point grounded neutral system

- (2) A grounding electrode shall be provided for the system.
- (3) A grounding electrode conductor shall connect the grounding electrode to the system neutral conductor.
- (4) A bonding jumper shall connect the equipment grounding conductor to the grounding electrode conductor.
- (5) An equipment grounding conductor shall be provided to each building, structure, and equipment enclosure.
- (6) A neutral conductor shall only be required where phase-to-neutral loads are supplied.
- (7) The neutral conductor, where provided, shall be insulated and isolated from earth except at one location.
- (8) An equipment grounding conductor shall be run with the phase conductors and shall comply with (a), (b), and (c):
 - a. Shall not carry continuous load
 - b. May be bare or insulated
 - c. Shall have sufficient ampacity for fault current duty

Circuits supplied from a single-point grounded system are required to have an EGC run with the circuit conductors. This conductor is not to be used as a conductor for continuous line-to-neutral loads.

(C) Multigrounded Neutral Systems. Where a multigrounded neutral system is used, the following shall apply:

- (1) The neutral conductor of a solidly grounded neutral system shall be permitted to be grounded at more than one point. Grounding shall be permitted at one or more of the following locations:
 - a. Transformers supplying conductors to a building or other structure
 - b. Underground circuits where the neutral conductor is exposed
 - c. Overhead circuits installed outdoors
- (2) The multigrounded neutral conductor shall be grounded at each transformer and at other additional locations by connection to a grounding electrode.
- (3) At least one grounding electrode shall be installed and connected to the multigrounded neutral conductor every 400 m (1300 ft).
- (4) The maximum distance between any two adjacent electrodes shall not be more than 400 m (1300 ft).
- (5) In a multigrounded shielded cable system, the shielding shall be grounded at each cable joint that is exposed to personnel contact.

250.186 Grounding Service-Supplied Alternating-Current Systems.

(A) Systems with a Grounded Conductor at the Service Point. Where an ac system is grounded at any point and is provided with a grounded conductor at the service point, a grounded

conductor(s) shall be installed and routed with the ungrounded conductors to each service disconnecting means and shall be connected to each disconnecting means grounded conductor(s) terminal or bus. A main bonding jumper shall connect the grounded conductor(s) to each service disconnecting means's enclosure. The grounded conductor(s) shall be installed in accordance with 250.186(A)(1) through (A)(4). The size of the solidly grounded circuit conductor(s) shall be the larger of that determined by 250.184 or 250.186(A)(1) or (A)(2).

Exception: Where two or more service disconnecting means are located in a single assembly listed for use as service equipment, it shall be permitted to connect the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus. The assembly shall include a main bonding jumper for connecting the grounded conductor(s) to the assembly enclosure.

(1) Sizing for a Single Raceway or Overhead Conductor. The grounded conductor shall not be smaller than the required grounding electrode conductor specified in Table 250.102(C)(1) but shall not be required to be larger than the largest ungrounded service-entrance conductor(s).

(2) Parallel Conductors in Two or More Raceways or Overhead Conductors. If the ungrounded service-entrance conductors are installed in parallel in two or more raceways or as overhead parallel conductors, the grounded conductors shall also be installed in parallel. The size of the grounded conductor in each raceway or overhead shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or overhead, as indicated in 250.186(A)(1), but not smaller than 1/0 AWG.

Informational Note: See 310.10(H) for grounded conductors connected in parallel.

(3) Delta-Connected Service. The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.

(4) Impedance Grounded Neutral Systems. Impedance grounded neutral systems shall be installed in accordance with 250.187.

(B) Systems Without a Grounded Conductor at the Service Point. Where an ac system is grounded at any point and is not provided with a grounded conductor at the service point, a supply-side bonding jumper shall be installed and routed with the ungrounded conductors to each service disconnecting means and shall be connected to each disconnecting means equipment grounding conductor terminal or bus. The supply-side bonding jumper shall be installed in accordance with 250.186(B)(1) through (B)(3).

Exception: Where two or more service disconnecting means are located in a single assembly listed for use as service equipment, it shall be permitted to connect the supply-side bonding jumper to the assembly common equipment grounding terminal or bus.

(1) Sizing for a Single Raceway or Overhead Conductor. The supply-side bonding jumper shall not be smaller than the required grounding electrode conductor specified in Table 250.102(C)(1) but shall not be required to be larger than the largest ungrounded service-entrance conductor(s).

(2) Parallel Conductors in Two or More Raceways or Overhead Conductors. If the ungrounded service-entrance conductors are installed in parallel in two or more raceways or overhead conductors, the supply-side bonding jumper shall also be installed in parallel. The size of the supply-side bonding jumper in each raceway or overhead shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or overhead, as indicated in 250.186(A)(1), but not smaller than 1/0 AWG.

(3) Impedance Grounded Neutral Systems. Impedance grounded neutral systems shall be installed in accordance with 250.187.

250.187 Impedance Grounded Neutral Systems. Impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current shall be permitted where all of the following conditions are met:

- (1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.
- (2) Ground detectors are installed on the system.
- (3) Line-to-neutral loads are not served.

Impedance grounded neutral systems shall comply with the provisions of 250.187(A) through (D).

(A) Location. The grounding impedance shall be inserted in the grounding electrode conductor between the grounding electrode of the supply system and the neutral point of the supply transformer or generator.

(B) Identified and Insulated. The neutral conductor shall comply with both of the following:

- (1) The neutral conductor shall be identified.
- (2) The neutral conductor shall be insulated for the maximum neutral voltage.

Informational Note: The maximum neutral voltage in a three-phase wye system is 57.7 percent of the phase-to-phase voltage.

(C) System Neutral Conductor Connection. The system neutral conductor shall not be connected to ground, except through the neutral grounding impedance.

(D) Equipment Grounding Conductors. Equipment grounding conductors shall be permitted to be bare and shall be electrically connected to the ground bus and grounding electrode conductor.

250.188 Grounding of Systems Supplying Portable or Mobile Equipment. Systems supplying portable or mobile equipment over 1000 volts, other than substations installed on a temporary basis, shall comply with 250.188(A) through (F).

(A) Portable or Mobile Equipment. Portable or mobile equipment over 1000 volts shall be supplied from a system having its neutral conductor grounded through an impedance. Where a delta-connected system over 1000 volts is used to supply portable or mobile equipment, a system neutral point and associated neutral conductor shall be derived.

“Portable” describes equipment that is easily carried from one location to another. “Mobile” describes equipment that is easily moved on wheels, treads, skids, or similar means.

(B) Exposed Non–Current-Carrying Metal Parts. Exposed non–current-carrying metal parts of portable or mobile equipment shall be connected by an equipment grounding conductor to the point at which the system neutral impedance is grounded.

(C) Ground-Fault Current. The voltage developed between the portable or mobile equipment frame and ground by the flow of maximum ground-fault current shall not exceed 100 volts.

(D) Ground-Fault Detection and Relaying. Ground-fault detection and relaying shall be provided to automatically de-energize any component of a system over 1000 volts that has developed a ground fault. The continuity of the equipment grounding conductor shall be continuously monitored so as to automatically de-energize the circuit of the system over 1000 volts to the portable or mobile equipment upon loss of continuity of the equipment grounding conductor.

(E) Isolation. The grounding electrode to which the portable or mobile equipment system neutral impedance is connected shall be isolated from and separated in the ground by at least 60 m (20 ft) from any other system or equipment grounding electrode, and there shall be no direct connection between the grounding electrodes, such as buried pipe and fence, and so forth.

(F) Trailing Cable and Couplers. Trailing cable and couplers of systems over 1000 volts for interconnection of portable or mobile equipment shall meet the requirements of **Part III** of **Article 400** for cables and **490.55** for couplers.

250.190 Grounding of Equipment.

(A) Equipment Grounding. All non–current-carrying metal parts of fixed, portable, and mobile equipment and associated fences, housings, enclosures, and supporting structures shall be grounded.

Exception: Where isolated from ground and located such that any person in contact with ground cannot contact such metal parts when the equipment is energized, the metal parts shall not be required to be grounded.

Informational Note: See **250.110**, Exception No. 2, for pole-mounted distribution apparatus.

(B) Grounding Electrode Conductor. If a grounding electrode conductor connects non–current-carrying metal parts to ground, the grounding electrode conductor shall be sized in accordance with **Table 250.66**, based on the size of the largest ungrounded service, feeder, or branch-circuit conductors supplying the equipment. The grounding electrode conductor shall not be smaller than 6 AWG copper or 4 AWG aluminum.

(C) Equipment Grounding Conductor. Equipment grounding conductors shall comply with **250.190(C)(1)** through **(C)(3)**.

(1) General. Equipment grounding conductors that are not an integral part of a cable assembly shall not be smaller than 6 AWG copper or 4 AWG aluminum.

(2) Shielded Cables. The metallic insulation shield encircling the current carrying conductors shall be permitted to be used as an equipment grounding conductor, if it is rated for clearing time of ground-fault current protective device operation without damaging the metallic shield. The metallic tape insulation shield and drain wire insulation shield shall not be used as an equipment grounding conductor for solidly grounded systems.

Shields comprised of copper tape and drain wires cannot be used as the EGC in solidly grounded systems. The use of shielded cables is specified in **310.10(E)**. These requirements are based on the system voltage, installation conditions, and cable construction. As explained in the informational note to **310.10(E)**, the cable shield provides several different functions, including grounding and bonding.

Exhibit 250.53 shows three different types of single-conductor shielded cable construction. Shielded cables are also available in multi-conductor configurations such as Type MV (**Article 328**) or Type MC (**Article 330**) cables. Where the ground-fault current is relatively low (as in impedance grounded neutral systems), the metallic shield of any of the cable types pictured in **Exhibit 250.53** is permitted to serve as the EGC if

EXHIBIT 250.53 Three examples of single-conductor shielded cable, each having a different type of shielding. (Courtesy of Chuck Mello)

it is rated for clearing time of ground-fault current without being damaged. Cable manufacturers can provide permissible short-circuit currents for a metallic shield based on fault clearing time of the OCPD.

Where the system is solidly grounded, neither the metallic tape insulation shield (top cable in [Exhibit 250.53](#)) nor the drain wire insulation shield (middle cable) can be used as the EGC, because they do not have sufficient circular mil area to provide the effective ground-fault return path required by [250.4\(A\)\(5\)](#). A metallic insulation shield encircling the conductor (bottom cable), commonly called concentric neutral cable, has larger conductor strands in the concentric wrap. Because of its larger overall circular mil area, this concentric neutral cable is permitted to be used as an EGC in a solidly grounded system if the metallic shield will not be damaged during the time it takes to open the circuit OCPD. The copper metallic tape is typically 5 mils thick and is helically applied with a 12.5 percent or larger overlap over the insulation shield. Drain wires are typically 24 AWG bare copper wires.

Where the cable shield cannot carry ground-fault current without damage, a separate EGC must be installed. A separate EGC would also be required where tape or drain-wire-type shields are not permitted to carry fault current. The EGC can be integral to a cable assembly, can be run as a separate conductor in a raceway or cable tray, or can be a wiring method-type EGC of one of the types specified in [250.118](#), such as rigid metal conduit or intermediate metal conduit. Wire-type EGCs are sized in accordance with [250.122](#).

See also

[250.190\(C\)\(3\)](#), Informational Note, for more information on how the rating of OCPDs used in systems operating over 1000 volts is determined

(3) Sizing. Equipment grounding conductors shall be sized in accordance with [Table 250.122](#) based on the current rating of the fuse or the overcurrent setting of the protective relay

Informational Note: The overcurrent rating for a circuit breaker is the combination of the current transformer ratio and the current pickup setting of the protective relay.

This requirement applies to EGCs that are separately installed as specified in [250.190\(C\)\(1\)](#). It also applies to a conductor installed in a cable assembly, other than the cable shield, that is used as an EGC. An EGC contained within a cable assembly may be a single conductor, or it may be sectioned (comprised of multiple conductors within the cable jacket or sheath to form a single EGC) as permitted by [310.10\(H\)\(5\)](#).

250.191 Grounding System at Alternating-Current Substations. For ac substations, the grounding system shall be in accordance with [Part III](#) of [Article 250](#).

Informational Note: For further information on outdoor ac substation grounding, see [IEEE 80-2013](#), *IEEE Guide for Safety in AC Substation Grounding*.

250.194 Grounding and Bonding of Fences and Other Metal Structures. Metallic fences enclosing, and other metal structures in or surrounding, a substation with exposed electrical conductors and equipment shall be grounded and bonded to limit step, touch, and transfer voltages.

(A) Metal Fences. Where metal fences are located within 5 m (16 ft) of the exposed electrical conductors or equipment, the fence shall be bonded to the grounding electrode system with wire-type bonding jumpers as follows:

- (1) Bonding jumpers shall be installed at each fence corner and at maximum 50 m (160 ft) intervals along the fence.
- (2) Where bare overhead conductors cross the fence, bonding jumpers shall be installed on each side of the crossing.
- (3) Gates shall be bonded to the gate support post, and each gate support post shall be bonded to the grounding electrode system.
- (4) Any gate or other opening in the fence shall be bonded across the opening by a buried bonding jumper.
- (5) The grounding grid or grounding electrode systems shall be extended to cover the swing of all gates.
- (6) The barbed wire strands above the fence shall be bonded to the grounding electrode system.

Alternate designs performed under engineering supervision shall be permitted for grounding or bonding of metal fences.

Informational Note No. 1: A nonconducting fence or section may provide isolation for transfer of voltage to other areas.

Informational Note No. 2: See [IEEE 80-2013](#), *IEEE Guide for Safety in AC Substation Grounding*, for design and installation of fence grounding.

(B) Metal Structures. All exposed conductive metal structures, including guy wires within 2.5 m (8 ft) vertically or 5 m (16 ft) horizontally of exposed conductors or equipment and subject to contact by persons, shall be bonded to the grounding electrode systems in the area.

Metal fences around substations must be grounded to limit the rise of hazardous voltage on the fence. For situations where step and touch potential considerations indicate that additional grounding and bonding design is required, alternate designs performed under engineering supervision are permitted.

280.25 Grounding Electrode Conductor Connections and Enclosures

Part I. General

280.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge arresters installed on premises wiring systems over 1000 volts.

Voltage surges with peaks of several thousand volts, even on 120 volt circuits, are not uncommon. Surges occur because of induced voltages in power and transmission lines resulting from lightning strikes in the vicinity of the line. Surges also occur as a result of switching inductive circuits. The standard on surge arresters is ANSI/IEEE C62.11, *Standard for Metal-Oxide Surge Arresters for Alternating-Current Power Systems (> 1 kV)*.

280.3 Number Required. Where used at a point on a circuit, a surge arrester shall be connected to each ungrounded conductor. A single installation of such surge arresters shall be permitted to protect a number of interconnected circuits, if no circuit is exposed to surges while disconnected from the surge arresters

280.4 Surge Arrester Selection. The surge arresters shall comply with 280.4(A) and (B).

(A) Rating. The rating of a surge arrester shall be equal to or greater than the maximum continuous operating voltage available at the point of application.

(1) Solidly Grounded Systems. The maximum continuous operating voltage shall be the phase-to-ground voltage of the system.

(2) Impedance or Ungrounded System. The maximum continuous operating voltage shall be the phase-to-phase voltage of the system.

(B) Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall be not less than 125 percent of the rating specified in 280.4(A).

Informational Note No. 1: For further information on surge arresters, see IEEE C62.11-2012, *Standard for Metal-Oxide Surge Arresters for Alternating-Current Power Circuits (> 1 kV)*; and IEEE C62.22-2009, *Guide for the Application of Metal-Oxide Surge Arresters for Alternating-Current Systems*.

Informational Note No. 2: The selection of a properly rated metal oxide arrester is based on considerations of maximum continuous operating voltage and the magnitude and duration of overvoltages at the arrester location as affected by phase-to-ground faults, system grounding techniques, switching surges, and other causes. See the manufacturer's application rules for selection of the specific arrester to be used at a particular location.

Part II. Installation

280.11 Location. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

Maximum protection is achieved where the surge-protective device is located as close as practicable to the equipment being protected. When a surge passes through an arrester, a wave is reflected in both directions on the conductors connected to the surge arrester. The magnitude of the reflected wave increases as the distance from the arrester increases. If the length of the conductor between the protected equipment and the surge arrester is short, the magnitude of the wave reflected through the equipment is minimized.

280.12 Uses Not Permitted. A surge arrester shall not be installed where the rating of the surge arrester is less than the maximum continuous phase-to-ground voltage at the power frequency available at the point of application.

280.14 Routing of Surge Arrester Grounding Conductors. The conductor used to connect the surge arrester to line bus, or equipment and to a grounding conductor connection point as provided in 280.21 shall not be any longer than necessary and shall avoid unnecessary bends.

Part III. Connecting Surge Arresters

280.21 Connection. The arrester shall be connected to one of the following:

- (1) Grounded service conductor
- (2) Grounding electrode conductor
- (3) Grounding electrode for the service
- (4) Equipment grounding terminal in the service equipment

280.23 Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 6 AWG copper or aluminum.

280.24 Interconnections. The surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 280.24(A), (B), or (C).

(A) Metal Interconnections. A metal interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding electrode conductor, if, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) Additional Grounding Connection. The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. In urban water-pipe areas where there are at least four water-pipe connections on the neutral conductor and not fewer than four such connections in each mile of neutral conductor, the metal interconnection shall be permitted to be made to the secondary neutral conductor with omission of the direct grounding connection at the surge arrester.

(2) Multigrounded Neutral System Connection. The grounded conductor of the secondary system is a part of a multigrounded neutral system or static wire of which the primary neutral conductor or static wire has at least four grounding connections in each 1.6 km (1 mile) of line in addition to a grounding connection at each service.

Maximum protection is achieved where the surge-protective device protecting a transformer supplying a secondary system has the grounded conductor of the secondary system connected to at least four grounding locations for every one mile of primary neutral conductor.

(B) Through Spark Gap or Device. Where the surge arrester grounding electrode conductor is not connected as in 280.24(A), or where the secondary is not grounded as in 280.24(A) but is otherwise grounded as in 250.52, an interconnection shall be made through a spark gap or listed device as required by 280.24(B)(1) or (B)(2).

A spark gap device has two conductors separated by a gap often filled with a gas such as air. This permits an arc to pass between the conductors when the voltage difference between them exceeds the breakdown voltage of the gas within the gap. The arc forms, ionizing the gas, and reduces its electrical resistance, allowing the high voltage surge to pass to ground.

(1) Ungrounded or Unigrounded Primary System. For ungrounded or unigrounded primary systems, the spark gap or listed device shall have a 60-Hz breakdown voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge-arrester grounding electrode.

(2) Multigrounded Neutral Primary System. For multigrounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge-arrester grounding electrode.

(C) By Special Permission. An interconnection of the surge-arrester ground and the secondary neutral conductor, other than as provided in 280.24(A) or (B), shall be permitted to be made only by special permission.

280.25 Grounding Electrode Conductor Connections and Enclosures. Except as indicated in this article, surge-arrester grounding electrode conductor connections shall be made as specified in Article 250, Parts III and X. Grounding electrode conductors installed in metal enclosures shall comply with 250.64(E).

- 285.25 Type 3 SPDs
- 285.26 Conductor Size
- 285.27 Connection Between Conductors
- 285.28 Grounding Electrode Conductor Connections and Enclosures

Part I. General

285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge-protective devices (SPDs) permanently installed on premises wiring systems of 1000 volts or less.

Informational Note: Surge arresters 1000 volts or less are also known as Type 1 SPDs.

EXHIBIT 285.1 Two SPDs suitable for service-entrance installation — one for direct connection to panelboard busbars and one for mounting in a cabinet or enclosure knockout. (Courtesy of General Electric)

The delineation between SPDs covered by [Article 280](#) and those covered by [Article 285](#) is the voltage rating of the supply system. The designations of SPDs are varied, depending on their location in the premises wiring system. For instance, a Type 1 SPD is permitted to be connected on the supply side of the service or building disconnecting means. Type 2 and Type 3 SPDs must be installed on the load side of overcurrent protective devices and are the devices formerly referred to by this article as TVSSs. Two examples of SPDs are shown in [Exhibit 285.1](#).

285.3 Uses Not Permitted. An SPD device shall not be installed in the following:

- (1) Circuits over 1000 volts
- (2) On ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems
- (3) Where the rating of the SPD is less than the maximum continuous phase-to-ground voltage at the power frequency available at the point of application

285.4 Number Required. Where used at a point on a circuit, the SPD shall be connected to each ungrounded conductor.

285.6 Listing. An SPD shall be a listed device.

UL 1449, *Standard for Surge Protective Devices*, covers Types 1, 2, 3, and 4 devices. SPDs are permitted to be installed on ungrounded systems, impedance grounded systems, and corner grounded systems where the device is listed for the specific characteristic of the system per [285.3\(2\)](#).

285.7 Short-Circuit Current Rating. The SPD shall be marked with a short-circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

In residential and small commercial electrical systems, the first SPD is commonly installed either as an integral component of or near to the service-entrance equipment.

EXHIBIT 285.2 An SPD as an integral component of a receptacle, providing local point-of-use protection of equipment when transient events occur within the facility. (Courtesy of Legrand®)

Depending on the system voltage, surge protection in larger commercial and industrial electrical systems can be provided by installing a Type 1 SPD (a surge arrester for systems 1 kilovolt and less) or surge arrester (the devices covered in [Article 280](#) for systems over 1 kilovolt) on the line side of the service equipment. Subsequent levels of SPDs are then provided at intermediate points in the distribution system (such as at panelboards that serve loads susceptible to transients) and at the point where utilization equipment connects to the electrical system.

Point-of-use SPDs such as receptacles and relocatable power taps (power strips) may be installed at the equipment (such as computers or equipment with electronic controls). The function of a point-of-use SPD is to remove small transients that pass through the more robust surge devices located at the service. Point-of-use SPD devices are also useful in removing small transients that have been generated within the building. See [Exhibit 285.2](#) for a point-of-use or Type 3 SPD.

Part II. Installation

285.11 Location. SPDs shall be permitted to be located indoors or outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

285.12 Routing of Connections. The conductors used to connect the SPD to the line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

High-frequency currents, such as those common to lightning discharges, tend to reduce the effectiveness of a conductor that connects the device to ground. To optimize performance of SPDs, the length of the conductor

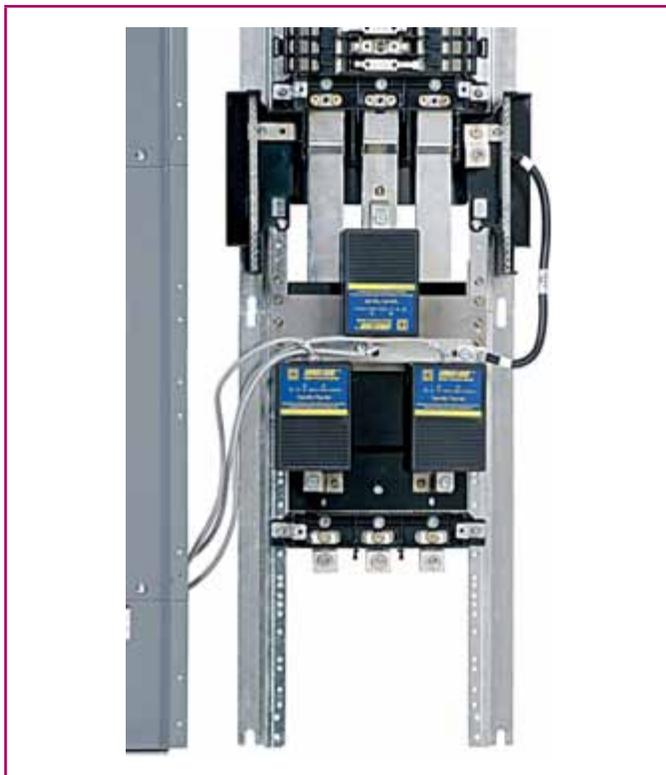

EXHIBIT 285.3 A Type 2 SPD mounted as an integral component of a panelboard, which minimizes conductor length between the electrical system and the SPD. (Courtesy of Schneider Electric)

that connects the device to ground is limited. Short conductors with few bends will have a lower impedance to surge current. Higher impedance drives the clamping voltage higher and reduces the protection provided by the SPD unit. Maximum protection is achieved where the SPD is located as close as practicable to the equipment being protected as shown in Exhibit 285.3.

285.13 Type 4 and Other Component Type SPDs. Type 4 component assemblies and other component type SPDs shall only be installed by the equipment manufacturer.

Type 4 and other component-type SPDs are incomplete devices that are only acceptable when installed as part of listed equipment.

Part III. Connecting SPDs

285.21 Connection. Where an SPD device is installed, it shall comply with 285.23 through 285.28.

The point in the electrical system where SPDs are connected is dependent on the type of SPD. UL 1449, *Standard for Surge Protection Devices*, is the product standard used to evaluate safe performance of SPDs. A Type 2 SPD must be installed on the load side of the service-disconnect overcurrent protection unless installed in accordance with 230.82(8), and a Type 3 SPD must be installed on the load side of a branch-circuit overcurrent protective device. The requirement for Type 2 SPDs to be

connected on the load side of the first overcurrent protection device in a feeder-supplied structure is necessary due to the exposure of external feeder conductors to a more hostile surge environment such as lightning.

Two requirements — 230.82(4) for Type 1 surge-protection devices and 230.82(8) for Type 2 surge-protection devices — permit the installation of SPDs on the line side of the service disconnecting means. Section 230.71(A) permits an additional disconnecting means at the service equipment for SPDs installed as part of listed equipment. The disconnecting means for the SPD does not count as one of the six permitted by 230.71(A) where the SPD and its disconnecting means are provided in the listed equipment by the manufacturer. Type 2 SPDs must be installed in listed equipment where the SPD is provided with a disconnecting means and overcurrent protection.

285.23 Type 1 SPDs. Type 1 SPDs shall be installed in accordance with 285.23(A) and (B).

(A) Installation. Type 1 SPDs shall be installed as follows:

- (1) Type 1 SPDs shall be permitted to be connected to the supply side of the service disconnect as permitted in 230.82(4), or
- (2) Type 1 SPDs shall be permitted to be connected as specified in 285.24.

(B) At the Service. When installed at services, Type 1 SPDs shall be connected to one of the following:

- (1) Grounded service conductor
- (2) Grounding electrode conductor
- (3) Grounding electrode for the service
- (4) Equipment grounding terminal in the service equipment

Although four locations for connecting the SPD grounding lead are acceptable, the requirement in 285.12 covering the length and physical routing of the conductor must be followed.

See also

285.12 and its commentary for more information on the importance of controlling the length and physical routing of the conductor

285.24 Type 2 SPDs. Type 2 SPDs shall be installed in accordance with 285.24(A) through (C).

(A) Service-Supplied Building or Structure. Type 2 SPDs shall be connected anywhere on the load side of a service disconnect overcurrent device required in 230.91, unless installed in accordance with 230.82(8).

(B) Feeder-Supplied Building or Structure. Type 2 SPDs shall be connected at the building or structure anywhere on the load side of the first overcurrent device at the building or structure.

(C) Separately Derived System. The SPD shall be connected on the load side of the first overcurrent device in a separately derived system.

285.25 Type 3 SPDs. Type 3 SPDs shall be permitted to be installed on the load side of branch-circuit overcurrent protection up to the equipment served. If included in the manufacturer's instructions, the Type 3 SPD connection shall be a minimum 10 m (30 ft) of conductor distance from the service or separately derived system disconnect.

285.26 Conductor Size. Line and grounding conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

285.27 Connection Between Conductors. An SPD shall be permitted to be connected between any two conductors — ungrounded

conductor(s), grounded conductor, equipment grounding conductor, or grounding electrode conductor. The grounded conductor and the equipment grounding conductor shall be interconnected only by the normal operation of the SPD during a surge.

285.28 Grounding Electrode Conductor Connections and Enclosures. Except as indicated in this article, SPD grounding connections shall be made as specified in [Article 250, Part III](#). Grounding electrode conductors installed in metal enclosures shall comply with [250.64\(E\)](#).

 - (C) Protection from Damage

- (D) Splices
- (E) Backfill
- (F) Raceway Seal

Part I. General Requirements

300.1 Scope.

(A) All Wiring Installations. This article covers general requirements for wiring methods and materials for all wiring installations unless modified by other articles in **Chapter 3**.

(B) Integral Parts of Equipment. The provisions of this article are not intended to apply to the conductors that form an integral part of equipment, such as motors, controllers, motor control centers, or factory-assembled control equipment or listed utilization equipment.

Requirements for specific wiring methods can be found in the **Chapter 3** article governing that particular wiring method, but the overarching requirements for wiring methods are covered in this first article of **Chapter 3**. **Chapters 5 through 7** modify some of the requirements of **Article 300**. **Chapter 8** is not subject to the requirements of **Article 300**, except where specifically referenced. **Article 300** also covers wiring requirements within boxes, conduit bodies, and fittings. Additional wiring requirements are found in **Articles 312 and 314**.

Wiring within equipment is not within the scope of this article. Integral wiring of equipment is generally covered by product standards. For example, integral wiring of motors is covered by NEMA MG 1, *Motors and Generators*; industrial control panels by UL 508A, *Standard for Industrial Control Panels*; and industrial machinery by NFPA 79, *Electrical Standard for Industrial Machinery*.

(C) Metric Designators and Trade Sizes. Metric designators and trade sizes for conduit, tubing, and associated fittings and accessories shall be as designated in **Table 300.1(C)**.

Metric designators are used for traditional trade size threaded conduit. They do not change the physical dimensions or the traditional "NPT-type"

TABLE 300.1(C) Metric Designators and Trade Sizes

Metric Designator	Trade Size
12	3/8
16	1/2
21	3/4
27	1
35	1 1/4
41	1 1/2
53	2
63	2 1/2
78	3
91	3 1/2
103	4
129	5
155	6

Note: The metric designators and trade sizes are for identification purposes only and are not actual dimensions.

threads of the conduit. Metric designators are simply another method of identifying the size of a circular raceway. [Table 300.1\(C\)](#) identifies a distinct metric designator for each circular raceway trade size. The unit of measure has not been included because it reflects a “modular” or “relative” measure rather than an exact dimension. As stated in the table footnote, the metric designators and trade sizes are not actual dimensions.

Each metric designator-sized circular raceway is identical in dimension (including manufacturing tolerances) to its trade size counterpart in [Table 4](#) of [Chapter 9](#). Therefore, the [Informative Annex C](#) wire fill tables are applicable to both metric designator and trade size circular raceways.

Threaded joints on circular raceways are a concern. For example, [344.6](#) requires RMC to be listed and the appropriate product standard is [ANSI/UL 6, Electrical Rigid Metal Conduit — Steel](#). Listed conduit must be threaded in accordance with [ANSI/ASME B.1.20.1-1983, Pipe Threads, General Purpose \(Inch\)](#). Therefore, only conduit threaded to the traditional dimension of 3/4-inch taper per foot is acceptable. Simply stated, although conduit with a metric designator is permitted, metric-threaded conduit is not permitted by the *NEC*®. This aligns with [500.8\(E\)\(2\)](#), for example, which states that although metric threads are permitted on equipment, an adapter must be used for connection to conduit.

300.2 Limitations.

(A) Voltage. Wiring methods specified in [Chapter 3](#) shall be used for 1000 volts, nominal, or less where not specifically limited in some section of [Chapter 3](#). They shall be permitted for over 1000 volts, nominal, where specifically permitted elsewhere in this *Code*.

Where an installation involves requirements using different voltage range limits, the limits within each applicable article must be observed.

(B) Temperature Temperature limitation of conductors shall be in accordance with [310.15\(A\)\(3\)](#).

300.3 Conductors.

(A) Single Conductors. Single conductors specified in [Table 310.104\(A\)](#) shall only be installed where part of a recognized wiring method of [Chapter 3](#).

Exception: Individual conductors shall be permitted where installed as separate overhead conductors in accordance with [225.6](#).

Individual insulated conductors, such as THHN, are prohibited from use in other than recognized wiring methods. The exception points out two long-time permissions — allowing individual conductors as overhead spans and as festoon lighting.

(B) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors and bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, cablebus assembly, trench, cable, or cord, unless otherwise permitted in accordance with [300.3\(B\)\(1\)](#) through [\(B\)\(4\)](#).

All conductors of an individual circuit must be grouped in order to reduce inductive heating and to avoid increases in overall circuit impedance. A similar rule is found in [300.5\(l\)](#).

(1) Paralleled Installations. Conductors shall be permitted to be run in parallel in accordance with the provisions of [310.10\(H\)](#). The requirement to run all circuit conductors within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord shall apply separately to each portion of the paralleled installation, and the equipment grounding conductors shall comply with the provisions of [250.122](#). Parallel runs in cable tray shall comply with the provisions of [392.20\(C\)](#).

Exception: Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase, neutral, and grounded conductor installations. The raceways shall be installed in close proximity, and the isolated phase, neutral, and grounded conductors shall comply with the provisions of [300.20\(B\)](#).

(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of [250.130\(C\)](#) for certain existing installations or in accordance with [250.134\(B\)](#), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with [250.102\(E\)](#).

(3) Nonferrous Wiring Methods. Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath, where run in different raceways, auxiliary gutters, cable trays, trenches, cables, or cords, shall comply with the provisions of [300.20\(B\)](#). Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of [332.31](#). Conductors of single-conductor Type MC cable with a nonmagnetic sheath shall comply with the provisions of [330.31](#), [330.116](#), and [300.20\(B\)](#).

(4) Column-Width Panelboard Enclosures. Where an auxiliary gutter runs between a column-width panelboard and a pull box, and the pull box includes neutral terminations, the neutral conductors of circuits supplied from the panelboard shall be permitted to originate in the pull box.

(C) Conductors of Different Systems.

(1) 1000 Volts, Nominal, or Less. Conductors of ac and dc circuits, rated 1000 volts, nominal, or less, shall be permitted to occupy the same equipment wiring enclosure, cable, or raceway. All conductors shall have an insulation rating equal to at least the maximum circuit voltage applied to any conductor within the enclosure, cable, or raceway.

Secondary wiring to electric-discharge lamps of 1000 volts or less, if insulated for the secondary voltage involved, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.

Informational Note No. 1: See [725.136\(A\)](#) for Class 2 and Class 3 circuit conductors.

Informational Note No. 2: See [690.4\(B\)](#) for photovoltaic source and output circuits.

For systems of 1000 volts or less, the maximum circuit voltage in the raceway is what determines the minimum voltage rating required for

the insulation of conductors, not the maximum insulation voltage rating of the conductors in the raceway.

Informational Note No. 2 references 690.4(B), which prohibits the location of solar photovoltaic circuits within the same enclosure as conductors of other systems unless separated by a partition. Additionally, 700.10(B) requires that circuit wiring for emergency systems be kept entirely independent of all other wiring and equipment.

(2) Over 1000 Volts, Nominal. Conductors of circuits rated over 1000 volts, nominal, shall not occupy the same equipment wiring enclosure, cable, or raceway with conductors of circuits rated 1000 volts, nominal, or less unless otherwise permitted in 300.3(C)(2)(a) through 300.3(C)(2)(d).

(a) Primary leads of electric-discharge lamp ballasts insulated for the primary voltage of the ballast, where contained within the individual wiring enclosure, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.

(b) Excitation, control, relay, and ammeter conductors used in connection with any individual motor or starter shall be permitted to occupy the same enclosure as the motor-circuit conductors.

(c) In motors, transformers, switchgear, switchboards, control assemblies, and similar equipment, conductors of different voltage ratings shall be permitted.

(d) In manholes, if the conductors of each system are permanently and effectively separated from the conductors of the other systems and securely fastened to racks, insulators, or other approved supports, conductors of different voltage ratings shall be permitted.

Conductors having nonshielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, or raceway.

300.4 Protection Against Physical Damage. Where subject to physical damage, conductors, raceways, and cables shall be protected.

(A) Cables and Raceways Through Wood Members.

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1¼ in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate(s) or bushing(s), at least 1.6 mm (⅙ in.) thick, and of appropriate length and width installed to cover the area of the wiring.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

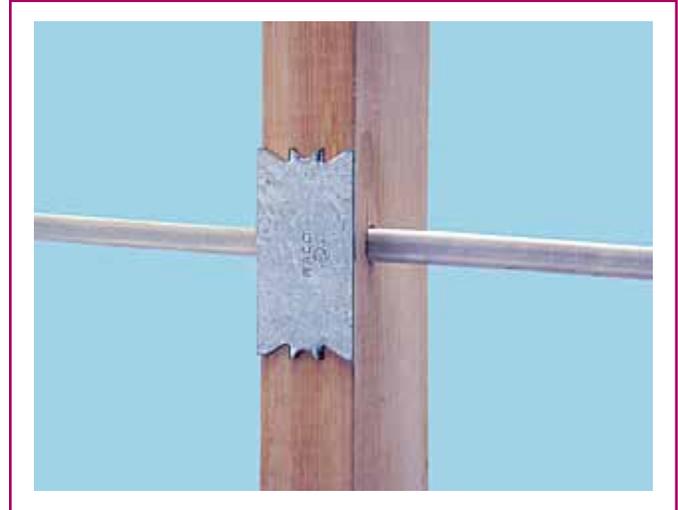

EXHIBIT 300.1 A listed and marked steel plate, permitted to be less than ⅙ inch only if it is listed and marked, used to protect a nonmetallic-sheathed cable less than ¼ inches from the edge of a wood stud. (Courtesy of Hubbell Incorporated)

Exception No. 2: A listed and marked steel plate less than 1.6 mm (⅙ in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

The intent is to prevent nails and screws from being driven into conductors, cables, and raceways. As shown in Exhibit 300.1, if the edge of a drilled hole is less than ¼ inch from the nearest edge of a wood stud, a plate is required to prevent screws or nails from penetrating the stud far enough to injure a cable. Building codes limit the maximum size of bored or notched holes in studs, and 300.4(A)(2) indicates that consideration should be given to the size of notches in studs, so as not to affect the strength of the structure.

(2) Notches in Wood. Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (⅙ in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (⅙ in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(B) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.

(1) Nonmetallic-Sheathed Cable. In both exposed and concealed locations where nonmetallic-sheathed cables pass through

either factory- or field-punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.

(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm ($1/16$ in.) in thickness shall be used to protect the cable or tubing.

Exception: A listed and marked steel plate less than 1.6 mm ($1/16$ in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(C) Cables Through Spaces Behind Panels Designed to Allow Access. Cables or raceway-type wiring methods, installed behind panels designed to allow access, shall be supported according to their applicable articles.

Cable- or raceway-type wiring installed above suspended ceilings with lift-up panels must not be laid on the suspended ceiling; this would inhibit access. Such wiring is required to be supported according to 300.11(A), 300.23, and the requirements of the Chapter 3 article applicable to the particular wiring method.

Similarly, low-voltage, optical fiber, broadband, and communications cables are also not permitted to block access to equipment above the suspended ceiling.

(D) Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm ($1\frac{1}{4}$ in.) from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm ($1/16$ in.) thick.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.

Exception No. 3: A listed and marked steel plate less than 1.6 mm ($1/16$ in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

To prevent mechanical damage to cables and raceways from nails and screws, the raceways need the same level of physical protection at furring strips as they do at framing members. Two means of protection that

EXHIBIT 300.2 Nonmetallic sheathed cables adjacent to furring strips in a wood frame structure.

generally apply to exposed or concealed work are described. The first method, shown in Exhibit 300.2, is to position the NM cables a clear distance from the nearest edge of the furring strip. Exhibit 300.3 illustrates the NM cable installed parallel to framing members and fastened to maintain clearance from the edge. The second method requires physical protection, such as a steel plate or a sleeve, if the $1\frac{1}{4}$ -inch clearance cannot be maintained. (A steel plate is illustrated in Exhibit 300.1.)

(E) Cables, Raceways, or Boxes Installed in or Under Roof Decking. A cable, raceway, or box, installed in exposed or concealed locations under metal-corrugated sheet roof decking, shall be installed and supported so there is not less than 38 mm ($1\frac{1}{2}$ in.) measured from the lowest surface of the roof decking to the top of the cable, raceway, or box. A cable, raceway, or box shall not be installed in concealed locations in metal-corrugated, sheet decking-type roof.

Informational Note: Roof decking material is often repaired or replaced after the initial raceway or cabling and roofing installation and may be penetrated by the screws or other mechanical devices designed to provide “hold down” strength of the waterproof membrane or roof insulating material.

Exception: Rigid metal conduit and intermediate metal conduit shall not be required to comply with 300.4(E).

For cables, raceways, and boxes installed below a metal-corrugated sheet roof decking installation, 300.4(E) requires at least $1\frac{1}{2}$ inches of separation from any of the roof decking surface, as illustrated in Exhibit 300.4. The $1\frac{1}{2}$ -inch dimension is measured from the lowest point of the roof deck to the top surface of the cable, raceway, or box. This section prohibits cables, raceways, or boxes from being installed in the space between the metal deck and the roofing material.

Roof replacement materials are fastened in place with long screws, which penetrate the roof decking installation and could continue into

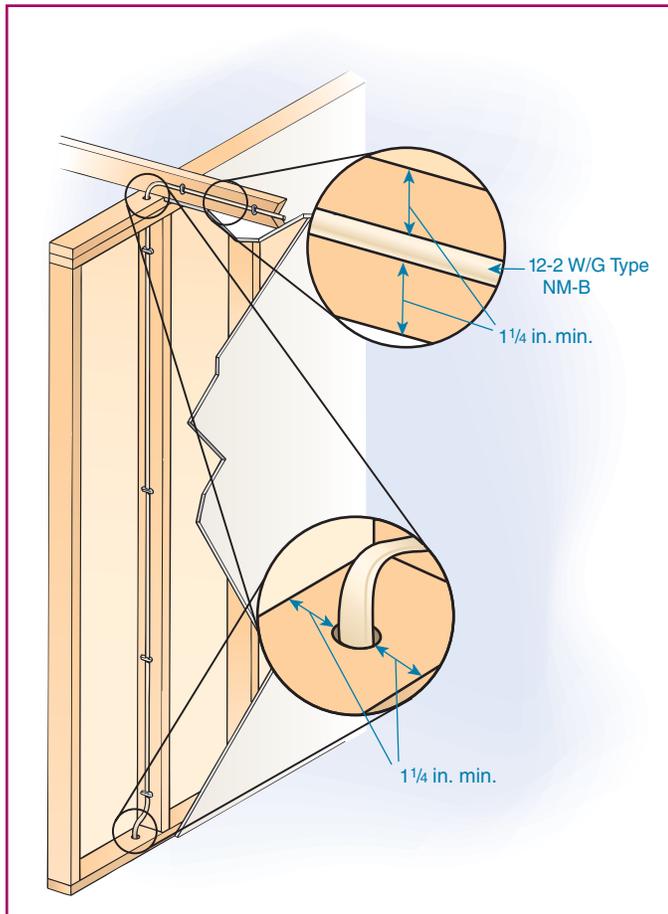

EXHIBIT 300.3 Cables and raceways installed parallel to framing members.

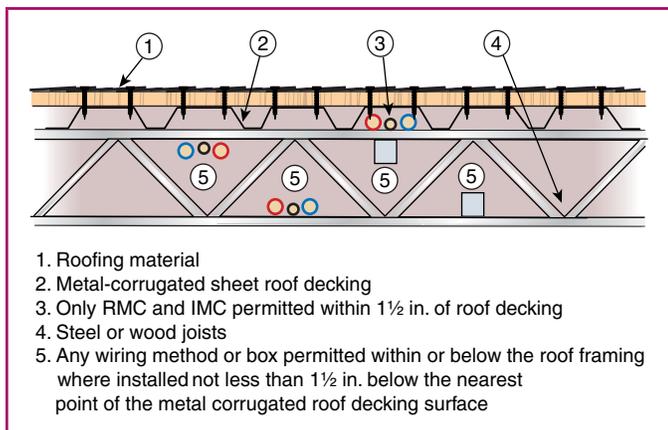

EXHIBIT 300.4 Placement of cables and raceways under metal-corrugated sheet roof decking to avoid physical damage.

cables and raceways installed below. Adequate space between the corrugated sheet metal roof deck installation and the cables and raceways below the deck will prevent future damage to the cable or raceway installation. The exception clarifies that this requirement does not apply to more robust metal raceways such as RMC and IMC.

See also

410.10(F) for similar requirements for luminaires

(F) Cables and Raceways Installed in Shallow Grooves.

Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.6 mm ($\frac{1}{16}$ in.) thick steel plate, sleeve, or equivalent or by not less than 32-mm ($1\frac{1}{4}$ -in.) free space for the full length of the groove in which the cable or raceway is installed.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm ($\frac{1}{16}$ in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(G) Insulated Fittings. Where raceways contain 4 AWG or larger insulated circuit conductors, and these conductors enter a cabinet, a box, an enclosure, or a raceway, the conductors shall be protected by an identified fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the fitting or raceway by identified insulating material that is securely fastened in place.

Exception: Where threaded hubs or bosses that are an integral part of a cabinet, box, enclosure, or raceway provide a smoothly rounded or flared entry for conductors.

Conduit bushings constructed wholly of insulating material shall not be used to secure a fitting or raceway. The insulating fitting or insulating material shall have a temperature rating not less than the insulation temperature rating of the installed conductors.

Heavy conductors and cables tend to stress the conductor insulation at raceway terminating points. Insulated bushing or smooth rounded entries are required at raceway and cable terminations to reduce the risk of insulation failure at conductor insulation stress points. The temperature ratings of the insulating bushing must coordinate with the insulation of the conductor to ensure that the conductor is protected for its entire life cycle.

Whether provided separately or as part of a fitting, listed insulating bushings are colored black or brown to indicate a temperature rating of 150°C and any other color to indicate a rating of 90°C unless specifically marked for a higher temperature. **Exhibit 300.5** shows an insulated thermoplastic or fiber bushing used to protect the conductors from chafing against a metal conduit fitting. Note the use of a double locknut, with one on the inside and one on the outside of the enclosure. The locknuts are necessary because the raceway cannot be secured by the fiber or plastic bushing.

See also

342.46, **344.46**, and **352.46** for further information relating to bushings

(H) Structural Joints. A listed expansion/deflection fitting or other approved means shall be used where a raceway crosses a

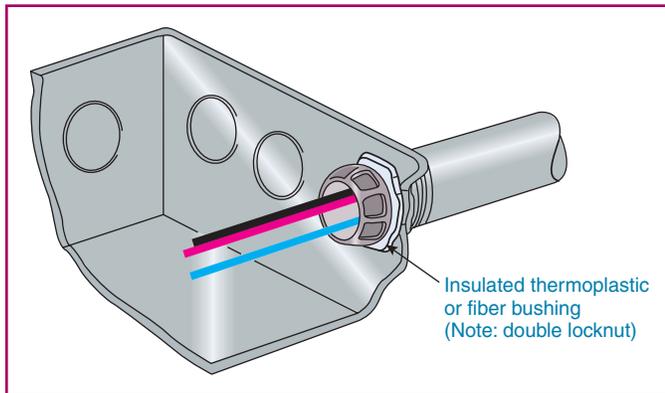

EXHIBIT 300.5 An insulated bushing used to protect conductors from chafing against a metal conduit fitting.

structural joint intended for expansion, contraction or deflection, used in buildings, bridges, parking garages, or other structures.

Raceways can be damaged if improperly installed in structural construction joints, leaving conductors or cables exposed. Structural construction joints can experience shear and lateral loads due to gravity, expansion and contraction, and movement of the structure. Listed expansion/deflection fittings are available for use at structural joints. However, other approved means of protecting the integrity of the raceways system are also permitted.

300.5 Underground Installations.

(A) Minimum Cover Requirements. Direct-buried cable, conduit, or other raceways shall be installed to meet the minimum cover requirements of [Table 300.5](#).

[Table 300.5](#) requires conductors under residential driveways to be at least 18 inches below grade. However, if the conductors are protected by an overcurrent device rated at not more than 20 amperes and provided with GFCI protection for personnel, column 4 permits the burial depth to be reduced to 12 inches. [Exhibits 300.6](#) and [300.7](#) show examples of underground installations of 18 inches and 12 inches, respectively. Footnote a in column 5 permits wiring at depths less than the minimum if it is specified by the manufacturer's instructions. Footnote b permits column 5 to apply to circuits for pool, spa, and fountain lighting provided that the circuit voltage is 30 volts or less and it is installed in a nonmetallic raceway.

See also

[300.50](#) where circuits exceed 1000 volts

(B) Wet Locations. The interior of enclosures or raceways installed underground shall be considered to be a wet location. Insulated conductors and cables installed in these enclosures or raceways in underground installations shall comply with [310.10\(C\)](#).

The inside of all raceways and enclosures installed underground is classified as a wet location. Conductors installed in such underground locations must meet one of the following criteria:

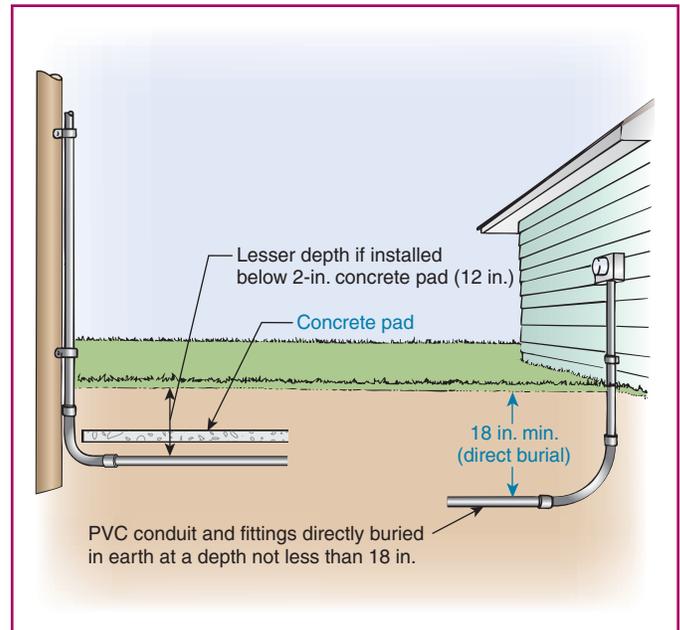

EXHIBIT 300.6 Type PVC conduit buried 18 inches below grade.

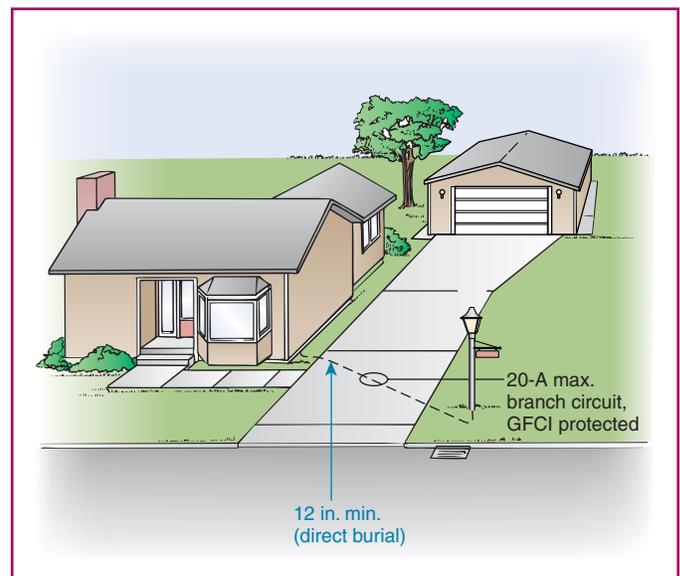

EXHIBIT 300.7 A 20-ampere, GFCI-protected residential branch circuit installed with a minimum burial depth of 12 inches beneath a residential driveway.

1. Be moisture-impervious, metal-sheathed
2. Be Types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THWN, THWN-2, XHHW, XHHW-2, ZW
3. Be of a type listed for use in wet locations

(C) Underground Cables and Conductors Under Buildings. Underground cable and conductors installed under a building shall be in a raceway.

Exception No. 1: Type MI cable shall be permitted under a building without installation in a raceway where embedded in

^aA lesser depth shall be permitted where specified in the installation instructions of a listed low-voltage lighting system.

^bA depth of 150 mm (6 in.) shall be permitted for pool, spa, and fountain lighting, installed in a nonmetallic raceway, limited to not more than 30 volts where part of a listed low-voltage lighting system.

Notes:

1. Cover is defined as the shortest distance in mm (in.) measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.
2. Raceways approved for burial only where concrete encased shall require concrete envelope not less than 50 mm (2 in.) thick.
3. Lesser depths shall be permitted where cables and conductors rise for terminations or splices or where access is otherwise required.
4. Where one of the wiring method types listed in Columns 1 through 3 is used for one of the circuit types in Columns 4 and 5, the shallowest depth of burial shall be permitted.
5. Where solid rock prevents compliance with the cover depths specified in this table, the wiring shall be installed in a metal raceway, or a nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm (2 in.) of concrete extending down to rock.

concrete, fill, or other masonry in accordance with 332.10(6) or in underground runs where suitably protected against physical damage and corrosive conditions in accordance with 332.10(10).

Exception No. 2: Type MC cable listed for direct burial or concrete encasement shall be permitted under a building without installation in a raceway in accordance with 330.10(A)(5) and in wet locations in accordance with 330.10(A)(11).

(D) Protection from Damage. Direct-buried conductors and cables shall be protected from damage in accordance with 300.5(D)(1) through (D)(4).

(1) Emerging from Grade. Direct-buried conductors and cables emerging from grade and specified in columns 1 and 4 of Table 300.5 shall be protected by enclosures or raceways extending from the minimum cover distance below grade required by 300.5(A) to a point at least 2.5 m (8 ft) above finished grade. In no case shall the protection be required to exceed 450 mm (18 in.) below finished grade.

(2) Conductors Entering Buildings. Conductors entering a building shall be protected to the point of entrance.

(3) Service Conductors. Underground service conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.

The warning ribbon reduces the risk of an accident, such as an electrocution or an arc-flash incident during excavation near underground service conductors that are not encased in concrete, because these circuits are not protected from short circuit and overload.

(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in electrical metallic tubing, rigid metal conduit, intermediate metal conduit, RTRC-XW, Schedule 80 PVC conduit, or equivalent.

(E) Splices and Taps. Direct-buried conductors or cables shall be permitted to be spliced or tapped without the use of splice boxes. The splices or taps shall be made in accordance with 110.14(B).

Underground splices are not required to be in a box if they are made in accordance with 110.14(B), which requires the splicing means to be listed for underground use. Listed sealed wire connector systems restore the insulation integrity of the spliced conductors in a permanent joint. Sealed wire connectors are used where future access to the splices will not be necessary.

The difference between multiconductor cables labeled for direct burial and single conductors labeled for direct burial is that direct-burial multiconductor cables may or may not contain individual conductors labeled for direct burial. The overall cable jacket may be the only underground protection technique for the contained conductors. Although the direct-burial splicing techniques used on multiconductor cables can differ widely from the techniques used on direct-burial single-conductor

EXHIBIT 300.8 One underground splicing method. (Courtesy of 3M Co., Electrical Markets Division)

cables, the NEC requirements are generally the same. The splicing technique must be listed for the cable type and listed for direct burial. Exhibit 300.8 shows a sealed wire connector system listed for direct burial used to splice single-conductor installed underground cables.

(F) Backfill. Backfill that contains large rocks, paving materials, cinders, large or sharply angular substances, or corrosive material shall not be placed in an excavation where materials may damage raceways, cables, conductors, or other substructures or prevent adequate compaction of fill or contribute to corrosion of raceways, cables, or other substructures.

Where necessary to prevent physical damage to the raceway, cable, or conductor, protection shall be provided in the form of granular or selected material, suitable running boards, suitable sleeves, or other approved means.

(G) Raceway Seals. Conduits or raceways through which moisture may contact live parts shall be sealed or plugged at either or both ends. Spare or unused raceways shall also be sealed. Sealants shall be identified for use with the cable insulation, conductor insulation, bare conductor, shield, or other components.

Informational Note: Presence of hazardous gases or vapors may also necessitate sealing of underground conduits or raceways entering buildings.

A conduit sealing bushing, shown in Exhibit 300.9, is one method that prevents the entrance of gas or moisture. See 230.8 for sealing service raceways.

(H) Bushing. A bushing, or terminal fitting, with an integral bushed opening shall be used at the end of a conduit or other raceway that terminates underground where the conductors or cables emerge as a direct burial wiring method. A seal incorporating the physical protection characteristics of a bushing shall be permitted to be used in lieu of a bushing.

A raceway that terminates underground and emerges as a direct-burial cable requires a protective fitting. Exhibit 300.10 shows such a fitting

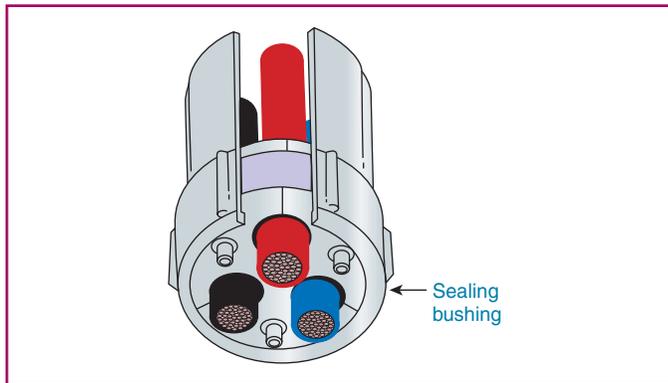

EXHIBIT 300.9 A conduit sealing bushing used to prevent the entrance of gas or moisture. (Redrawn courtesy of O-Z/Gedney, a division of EGS Electrical Group)

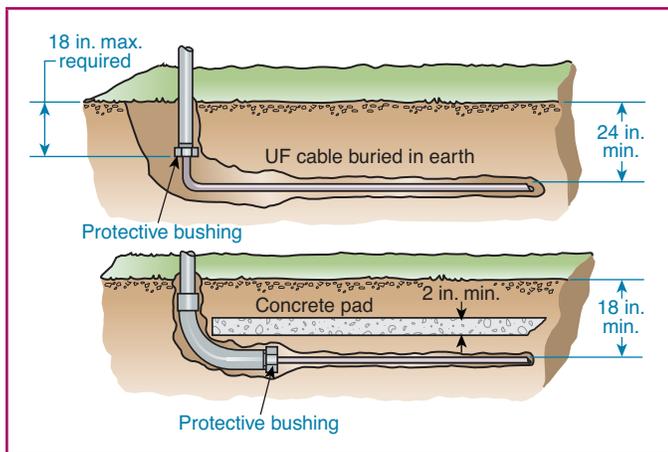

EXHIBIT 300.10 Type UF cable buried in compliance with Table 300.5.

with a Type UF cable buried in compliance with Table 300.5. The bushing will protect the cable from damage by the conduit.

See also

300.4(G) commentary for information regarding the selection and use of insulating fittings

(I) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be installed in the same raceway or cable or shall be installed in close proximity in the same trench.

Exception No. 1: Conductors shall be permitted to be installed in parallel in raceways, multiconductor cables, or direct-buried single conductor cables. Each raceway or multiconductor cable shall contain all conductors of the same circuit, including equipment grounding conductors. Each direct-buried single conductor cable shall be located in close proximity in the trench to the other single conductor cables in the same parallel set of conductors in the circuit, including equipment grounding conductors.

Keeping all circuit conductors together reduces inductive heating and reduces circuit impedance. Section 300.5(I), Exception No. 1, permits the installation of paralleled conductors in different raceways provided all circuit conductors, including equipment grounding conductors, are installed in each of the parallel raceways.

See also

300.3(B), which addresses conductors of the same circuit
310.10(H) for requirements for conductors in parallel

Exception No. 2: Isolated phase, polarity, grounded conductor, and equipment grounding and bonding conductor installations shall be permitted in nonmetallic raceways or cables with a nonmetallic covering or nonmagnetic sheath in close proximity where conductors are paralleled as permitted in 310.10(H), and where the conditions of 300.20(B) are met.

Isolated phase installations contain only one phase per raceway or cable. In an ac circuit installation, the spacing between isolated phase raceways and cables should be as small as possible and the length of the run limited to avoid increased circuit impedance and the resulting increase in voltage drop. Isolated phase installations may be used in ac circuits to limit available fault current at downstream equipment.

Isolated phase installations present an inherent hazard of overheating, which is a risk that must be understood and carefully controlled. This hazard results from induced currents in metal raceways that contains only one phase conductor. The surrounding metal acts as a shorted transformer turn. In underground installations, a single conductor is unlikely to be installed in a metal raceway or, if it were, is unlikely to present a fire hazard. This is not true for aboveground raceways, which is the reason isolated phase installations have limited application for aboveground installations.

See also

300.20(A) and **(B)** for more information on induced currents in raceways

(J) Earth Movement. Where direct-buried conductors, raceways, or cables are subject to movement by settlement or frost, direct-buried conductors, raceways, or cables shall be arranged so as to prevent damage to the enclosed conductors or to equipment connected to the raceways.

Informational Note: This section recognizes “S” loops in underground direct burial cables and conductors to raceway transitions, expansion fittings in raceway risers to fixed equipment, and, generally, the provision of flexible connections to equipment subject to settlement or frost heaves.

Slack must be provided in cables, expansion joints must be used for raceways, or other measures must be taken, if earth movement due to frost or settlement is anticipated.

(K) Directional Boring. Cables or raceways installed using directional boring equipment shall be approved for the purpose.

A number of listed raceways are identified as being suitable for directional boring applications.

300.6 Protection Against Corrosion and Deterioration. Raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes,

cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be of materials suitable for the environment in which they are to be installed.

This correlates with the requirement in 110.11 that equipment be suitable for the environment in which it is installed. For specific applications, the manufacturers' instructions must be followed.

(A) Ferrous Metal Equipment. Ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, nipples, fittings, supports, and support hardware shall be suitably protected against corrosion inside and outside (except threads at joints) by a coating of approved corrosion-resistant material. Where corrosion protection is necessary and the conduit is threaded in the field, the threads shall be coated with an approved electrically conductive, corrosion-resistant compound.

Informational Note: Field-cut threads are those threads that are cut in conduit, elbows, or nipples anywhere other than at the factory where the product is listed.

Exception: Stainless steel shall not be required to have protective coatings.

Ferrous metal equipment must be protected from corrosion with an approved anti-corrosion compound, such as that shown in Exhibit 300.11.

(1) Protected from Corrosion Solely by Enamel. Where protected from corrosion solely by enamel, ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, nipples, fittings, supports, and support hardware shall not be used outdoors or in wet locations as described in 300.6(D)

(2) Organic Coatings on Boxes or Cabinets. Where boxes or cabinets have an approved system of organic coatings and are

EXHIBIT 300.11 KOPR-Shield® (a registered trademark of Jet Lube) is a conductive anti-corrosion surface compound suitable for application on field-cut conduit threads where protection from corrosion is necessary. (Courtesy of Thomas and Betts, A Member of the ABB Group)

marked “Raintight,” “Rainproof,” or “Outdoor Type,” they shall be permitted outdoors.

(3) In Concrete or in Direct Contact with the Earth. Ferrous metal raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, nipples, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subject to severe corrosive influences where made of material approved for the condition, or where provided with corrosion protection approved for the condition.

Metal raceways installed in the earth can be coated with an asphalt compound, plastic sheath, or other equivalent protection to help prevent deterioration. Also, metal raceways are available with a bonded PVC coating. Galvanized steel RMC and steel IMC do not generally require supplementary corrosion protection.

(B) Aluminum Metal Equipment. Aluminum raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, nipples, fittings, supports, and support hardware embedded or encased in concrete or in direct contact with the earth shall be provided with supplementary corrosion protection.

Aluminum conduit in concrete or direct burial normally requires protection due to the corrosive properties of concrete and soil.

(C) Nonmetallic Equipment. Nonmetallic raceways, cable trays, cablebus, auxiliary gutters, boxes, cables with a nonmetallic outer jacket and internal metal armor or jacket, cable sheathing, cabinets, elbows, couplings, nipples, fittings, supports, and support hardware shall be made of material approved for the condition and shall comply with (C)(1) and (C)(2) as applicable to the specific installation.

(1) Exposed to Sunlight. Where exposed to sunlight, the materials shall be listed as sunlight resistant or shall be identified as sunlight resistant.

(2) Chemical Exposure. Where subject to exposure to chemical solvents, vapors, splashing, or immersion, materials or coatings shall either be inherently resistant to chemicals based on their listing or be identified for the specific chemical reagent.

(D) Indoor Wet Locations. In portions of dairy processing facilities, laundries, canneries, and other indoor wet locations, and in locations where walls are frequently washed or where there are surfaces of absorbent materials, such as damp paper or wood, the entire wiring system, where installed exposed, including all boxes, fittings, raceways, and cable used therewith, shall be mounted so that there is at least a 6-mm (¼-in.) airspace between it and the wall or supporting surface.

Exception: Nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.

Informational Note: In general, areas where acids and alkali chemicals are handled and stored may present such corrosive

conditions, particularly when wet or damp. Severe corrosive conditions may also be present in portions of meatpacking plants, tanneries, glue houses, and some stables; in installations immediately adjacent to a seashore and swimming pool areas; in areas where chemical deicers are used; and in storage cellars or rooms for hides, casings, fertilizer, salt, and bulk chemicals.

300.7 Raceways Exposed to Different Temperatures.

(A) Sealing. Where portions of a raceway or sleeve are known to be subjected to different temperatures, and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeve shall be filled with an approved material to prevent the circulation of warm air to a colder section of the raceway or sleeve. An explosionproof seal shall not be required for this purpose.

Condensation can form in raceways or sleeves that are subjected to temperature differences as a result of air circulating through the raceway from a warmer to a colder section. Condensation could accumulate, for example, in a raceway used to supply lighting or branch-circuit conductors within a walk-in refrigerator or freezer. Circulation of air can be prevented by sealing the raceway with a suitable pliable compound at a conduit body or junction box, usually installed in the raceway before it enters the colder section. Special sealing fittings such as those used in hazardous (classified) locations are not necessary.

(B) Expansion, Expansion-Deflection, and Deflection Fittings. Raceways shall be provided with expansion, expansion-deflection, or deflection fittings where necessary to compensate for thermal expansion, deflection, and contraction.

Informational Note: **Table 352.44** and **Table 355.44** provide the expansion information for polyvinyl chloride (PVC) and for reinforced thermosetting resin conduit (RTRC), respectively. A nominal number for steel conduit can be determined by multiplying the expansion length in **Table 352.44** by 0.20. The coefficient of expansion for steel electrical metallic tubing, intermediate metal conduit, and rigid metal conduit is 1.170×10^{-5} (0.0000117 mm per mm of conduit for each °C in temperature change) [0.650×10^{-5} (0.0000065 in. per inch of conduit for each °F in temperature change)].

A nominal number for aluminum conduit and aluminum electrical metallic tubing can be determined by multiplying the expansion length in **Table 352.44** by 0.40. The coefficient of expansion for aluminum electrical metallic tubing and aluminum rigid metal conduit is 2.34×10^{-5} (0.0000234 mm per mm of conduit for each °C in temperature change) [1.30×10^{-5} (0.000013 in. per inch of conduit for each °F in temperature change)].

Substantial changes in temperature cause destructive amounts of expansion, deflection, and contraction in a raceway system. Properly designed and installed expansion and deflection fittings allow expansion, deflection, and contraction without damage to enclosures, raceways, and their conductors.

The informational note addresses expansion of aluminum RMC and RTRC. The note also provides a few simple relationships (or ratios) of linear expansion in length of PVC conduit to other types of conduit.

The key to determining any temperature-related change in conduit length is understanding that the change in length is equal to the coefficient of expansion of the conduit material times the change in temperature times the initial length of the conduit.

Commentary Table 300.1 provides the coefficient of expansion for various conduit types. This illustrates the variances of different raceway types due to thermal expansion with a 55°F change.

300.8 Installation of Conductors with Other Systems. Raceways or cable trays containing electrical conductors shall not contain any pipe, tube, or equal for steam, water, air, gas, drainage, or any service other than electrical.

300.9 Raceways in Wet Locations Abovegrade. Where raceways are installed in wet locations abovegrade, the interior of these raceways shall be considered to be a wet location. Insulated conductors and cables installed in raceways in wet locations abovegrade shall comply with **310.10(C)**.

300.10 Electrical Continuity of Metal Raceways and Enclosures. Metal raceways, cable armor, and other metal enclosures for conductors shall be metallically joined together into a continuous electrical conductor and shall be connected to all boxes, fittings, and cabinets so as to provide effective electrical continuity. Unless specifically permitted elsewhere in this *Code*, raceways and cable assemblies shall be mechanically secured to boxes, fittings, cabinets, and other enclosures.

Sections 250.4(A) and **(B)** require that the metal parts form an effective low-impedance path to ground. This safely conducts any fault current and facilitates the operation of overcurrent devices protecting the enclosed circuit conductors.

Exception No. 1: Short sections of raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be made electrically continuous.

COMMENTARY TABLE 300.1 Expansion Coefficients with a 55°F Change

Raceway Type	Reference Table	Expansion Coefficient (in./100 ft)	Expansion of 40 ft of raceway (in.)
PVC	352.44	2.23	0.892
RTRC	355.44	0.99	0.396
Steel RMC, IMC, or EMT	352.44	0.446	0.178
	[from 300.7(B) Informational Note]		

Exception No. 2: Equipment enclosures to be isolated, as permitted by 250.96(B), shall not be required to be metallically joined to the metal raceway.

300.11 Securing and Supporting.

(A) Secured in Place. Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place.

(B) Wiring Systems Installed Above Suspended Ceilings.

Support wires that do not provide secure support shall not be permitted as the sole support. Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires shall be permitted as the sole support. Where independent support wires are used, they shall be secured at both ends. Cables and raceways shall not be supported by ceiling grids.

(1) Fire-Rated Assemblies. Wiring located within the cavity of a fire-rated floor–ceiling or roof–ceiling assembly shall not be secured to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided and shall be permitted to be attached to the assembly. Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means from those that are part of the fire-rated design.

Exception: The ceiling support system shall be permitted to support wiring and equipment that have been tested as part of the fire-rated assembly.

Informational Note: One method of determining fire rating is testing in accordance with ANSI/ASTM E119 2015, *Method for Fire Tests of Building Construction and Materials*.

(2) Non-Fire-Rated Assemblies. Wiring located within the cavity of a non-fire-rated floor–ceiling or roof–ceiling assembly shall not be secured to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided and shall be permitted to be attached to the assembly. Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means.

Exception: The ceiling support system shall be permitted to support branch-circuit wiring and associated equipment where installed in accordance with the ceiling system manufacturer's instructions.

Wiring methods and luminaires are not allowed to be supported or secured to the support wires or T-bars of a fire-rated ceiling assembly unless the assembly has been tested and listed for that use. If wire is selected as the supporting means for the electrical system within a fire-rated ceiling cavity, it must be distinguishable from the ceiling support wires by color, tagging, or other effective means and must be secured at both ends. Independent support, and securing both ends of the support wire, do preclude a connection to the ceiling grid on one end.

Generally, the rule for supporting electrical equipment is that the equipment must be “securely fastened in place.” This phrase means not only that vertical support for the weight of the equipment must be provided but also that the equipment must be secured to prevent horizontal movement or sway. The intention is to prevent the loss of grounding continuity provided by the raceway that could result from horizontal movement.

Sections 300.11(B)(1) and (B)(2) are quite similar. Unless the exceptions apply, these sections prohibit all types of wiring from being attached in any way to the support wires of a ceiling assembly or ceiling grid not part of the building structure.

Refer to the appropriate wiring method article in Chapter 3 for cable and raceway supporting requirements.

Article 410, Part IV, for the proper support of luminaires
314.23 for the support of outlet boxes

725.24, 760.24, and 770.24 for various low-voltage fire alarm and optical fiber cable supports

Chapter 8 for requirements on communications systems cable supports

(C) Raceways Used as Means of Support. Raceways shall be used only as a means of support for other raceways, cables, or nonelectrical equipment under any of the following conditions:

- (1) Where the raceway or means of support is identified as a means of support
- (2) Where the raceway contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits
- (3) Where the raceway is used to support boxes or conduit bodies in accordance with 314.23 or to support luminaires in accordance with 410.36(E)

As a general rule, this section prohibits supporting cables by securing them to the exterior of a raceway. Electrical, telephone, and data cables wrapped around a raceway can impede dissipation of heat from the raceway, thus affecting the temperature of the conductors contained in the raceway. The weight from large bundles of cables can compromise the mechanical integrity of the raceway system. For these reasons, this section also prohibits the use of a raceway as a means of support for nonelectrical equipment, such as suspended ceilings, water pipes, and signs.

Class 2 conductors or cables are allowed to be supported by a raceway as long as the power supply conductors are inside the raceway or functionally associated with the attached Class 2 circuit conductors. For example, the thermostat conductors for heating or air-conditioner units are permitted to be supported by the conduit supplying power to the unit. Exhibit 300.12 shows an example of this application, with the Class 2 circuit cables for control of the heating equipment being secured to and supported by the electrical metallic tubing containing the power conductors for the equipment.

(D) Cables Not Used as Means of Support. Cable wiring methods shall not be used as a means of support for other cables, raceways, or nonelectrical equipment.

EXHIBIT 300.12 Raceway used to support Class 2 thermostat cables.

300.12 Mechanical Continuity — Raceways and Cables.

Raceways, cable armors, and cable sheaths shall be continuous between cabinets, boxes, fittings, or other enclosures or outlets.

Exception No. 1: Short sections of raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be mechanically continuous.

Exception No. 2: Raceways and cables installed into the bottom of open bottom equipment such as switchboards, motor control centers, and floor or pad-mounted transformers, shall not be required to be mechanically secured to the equipment.

Exception No. 2 permits raceways and cables to enter equipment from below without actually being attached to the underside of the equipment, if it is constructed with an open-bottom feature. Where metal raceways or cables enter open-bottom-type equipment, electrical continuity between the wiring method and the equipment must be maintained as required by 300.10.

300.13 Mechanical and Electrical Continuity — Conductors.

(A) General. Conductors in raceways shall be continuous between outlets, boxes, devices, and so forth. There shall be no splice or tap within a raceway unless permitted by 300.15; 368.56(A); 376.56; 378.56; 384.56; 386.56; 388.56; or 390.7.

Splices or taps are prohibited within raceways unless the raceways are equipped with hinged or removable covers. Busway conductors are exempt from this requirement. Splices and taps must be accessible according to 300.15.

(B) Device Removal. In multiwire branch circuits, the continuity of a grounded conductor shall not depend on device connections such as lampholders, receptacles, and so forth, where the removal of such devices would interrupt the continuity.

Grounded conductors (neutrals) of multiwire branch circuits supplying receptacles, lampholders, or other devices are not permitted to depend on terminal connections for continuity between devices. For multiwire installations, a splice can be made with a jumper connected to the terminal or the neutral can be looped. This allows a receptacle or device to be replaced without interrupting the continuity of energized downstream line-to-neutral loads. Opening the neutral could cause unbalanced voltages, and a considerably higher voltage would be impressed on one part of a multiwire branch circuit, especially if the downstream line-to-neutral loads were appreciably unbalanced.

300.14 Length of Free Conductors at Outlets, Junctions, and Switch Points.

At least 150 mm (6 in.) of free conductor, measured from the point in the box where it emerges from its raceway or cable sheath, shall be left at each outlet, junction, and switch point for splices or the connection of luminaires or devices. Where the opening to an outlet, junction, or switch point is less than 200 mm (8 in.) in any dimension, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.

Exception: Conductors that are not spliced or terminated at the outlet, junction, or switch point shall not be required to comply with 300.14.

A conductor must have enough slack for the connections to be made easily. The length of slack (free conductor) required for the box size is shown in Exhibit 300.13. The exception excludes conductors running through a box, which should have sufficient slack to prevent physical damage from the insertion of devices or from the use of luminaire studs, hickey, or other luminaire supports within the box.

300.15 Boxes, Conduit Bodies, or Fittings — Where Required.

A box shall be installed at each outlet and switch point for concealed knob-and-tube wiring.

Fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed.

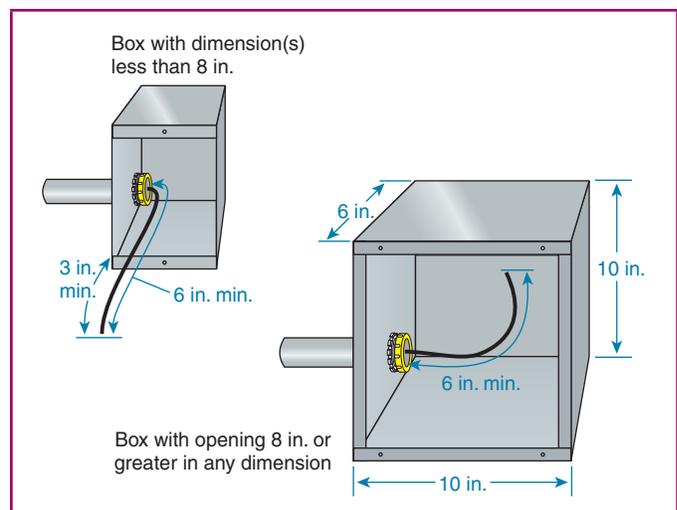

EXHIBIT 300.13 Two different boxes with free conductor lengths.

Where the wiring method is conduit, tubing, Type AC cable, Type MC cable, Type MI cable, nonmetallic-sheathed cable, or other cables, a box or conduit body shall be installed at each conductor splice point, outlet point, switch point, junction point, termination point, or pull point, unless otherwise permitted in 300.15(A) through (L).

(A) Wiring Methods with Interior Access. A box or conduit body shall not be required for each splice, junction, switch, pull, termination, or outlet points in wiring methods with removable covers, such as wireways, multioutlet assemblies, auxiliary gutters, and surface raceways. The covers shall be accessible after installation.

(B) Equipment. An integral junction box or wiring compartment as part of approved equipment shall be permitted in lieu of a box.

(C) Protection. A box or conduit body shall not be required where cables enter or exit from conduit or tubing that is used to provide cable support or protection against physical damage. A fitting shall be provided on the end(s) of the conduit or tubing to protect the cable from abrasion.

(D) Type MI Cable. A box or conduit body shall not be required where accessible fittings are used for straight-through splices in mineral-insulated metal-sheathed cable.

(E) Integral Enclosure. A wiring device with integral enclosure identified for the use, having brackets that securely fasten the device to walls or ceilings of conventional on-site frame construction, for use with nonmetallic-sheathed cable, shall be permitted in lieu of a box or conduit body.

Informational Note: See 334.30(C); 545.10; 550.15(I); 551.47(E), Exception No. 1; and 552.48(E), Exception No. 1.

This requirement applies to a device with an integral enclosure (boxless device) such as the one shown in Exhibit 300.14.

EXHIBIT 300.14 A self-contained device receptacle, which is one example of a boxless device. (Courtesy of Legrand®)

(F) Fitting. A fitting identified for the use shall be permitted in lieu of a box or conduit body where conductors are not spliced or terminated within the fitting. The fitting shall be accessible after installation.

(G) Direct-Buried Conductors. As permitted in 300.5(E), a box or conduit body shall not be required for splices and taps in direct-buried conductors and cables.

(H) Insulated Devices. As permitted in 334.40(B), a box or conduit body shall not be required for insulated devices supplied by nonmetallic-sheathed cable.

(I) Enclosures. A box or conduit body shall not be required where a splice, switch, terminal, or pull point is in a cabinet or cutout box, in an enclosure for a switch or overcurrent device as permitted in 312.8, in a motor controller as permitted in 430.10(A), or in a motor control center.

(J) Luminaires. A box or conduit body shall not be required where a luminaire is used as a raceway as permitted in 410.64.

(K) Embedded. A box or conduit body shall not be required for splices where conductors are embedded as permitted in 424.40, 424.41(D), 426.22(B), 426.24(A), and 427.19(A).

(L) Manholes and Handhole Enclosures. A box or conduit body shall not be required for conductors in manholes or handhole enclosures, except where connecting to electrical equipment. The installation shall comply with the provisions of Part V of Article 110 for manholes, and 314.30 for handhole enclosures.

300.16 Raceway or Cable to Open or Concealed Wiring.

(A) Box, Conduit Body, or Fitting. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made from conduit, electrical metallic tubing, electrical nonmetallic tubing, nonmetallic-sheathed cable, Type AC cable, Type MC cable, or mineral-insulated, metal-sheathed cable and surface raceway wiring to open wiring or to concealed knob-and-tube wiring. A fitting used for this purpose shall contain no taps or splices and shall not be used at luminaire outlets. A conduit body used for this purpose shall contain no taps or splices, unless it complies with 314.16(C)(2).

A fitting is permitted instead of a box where a cable system transitions to a raceway to protect it against physical damage. For example, when a nonmetallic-sheathed cable runs overhead on floor joists then needs protection where it drops down on a masonry wall to supply a receptacle, a short length of raceway is installed to the outlet device box. The cable is then inserted in the raceway and secured by a combination fitting that is fastened to the end of the raceway.

(B) Bushing. A bushing shall be permitted in lieu of a box or terminal where the conductors emerge from a raceway and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or similar equipment. The bushing shall be of the insulating type for other than lead-sheathed conductors.

300.17 Number and Size of Conductors in Raceway. The number and size of conductors in any raceway shall not be more than will permit dissipation of the heat and ready installation or withdrawal of the conductors without damage to the conductors or to their insulation.

Informational Note: See the following sections of this Code: intermediate metal conduit, 342.22; rigid metal conduit, 344.22; flexible metal conduit, 348.22; liquidtight flexible metal conduit, 350.22; PVC conduit, 352.22; HDPE conduit, 353.22; RTRC, 355.22; liquidtight nonmetallic flexible conduit, 356.22; electrical metallic tubing, 358.22; flexible metallic tubing, 360.22; electrical nonmetallic tubing, 362.22; cellular concrete floor raceways, 372.22; cellular metal floor raceways, 374.22; metal wireways, 376.22; nonmetallic wireways, 378.22; surface metal raceways, 386.22; surface nonmetallic raceways, 388.22; under-floor raceways, 390.6; fixture wire, 402.7; theaters, 520.6; signs, 600.31(C); elevators, 620.33; audio signal processing, amplification, and reproduction equipment, 640.23(A) and 640.24; Class 1, Class 2, and Class 3 circuits, Article 725; fire alarm circuits, Article 760; and optical fiber cables and raceways, Article 770.

300.18 Raceway Installations.

(A) Complete Runs. Raceways, other than busways or exposed raceways having hinged or removable covers, shall be installed complete between outlet, junction, or splicing points prior to the installation of conductors. Where required to facilitate the installation of utilization equipment, the raceway shall be permitted to be initially installed without a terminating connection at the equipment. Prewired raceway assemblies shall be permitted only where specifically permitted in this Code for the applicable wiring method.

Exception Short sections of raceways used to contain conductors or cable assemblies for protection from physical damage shall not be required to be installed complete between outlet, junction, or splicing points.

One of the primary functions of a raceway is to provide physical protection for conductors. If raceways are incomplete at the time of conductor installation, a greater possibility of damage to the conductors exists.

The installation of conductors in an incomplete raceway is permitted for connection of utilization equipment. The motor installation

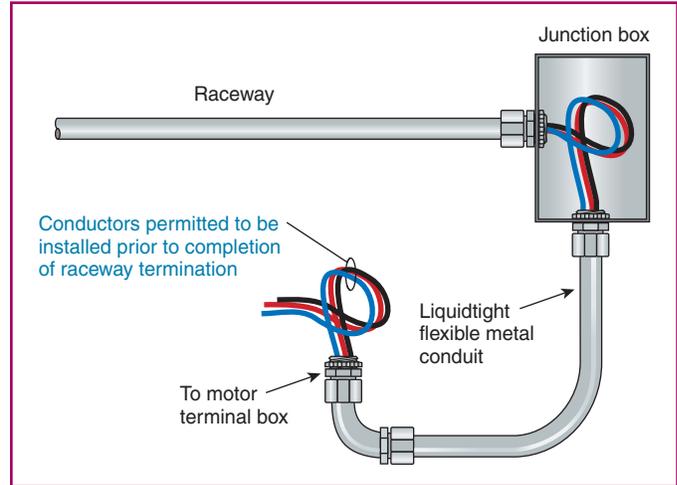

EXHIBIT 300.15 The conductors supplying a motor through LFM are permitted to be installed prior to the connection of the raceway to the motor terminal box.

shown in Exhibit 300.15 is a typical example, where the motor will be supplied through liquidtight flexible metal conduit that terminates in the motor terminal box through a 90-degree angle connector. Wiring a luminaire whip prior to connecting a luminaire is also permitted by this section.

(B) Welding. Metal raceways shall not be supported, terminated, or connected by welding to the raceway unless specifically designed to be or otherwise specifically permitted to be in this Code.

300.19 Supporting Conductors in Vertical Raceways.

(A) Spacing Intervals — Maximum. Conductors in vertical raceways shall be supported if the vertical rise exceeds the values in Table 300.19(A). At least one support method shall be provided for each conductor at the top of the vertical raceway or as close to the top as practical. Intermediate supports shall be provided as necessary to limit supported conductor lengths to not greater than those values specified in Table 300.19(A).

TABLE 300.19(A) Spacings for Conductor Supports

Conductor Size	Support of Conductors in Vertical Raceways	Conductors			
		Aluminum or Copper-Clad Aluminum		Copper	
		m	ft	m	ft
18 AWG through 8 AWG	Not greater than	30	100	30	100
6 AWG through 1/0 AWG	Not greater than	60	200	30	100
2/0 AWG through 4/0 AWG	Not greater than	55	180	25	80
Over 4/0 AWG through 350 kcmil	Not greater than	41	135	18	60
Over 350 kcmil through 500 kcmil	Not greater than	36	120	15	50
Over 500 kcmil through 750 kcmil	Not greater than	28	95	12	40
Over 750 kcmil	Not greater than	26	85	11	35

Exception: Steel wire armor cable shall be supported at the top of the riser with a cable support that clamps the steel wire armor. A safety device shall be permitted at the lower end of the riser to hold the cable in the event there is slippage of the cable in the wire-armored cable support. Additional wedge-type supports shall be permitted to relieve the strain on the equipment terminals caused by expansion of the cable under load.

This requirement prevents the weight of the conductors from damaging the insulation where they leave the conduit and prevents the conductors from being pulled out of the terminals. Support bushings or cleats such as those shown in Exhibits 300.16 and 300.17 may be used, in addition to many other types of grips manufactured for this purpose.

EXHIBIT 300.16 A support bushing, located at the top of a vertical conduit at a cabinet or pull box, used to prevent the weight of the conductors from damaging insulation or placing strain on termination points.

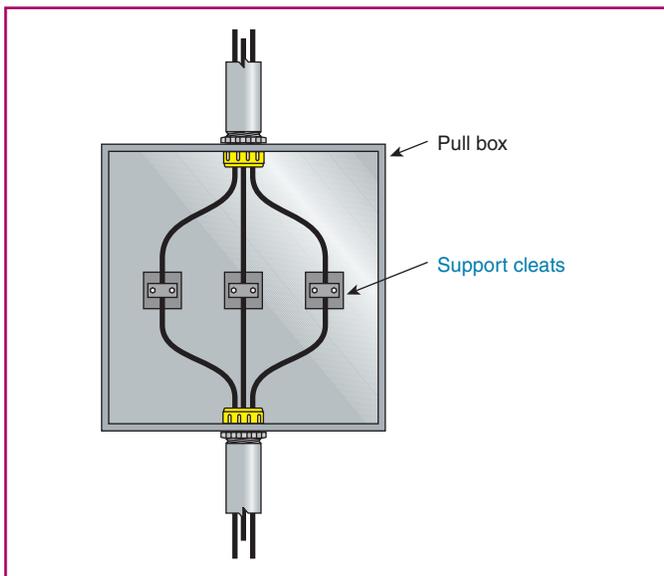

EXHIBIT 300.17 Support cleats used to prevent the weight of vertical conductors from damaging insulation or placing strain on termination points.

(B) Fire-Rated Cables and Conductors. Support methods and spacing intervals for fire-rated cables and conductors shall comply with any restrictions provided in the listing of the electrical circuit protective system used and in no case shall exceed the values in Table 300.19(A).

(C) Support Methods. One of the following methods of support shall be used:

- (1) By clamping devices constructed of or employing insulating wedges inserted in the ends of the raceways. Where clamping of insulation does not adequately support the cable, the conductor also shall be clamped.
- (2) By inserting boxes at the required intervals in which insulating supports are installed and secured in an approved manner to withstand the weight of the conductors attached thereto, the boxes being provided with covers.
- (3) In junction boxes, by deflecting the cables not less than 90 degrees and carrying them horizontally to a distance not less than twice the diameter of the cable, the cables being carried on two or more insulating supports and additionally secured thereto by tie wires if desired. Where this method is used, cables shall be supported at intervals not greater than 20 percent of those mentioned in the preceding tabulation.
- (4) By other approved means.

300.20 Induced Currents in Ferrous Metal Enclosures or Ferrous Metal Raceways.

(A) Conductors Grouped Together. Where conductors carrying alternating current are installed in ferrous metal enclosures or ferrous metal raceways, they shall be arranged so as to avoid heating the surrounding ferrous metal by induction. To accomplish this, all phase conductors and, where used, the grounded conductor and all equipment grounding conductors shall be grouped together.

Exception No. 1: Equipment grounding conductors for certain existing installations shall be permitted to be installed separate from their associated circuit conductors where run in accordance with the provisions of 250.130(C).

Exception No. 2: A single conductor shall be permitted to be installed in a ferromagnetic enclosure and used for skin-effect heating in accordance with the provisions of 426.42 and 427.47.

Nonferrous metals are defined as those with little or no iron in their composition. Some of the more common nonferrous (nonmagnetic) metals include aluminum, brass, bronze, copper, lead, tin, and zinc. Section 300.20(A) addresses the problem of induction from ac conductors into ferrous (magnetic) metal enclosures and ferrous raceways. Induction into raceways and enclosures can lead to overheating and is also a shock hazard.

(B) Individual Conductors. Where a single conductor carrying alternating current passes through metal with magnetic properties, the inductive effect shall be minimized by (1) cutting slots in the metal between the individual holes through which

the individual conductors pass or (2) passing all the conductors in the circuit through an insulating wall sufficiently large for all of the conductors of the circuit.

Exception: In the case of circuits supplying vacuum or electric-discharge lighting systems or signs or X-ray apparatus, the currents carried by the conductors are so small that the inductive heating effect can be ignored where these conductors are placed in metal enclosures or pass through metal.

Informational Note: Because aluminum is not a magnetic metal, there will be no heating due to hysteresis; however, induced currents will be present. They will not be of sufficient magnitude to require grouping of conductors or special treatment in passing conductors through aluminum wall sections.

300.21 Spread of Fire or Products of Combustion. Electrical installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around electrical penetrations into or through fire-resistant walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Informational Note: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance-rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 300.21 can be found in building codes, fire resistance directories, and product listings.

Cables, cable trays, and raceways must be installed through fire-rated walls, floors, and ceiling assemblies using an approved firestop method so that they do not contribute to the spread of fire or the products of combustion. In the *UL Guide Information for Electrical Equipment — The White Book*, Category XHEZ covers through-penetration firestop systems and Category XHLI covers firestop devices. These two category sections provide valuable information concerning application, installation, and use of firestop systems and firestop devices. A firestop system, the seals for which are shown in Exhibit 300.18, meets the requirements of 300.21.

Using the proper protection techniques is crucial in limiting or stopping flame, excessive temperature, and smoke from passing through fire-rated construction. Sleeves for the protection of cables passing through fire-rated construction must be firestopped to the original rating of the assembly both around the sleeve and around the cables inside the sleeve.

The structural integrity of the floor or wall assembly needs to be evaluated when providing openings for the penetrating items. The rating of the building assembly being penetrated by electrical cables or conduits must also be determined. This information is available from construction documents or building codes. Once the fire resistance rating has been determined, the properties and types of electrical penetration required [whether metal or nonmetallic cable(s) or conduit(s) or even cable trays] must be determined. Next, the selected method of firestopping must be approved by the AHJ. Building codes generally

EXHIBIT 300.18 Fire seals used in a through-penetration firestop system to maintain the fire resistance rating of the wall. (Courtesy of O-Z/Gedney, a division of EGS Electrical Group)

require that a firestop system or device be tested. ASTM E814-2013, *Standard Test Method for Fire Tests of Penetration Firestop Systems*, and ANSI/UL 1479-2015, *Fire Tests of Penetration Firestops*, are two examples of such test methods. Certain construction practices can be used in lieu of tested systems or devices. NFPA 221, *Standard for High Challenge Fire Walls, Fire Walls, and Fire Barrier Walls*, as well as some building codes, contains a statement somewhat similar to the following:

Where concrete, grout, or mortar has been used to fill the annular spaces around . . . steel conduit or tubing that penetrates one or more concrete or masonry walls, the nominal diameter of each penetrating item shall not exceed 6 in., the opening size shall not exceed 144 in.² and the thickness of the concrete, grout, or mortar shall be the full thickness of the assembly

300.22 Wiring in Ducts Not Used for Air Handling, Fabricated Ducts for Environmental Air, and Other Spaces for Environmental Air (Plenums). The provisions of this section shall apply to the installation and uses of electrical wiring and equipment in ducts used for dust, loose stock, or vapor removal; ducts specifically fabricated for environmental air; and other spaces used for environmental air (plenums).

Informational Note: See Article 424, Part VI, for duct heaters.

Other codes and standards refer to all spaces that move air as plenums, including spaces that the NEC identifies as “other spaces.” Some of the terms used to describe this space include plenum, ceiling cavity plenum, and raised floor plenum. Products are often required to be marked as “suitable for use in other spaces for environmental air” or equivalent language to comply with requirements in the NEC.

Section 300.22(B) addresses ducts and spaces used solely for the movement of environmental air. The term *plenum* appears with *other spaces used for environmental air* to make it clear that it applies to structures that are not fabricated specifically to handle environmental air as the primary purpose, but handle the air nonetheless.

(A) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system

of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment.

(B) Ducts Specifically Fabricated for Environmental Air. Equipment, devices, and the wiring methods specified in this section shall be permitted within such ducts only if necessary for the direct action upon, or sensing of, the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires shall be permitted.

Only wiring methods consisting of Type MI cable without an overall nonmetallic covering, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit without an overall nonmetallic covering shall be installed in ducts specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1.2 m (4 ft), to connect physically adjustable equipment and devices permitted to be in these fabricated ducts. The connectors used with flexible metal conduit shall effectively close any openings in the connection.

Exception: Wiring methods and cabling systems, listed for use in other spaces used for environmental air (plenums), shall be permitted to be installed in ducts specifically fabricated for environmental air-handling purposes under the following conditions:

- (1) The wiring methods or cabling systems shall be permitted only if necessary to connect to equipment or devices associated with the direct action upon or sensing of the contained air, and
- (2) The total length of such wiring methods or cabling systems shall not exceed 1.2 m (4 ft).

The use of wiring methods within ducts is limited to minimize the contribution of smoke and products of combustion during a fire in an area that handles environmental air.

(C) Other Spaces Used for Environmental Air (Plenums). This section shall apply to spaces not specifically fabricated for environmental air-handling purposes but used for air-handling purposes as a plenum. This section shall not apply to habitable rooms or areas of buildings, the prime purpose of which is not air handling.

Informational Note No. 1: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Informational Note No. 2: The phrase “Other Spaces Used for Environmental Air (Plenum)” as used in this section correlates with the use of the term “plenum” in NFPA 90A-2015, *Standard for the Installation of Air-Conditioning and Ventilating Systems*, and other mechanical codes where the plenum is used for return air purposes, as well as some other air-handling spaces.

Other spaces or plenums — such as the space or cavity between a structural floor or roof and a suspended (hung) ceiling — are used to

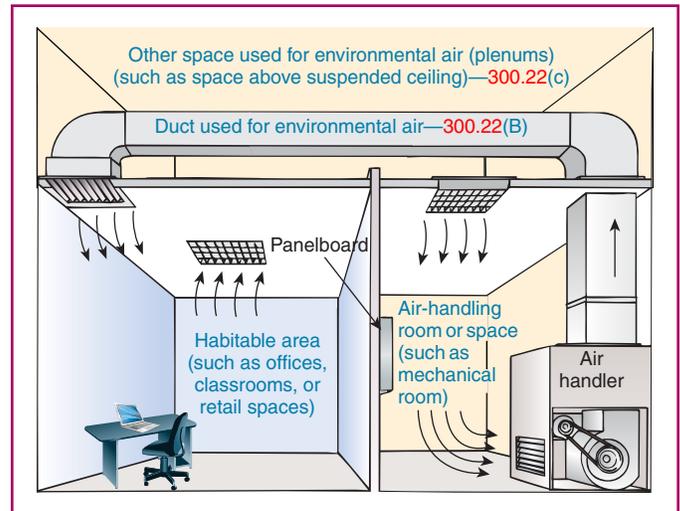

EXHIBIT 300.19 An example of spaces used for environmental air.

transport environmental air and are not specifically manufactured as ducts. Many spaces above suspended ceilings are intended to transport return air. Informational Note No. 2 correlates the term *other spaces used with environmental air* with the term *plenum* as used in NFPA 90A, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.

Exhibit 300.19 illustrates the distinction between a habitable room and one used for air handling. If the prime purpose of the room or space is air handling, the restrictions in 300.22(C) apply.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

This exception permits cable to pass through joist or stud spaces of a dwelling unit, where the joist space is used as a return for a forced-air central heating or air-conditioning system. As shown in Exhibit 300.20, the joist space is covered with appropriate material, and the cable passes through the space perpendicular to the vertical run.

(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated

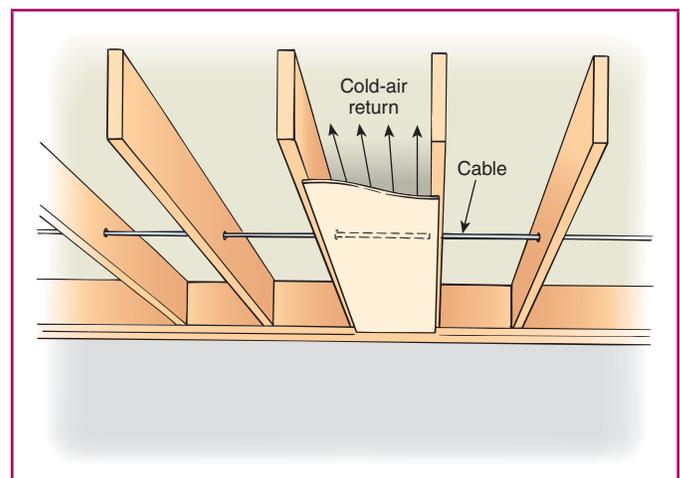

EXHIBIT 300.20 A cable passing through joist spaces of a dwelling unit.

busway having no provisions for plug-in connections, Type MI cable without an overall nonmetallic covering, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for use within an air-handling space, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables, conductors, and raceways shall be permitted to be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers.

Nonmetallic cable ties and other nonmetallic cable accessories used to secure and support cables shall be listed as having low smoke and heat release properties.

Informational Note: One method to determine low smoke and heat release properties is that the nonmetallic cable ties and other nonmetallic cable accessories exhibit a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested in accordance with ANSI/UL 2043-2008, *Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces*.

(2) Cable Tray Systems. The provisions in (a) or (b) shall apply to the use of metallic cable tray systems in other spaces used for environmental air (plenums), where accessible, as follows:

(a) *Metal Cable Tray Systems.* Metal cable tray systems shall be permitted to support the wiring methods in 300.22(C)(1).

(b) *Solid Side and Bottom Metal Cable Tray Systems.* Solid side and bottom metal cable tray systems with solid metal covers shall be permitted to enclose wiring methods and cables, not already covered in 300.22(C)(1), in accordance with 392.10(A) and (B).

(3) Equipment. Electrical equipment with a metal enclosure, or electrical equipment with a nonmetallic enclosure listed for use within an air-handling space and having low smoke and heat release properties, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this *Code*.

Informational Note: One method to determine low smoke and heat release properties is that the equipment exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100kW or less when tested in accordance with ANSI/UL 2043-2013, *Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces*.

Exception: Integral fan systems shall be permitted where specifically identified for use within an air-handling space.

(D) Information Technology Equipment. Electrical wiring in air-handling areas beneath raised floors for information technology equipment shall be permitted in accordance with Article 645.

The requirements of 300.22(B) or (C) are not intended to apply to air-handling areas beneath raised floors in information technology equipment rooms that meet the requirements specified in Article 645.

See also

Article 645 for more information on information technology equipment

300.23 Panels Designed to Allow Access. Cables, raceways, and equipment installed behind panels designed to allow access, including suspended ceiling panels, shall be arranged and secured so as to allow the removal of panels and access to the equipment.

Part II. Requirements for over 1000 Volts, Nominal

300.31 Covers Required. Suitable covers shall be installed on all boxes, fittings, and similar enclosures to prevent accidental contact with energized parts or physical damage to parts or insulation.

300.32 Conductors of Different Systems. See 300.3(C)(2).

300.34 Conductor Bending Radius. The conductor shall not be bent to a radius less than 8 times the overall diameter for nonshielded conductors or 12 times the overall diameter for shielded or lead-covered conductors during or after installation. For multiconductor or multiplexed single-conductor cables having individually shielded conductors, the minimum bending radius is 12 times the diameter of the individually shielded conductors or 7 times the overall diameter, whichever is greater.

300.35 Protection Against Induction Heating. Metallic raceways and associated conductors shall be arranged so as to avoid heating of the raceway in accordance with the applicable provisions of 300.20.

300.37 Aboveground Wiring Methods. Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in electrical metallic tubing, in RTRC and PVC conduit, in cable trays, in auxiliary gutters, as busways, as cable-bus, in other identified raceways, or as exposed runs of metal-clad cable suitable for the use and purpose. In locations accessible to qualified persons only, exposed runs of Type MV cables, bare conductors, and bare busbars shall also be permitted. Busbars shall be permitted to be either copper or aluminum.

Exception: Airfield lighting cable used in series circuits that are powered by regulators and installed in restricted airport lighting vaults shall be permitted as exposed cable installations.

Informational Note: FAA L-824 cables installed as exposed runs within a restricted vault area are common applications.

300.38 Raceways in Wet Locations Above Grade. Where raceways are installed in wet locations above grade, the interior of these raceways shall be considered to be a wet location. Insulated conductors and cables installed in raceways in wet locations above grade shall comply with 310.10(C).

300.39 Braid-Covered Insulated Conductors — Exposed Installation. Exposed runs of braid-covered insulated conductors shall have a flame-retardant braid. If the conductors used do not have this protection, a flame-retardant saturant shall be applied to the braid covering after installation. This treated braid covering shall be stripped back a safe distance at conductor terminals, according to the operating voltage. Where practicable, this distance shall not be less than 25 mm (1 in.) for each kilovolt of the conductor-to-ground voltage of the circuit.

300.40 Insulation Shielding. Metallic and semiconducting insulation shielding components of shielded cables shall be removed for a distance dependent on the circuit voltage and insulation. Stress reduction means shall be provided at all terminations of factory-applied shielding.

Metallic shielding components such as tapes, wires, or braids, or combinations thereof, shall be connected to a grounding conductor, grounding busbar, or a grounding electrode.

300.42 Moisture or Mechanical Protection for Metal-Sheathed Cables. Where cable conductors emerge from a metal sheath and where protection against moisture or physical damage is necessary, the insulation of the conductors shall be protected by a cable sheath terminating device.

300.45 Warning Signs. Warning signs shall be conspicuously posted at points of access to conductors in all conduit systems and cable systems. The warning sign(s) shall be legible and permanent and shall carry the following wording:

DANGER—HIGH VOLTAGE—KEEP OUT

300.50 Underground Installations.

(A) General. Underground conductors shall be identified for the voltage and conditions under which they are installed. Direct-burial cables shall comply with the provisions of 310.10(F). Underground cables shall be installed in accordance with 300.50(A)(1), (A)(2), or (A)(3), and the installation shall meet the depth requirements of Table 300.50.

Prior to backfilling a ditch or trench, a warning ribbon must be placed near underground direct-buried conductors over 1000 volts, nominal, that are not encased in concrete, in accordance with Table 300.50, Footnote b. This requirement is intended to reduce the risk of an accident, electrocution, or arc-flash incident during excavation.

(1) Shielded Cables and Nonshielded Cables in Metal-Sheathed Cable Assemblies. Underground cables, including nonshielded, Type MC and moisture-impervious metal sheath cables, shall have those sheaths grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or (B)(4). They shall be direct buried or installed in raceways identified for the use.

(2) Industrial Establishments. In industrial establishments, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable, nonshielded

single-conductor cables with insulation types up to 2000 volts that are listed for direct burial shall be permitted to be directly buried.

(3) Other Nonshielded Cables. Other nonshielded cables not covered in 300.50(A)(1) or (A)(2) shall be installed in rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit encased in not less than 75 mm (3 in.) of concrete.

(B) Wet Locations. The interior of enclosures or raceways installed underground shall be considered to be a wet location. Insulated conductors and cables installed in these enclosures or raceways in underground installations shall be listed for use in wet locations and shall comply with 310.10(C). Any connections or splices in an underground installation shall be approved for wet locations.

The inside of all raceways and enclosures installed underground is classified as a wet location. Conductors installed in such underground locations must be listed for use in wet locations and comply with 310.10(C).

(C) Protection from Damage. Conductors emerging from the ground shall be enclosed in listed raceways. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, RTRC-XW, Schedule 80 PVC conduit, or equivalent, extending from the minimum cover depth specified in Table 300.50 to a point 2.5 m (8 ft) above finished grade. Conductors entering a building shall be protected by an approved enclosure or raceway from the minimum cover depth to the point of entrance. Where direct-buried conductors, raceways, or cables are subject to movement by settlement or frost, they shall be installed to prevent damage to the enclosed conductors or to the equipment connected to the raceways. Metallic enclosures shall be grounded.

(D) Splices. Direct burial cables shall be permitted to be spliced or tapped without the use of splice boxes, provided they are installed using materials suitable for the application. The taps and splices shall be watertight and protected from mechanical damage. Where cables are shielded, the shielding shall be continuous across the splice or tap.

Exception: At splices of an engineered cabling system, metallic shields of direct-buried single-conductor cables with maintained spacing between phases shall be permitted to be interrupted and overlapped. Where shields are interrupted and overlapped, each shield section shall be grounded at one point.

(E) Backfill. Backfill containing large rocks, paving materials, cinders, large or sharply angular substances, or corrosive materials shall not be placed in an excavation where materials can damage or contribute to the corrosion of raceways, cables, or other substructures or where it may prevent adequate compaction of fill.

Protection in the form of granular or selected material or suitable sleeves shall be provided to prevent physical damage to the raceway or cable.

(F) Raceway Seal. Where a raceway enters from an underground system, the end within the building shall be sealed with an identified compound so as to prevent the entrance of moisture or gases, or it shall be so arranged to prevent moisture from contacting live parts.

TABLE 300.50 Minimum Cover^a Requirements

Circuit Voltage	General Conditions (not otherwise specified)						Special Conditions (use if applicable)					
	Column 1		Column 2		Column 3		Column 4		Column 5		Column 6	
	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.
	Direct-Buried Cables ^b		RTRC, PVC, and HDPE Conduit ^c		Rigid Metal Conduit and Intermediate Metal Conduit		Raceways Under Buildings or Exterior Concrete Slabs, 100 mm (4 in.) Minimum Thickness ^d		Cables in Airport Runways or Adjacent Areas Where Trespass Is Prohibited		Areas Subject to Vehicular Traffic, Such as Thoroughfares and Commercial Parking Areas	
Over 1000 V through 22 kV	750	30	450	18	150	6	100	4	450	18	600	24
Over 22 kV through 40 kV	900	36	600	24	150	6	100	4	450	18	600	24
Over 40 kV	1000	42	750	30	150	6	100	4	450	18	600	24

General Notes:

1. Lesser depths shall be permitted where cables and conductors rise for terminations or splices or where access is otherwise required.
2. Where solid rock prevents compliance with the cover depths specified in this table, the wiring shall be installed in a metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm (2 in.) of concrete extending down to rock.
3. In industrial establishments, where conditions of maintenance and supervision ensure that qualified persons will service the installation, the minimum cover requirements, for other than rigid metal conduit and intermediate metal conduit, shall be permitted to be reduced 150 mm (6 in.) for each 50 mm (2 in.) of concrete or equivalent placed entirely within the trench over the underground installation.

Specific Footnotes:

^aCover is defined as the shortest distance in millimeters (inches) measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade concrete or similar cover.

^bUnderground direct-buried cables that are not encased or protected by concrete and are buried 750 mm (30 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the cables.

^cListed by a qualified testing agency as suitable for direct burial without encasement. All other nonmetallic systems shall require 50 mm (2 in.) of concrete or equivalent above conduit in addition to the table depth.

^dThe slab shall extend a minimum of 150 mm (6 in.) beyond the underground installation, and a warning ribbon or other effective means suitable for the conditions shall be placed above the underground installation.

Part I. General

310.1 Scope. This article covers general requirements for conductors and their type designations, insulations, markings, mechanical strengths, ampacity ratings, and uses. These requirements do not apply to conductors that form an integral part of equipment, such as motors, motor controllers, and similar equipment, or to conductors specifically provided for elsewhere in this *Code*.

Informational Note: For flexible cords and cables, see [Article 400](#). For fixture wires, see [Article 402](#).

310.2 Definitions.

Electrical Ducts. Electrical conduits, or other raceways round in cross section, that are suitable for use underground or embedded in concrete.

Thermal Resistivity. As used in this *Code*, the heat transfer capability through a substance by conduction

Informational Note: Thermal resistivity is the reciprocal of thermal conductivity and is designated Rho, which is expressed in the units °C-cm/W.

Part II. Installation

310.10 Uses Permitted. The conductors described in [310.104](#) shall be permitted for use in any of the wiring methods covered in [Chapter 3](#) and as specified in their respective tables or as permitted elsewhere in this *Code*.

(A) Dry Locations. Insulated conductors and cables used in dry locations shall be any of the types identified in this *Code*.

(B) Dry and Damp Locations. Insulated conductors and cables used in dry and damp locations shall be Types FEP, FEPB, MTW, PFA, RHH, RHW, RHW-2, SA, THHN, THW, THW-2, THHW, THWN, THWN-2, TW, XHH, XHHW, XHHW-2, Z, or ZW.

(C) Wet Locations. Insulated conductors and cables used in wet locations shall comply with one of the following:

- (1) Be moisture-impervious metal-sheathed
- (2) Be types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THWN, THWN-2, XHHW, XHHW-2, or ZW
- (3) Be of a type listed for use in wet locations

(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with (D)(1) or (D)(2):

- (1) Conductors and cables shall be listed, or listed and marked, as being sunlight resistant
- (2) Conductors and cables shall be covered with insulating material, such as tape or sleeving, that is listed, or listed and marked, as being sunlight resistant

(E) Shielding. Nonshielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in Type MC cables in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to a grounding electrode conductor, a grounding busbar, an equipment grounding conductor, or a grounding electrode.

The construction of metal-armored cable provides enhanced reliability because the conductors have a concentric lay-orientation and their insulation is protected from damage during installation. Nonshielded conductors within metal raceways do not provide the same level of reliability. Conductors-into-conduit installation is inconsistent and cannot guarantee insulation will not be damaged nor that cables will be in concentric lay orientation.

Solid dielectric insulated conductors that are permanently installed and that operate at greater than 2000 volts are required to have ozone-resistant insulation and must be shielded with a grounded metallic shield. Shielding is accomplished by applying a metal tape or nonmetallic semiconducting tape around the conductor surface to prevent corona from forming and to reduce high-voltage stresses.

Corona is a faint glow adjacent to the surface of the electrical conductor at high voltage. If high-voltage stresses and a charging current are flowing between the conductor and ground (usually due to moisture), the surrounding atmosphere is ionized, and ozone — generated by an electric discharge in ordinary oxygen or air — is formed and will attack the conductor jacket and insulation, eventually breaking them down. The shield is at ground potential; therefore, no voltage above ground is present on the jacket outside the shield, thus preventing a discharge from the jacket and the subsequent formation of ozone.

[Exhibits 310.1](#) and [310.2](#) illustrate shielded cable installations: a three-conductor cable of the shielded type, a stress-relief cone for an indoor cable terminator, and a stress cone on a single-conductor shielded cable terminating inside a pothead. In [Exhibit 310.2](#) (right), a clamping ring provides a grounding connection between the copper shielding tape and the shield to the metallic base of the pothead.

Informational Note: The primary purposes of shielding are to confine the voltage stresses to the insulation, dissipate insulation leakage current, drain off the capacitive charging current, and carry ground-fault current to facilitate operation of ground-fault protective devices in the event of an electrical cable fault.

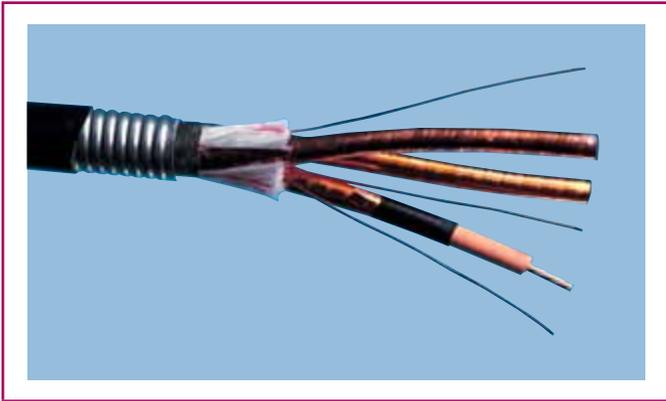

EXHIBIT 310.1 A three-conductor cable of the shielded type.

EXHIBIT 310.2 (Left) A one-piece, premolded stress-relief cone for indoor cable terminations of up to 35 kilovolts phase-to-phase. (Right) A stress cone on a single-conductor shielded cable terminating inside a pothead.

Exception No. 1: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2400 volts under the following conditions:

- Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.*
- Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.*
- Insulation and jacket thicknesses shall be in accordance with [Table 310.104\(D\)](#).*

Exception No. 2: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts to replace existing nonshielded conductors, on existing equipment in industrial establishments only, under the following conditions:

- Where the condition of maintenance and supervision ensures that only qualified personnel install and service the installation.*
- Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.*
- Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.*
- Insulation and jacket thicknesses shall be in accordance with [Table 310.104\(D\)](#).*

Informational Note: Relocation or replacement of equipment may not comply with the term existing as related to this exception.

Where cable in an existing installation requires replacement, it may be preferable to replace a nonshielded cable with another nonshielded cable where existing raceways and termination enclosures do not provide adequate space for shielded conductors and their associated terminations.

Federal Aviation Administration Advisory Circulars for airfield lighting cable permit certain circuits up to 5 kilovolts to be unshielded. Permitted uses of nonshielded cable in airfield lighting are provided in [310.10\(F\)](#), Exception No. 2.

Specialized training and close adherence to manufacturers' instructions are essential for high-voltage cable installations.

Exception No. 3: Where permitted in [310.10\(F\)](#), Exception No. 2.

(F) Direct-Burial Conductors. Conductors used for direct-burial applications shall be of a type identified for such use.

Cables rated above 2000 volts shall be shielded.

Exception No. 1: Nonshielded multiconductor cables rated 2001–2400 volts shall be permitted if the cable has an overall metallic sheath or armor.

The metallic shield, sheath, or armor shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode.

Exception No. 2: Airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by regulators shall be permitted to be nonshielded.

Informational Note to Exception No. 2: Federal Aviation Administration (FAA) Advisory Circulars (ACs) provide additional practices and methods for airport lighting.

Informational Note No. 1: See [300.5](#) for installation requirements for conductors rated 1000 volts or less.

Informational Note No. 2: See [300.50](#) for installation requirements for conductors rated over 1000 volts.

(G) Corrosive Conditions. Conductors exposed to oils, greases, vapors, gases, fumes, liquids, or other substances having a deleterious effect on the conductor or insulation shall be of a type suitable for the application.

Nylon-jacketed conductors, such as Type THWN, are suitable for use where exposed to gasoline. The *UL Guide Information for Electrical Equipment — The White Book* states in the category for Thermoplastic-Insulated Wire (ZLGR) in part:

THWN — wire that is suitable for exposure to mineral oil, and to liquid gasoline and gasoline vapors at ordinary ambient temperature, is marked “Gasoline and Oil Resistant I” if suitable for exposure to mineral oil at 60°C, or “Gasoline and Oil Resistant II” if the compound is suitable for exposure to mineral oil at 75°C. Gasoline-resistant wire has been tested at 23°C when immersed in gasoline and is considered inherently resistant to gasoline vapors within the limits of the temperature rating of the wire type.

Before using a wire-pulling compound, it should first be investigated to determine compliance with 310.10(G).

(H) Conductors in Parallel.

(1) General. Aluminum, copper-clad aluminum, or copper conductors, for each phase, polarity, neutral, or grounded circuit shall be permitted to be connected in parallel (electrically joined at both ends) only in sizes 1/0 AWG and larger where installed in accordance with 310.10(H)(2) through (H)(6).

Conductors connected in parallel are treated by the *NEC*® as a single conductor with a total cross-sectional area of all conductors in parallel. The use of parallel conductors is a practical and cost-effective means of installing large-capacity feeders or services. Using conductors larger than 1000 kcmil in raceways is neither economical nor practical unless the conductor size is governed by voltage drop. The ampacity of larger sizes of conductors would increase very little in proportion to the increase in the size of the conductor. Where the cross-sectional area of a conductor increases 50 percent (e.g., from 1000 to 1500 kcmil), a Type THW conductor ampacity increases only 80 amperes (less than 15 percent). A 100-percent increase (from 1000 to 2000 kcmil) causes an increase of only 120 amperes (approximately 22 percent). Generally, where cost is a factor, installation of two (or more) paralleled conductors per phase may be beneficial.

The parallel connection of two or more conductors in place of using one large conductor depends on compliance with 310.10(H)(2) to ensure equal current division in order to prevent overloading any of the individual paralleled conductors.

Where individual conductors are tapped from conductors in parallel, the tap connection must include all the conductors in parallel for that particular phase. Tapping into only one of the parallel conductors would result in unbalanced distribution of tap load current between parallel conductors, resulting in one of the conductors carrying more than its share of the load, which could cause overheating and conductor insulation failure. For example, if a 250-kcmil conductor is tapped from a set of two 500-kcmil conductors in parallel, the splicing device must include both 500-kcmil conductors and the single 250-kcmil tap conductor.

Exception No. 1: Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power

to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:

- (a) *They are contained within the same raceway or cable.*
- (b) *The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.*
- (c) *The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.*

In control wiring and circuits that operate at frequencies greater than 360 Hz, a reduction of cable capacitance or voltage drop in long lengths of wire may be necessary. A 14 AWG conductor might have more than sufficient capacity to carry the load, but by installing two conductors in parallel, the voltage drop can be reduced to acceptable limits. The presence of the word *polarity* in 310.10(H)(1) specifically allows the inclusion of dc circuits.

Exception No. 2: Under engineering supervision, 2 AWG and 1 AWG grounded neutral conductors shall be permitted to be installed in parallel for existing installations.

Informational Note to Exception No. 2: Exception No. 2 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

The word *triplen* refers to a third-order harmonic current, such as the third, sixth, ninth, and so on. The concern is limited to odd-number triplen harmonic currents, such as the third, ninth, and fifteenth, since these are additive currents in the neutral conductor and they do not cancel.

See also

Chapter 10 of NFPA 70B, *Recommended Practice for Electrical Equipment Maintenance*, for additional information on power quality and harmonics

(2) Conductor and Installation Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, equipment grounding conductor, or equipment bonding jumper shall comply with all of the following:

- (1) Be the same length.
- (2) Consist of the same conductor material.
- (3) Be the same size in circular mil area.
- (4) Have the same insulation type.
- (5) Be terminated in the same manner.

In order to avoid excessive voltage drop and also to ensure equal division of current, different phase conductors must be located close together. Each phase conductor, grounded conductor, and the grounding conductor (if used) must also be grouped together in each raceway or cable. However, isolated phase installations are permitted underground where the phase conductors are run in nonmetallic raceways that are in close proximity.

All conductors of the same phase or neutral are required by 310.10(H)(2) to be of the same conductor material. For example, if 12 conductors are paralleled for a 3-phase, 4-wire, 480Y/277-volt ac

circuit, 4 conductors could be installed in each of three raceways. The NEC does not intend that all 12 conductors be copper or aluminum but does intend that the individual conductors in parallel for each phase, grounded conductor, and neutral be the same material, insulation type, length, and so forth. For example, the conductors in phases A and B may be copper, and those in phase C may be aluminum. Also, the three raceways are intended to have the same physical characteristics (e.g., three rigid aluminum conduits, three steel IMC conduits, three EMTs, or three nonmetallic conduits), not a mixture (e.g., two rigid aluminum conduits and one rigid steel conduit).

The presence of the word *polarity* throughout the section specifically allows the inclusion of dc circuits.

See also

300.3(B)(1) for more information on paralleled installations

(3) Separate Cables or Raceways. Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor.

All parallel raceways or cables for a circuit are required to be of the same size, material, and length. “Cables,” in this case, means wiring method-type cables such as Type MC. The impedance of a circuit in an aluminum raceway or aluminum-sheathed cable differs from the impedance of the same circuit in a steel raceway or steel-sheathed cable; therefore, separate raceways and cables must have the same physical characteristics. Also, the same number of conductors must be used in each raceway or cable.

See also

300.20 regarding induced currents in metal enclosures or raceways

(4) Ampacity Adjustment. Conductors installed in parallel shall comply with the provisions of **310.15(B)(3)(a)**.

(5) Equipment Grounding Conductors. Where parallel equipment grounding conductors are used, they shall be sized in accordance with **250.122**. Sectioned equipment grounding conductors smaller than 1/0 AWG shall be permitted in multiconductor cables, if the combined circular mil area of the sectioned equipment grounding conductors in each cable complies with **250.122**.

(6) Bonding Jumpers. Where parallel equipment bonding jumpers or supply-side bonding jumpers are installed in raceways, they shall be sized and installed in accordance with **250.102**.

The equipment bonding jumper size requirements may be different from the requirements for equipment grounding conductors. On the supply side of the service, the size of the bonding jumper is based on **250.102(C)(1)**, which is the same as the requirement in **250.66** for grounding electrode conductors. On the load side of the service, the size is based on **250.122**, which is also the size requirement for equipment grounding conductors. The 1/0 AWG minimum size limitation on paralleled conductors does not apply to the equipment bonding jumper.

310.15 Ampacities for Conductors Rated 0–2000 Volts.

(A) General.

(1) Tables or Engineering Supervision. Ampacities for conductors shall be permitted to be determined by tables as provided in **310.15(B)** or under engineering supervision, as provided in **310.15(C)**.

Informational Note No. 1: Ampacities provided by this section do not take voltage drop into consideration. See **210.19(A)**, Informational Note No. 4, for branch circuits and **215.2(A)**, Informational Note No. 2, for feeders.

Two methods are permitted for determining conductor ampacity for conductors rated 0 through 2000 volts: selecting the ampacity from a table, using correction factors in the table or notes where necessary, or calculating the ampacity. The latter method can be complex and time consuming and requires engineering supervision. It can, however, result in lower installation costs.

See also

310.15(C), its commentary, and **Informative Annex B** for further explanation

Informational Note No. 2: For the allowable ampacities of Type MTW wire, see Table 13.5.1 in NFPA 79-2015, *Electrical Standard for Industrial Machinery*.

(2) Selection of Ampacity. Where more than one ampacity applies for a given circuit length, the lowest value shall be used.

Exception: Where different ampacities apply to portions of a circuit, the higher ampacity shall be permitted to be used if the total portion(s) of the circuit with lower ampacity does not exceed the lesser of 3.0 m (10 ft) or 10 percent of the total circuit.

Informational Note: See **110.14(C)** for conductor temperature limitations due to termination provisions.

Calculation Example

Three 500-kcmil THW conductors in a RMC are run from a motor control center for 12 ft past a heat-treating furnace to a pump motor located 150 ft from the motor control center. Where run in a 78°F to 86°F ambient temperature, the conductors have an ampacity of 380 A, per **Table 310.15(B)(16)**. The ambient temperature near the furnace, where the conduit is run, is found to be 113°F, and the length of this particular part of the run is greater than 10 ft and more than 10 percent of the total length of the run at the 78°F to 86°F ambient temperature. Determine the ampacity of the total run in accordance with **310.15(A)(2)**.

Solution

Using the ambient temperature correction factors in **Table 310.15(B)(2)(a)** for 113°F, the ampacity is calculated:

$$0.82 \times 380 \text{ A} = 311.6 \text{ A}$$

which is the ampacity of the total run, in accordance with **310.15(A)(2)**.

If the run near the furnace at the 113°F ambient temperature was 10 ft or less in length, then the ampacity of the entire run would have been 380 A, according to the exception to 310.15(A)(2). The heat-sinking effect of the run at the lower ambient temperature is sufficient to reduce the conductor temperature near the furnace.

(3) Temperature Limitation of Conductors. No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

Most terminations are designed for 60°C and/or 75°C maximum temperatures. The higher-rated ampacities for conductors of 90°C, 105°C, and so forth cannot be used unless the terminals at which the conductors terminate have comparable ratings.

Ambient temperature must be considered in determining the allowable ampacity of conductors. Conductors should have a rating above the anticipated maximum ambient temperature. The operating temperature of conductors should be controlled at or below the conductor rating by coordinating conductor size, number of associated conductors, and ampacity for the particular conductor rating and ambient temperature. Tables 310.15(B)(16) through 310.15(B)(20) have ampacities based on a 30°C or 40°C ambient temperature, as indicated in the table heading. Where the ambient temperature is different, Table 310.15(B)(2)(a) or Table 310.15(B)(2)(b) is used to correct the ampacity. If more than three conductors are installed without spacing to allow the adequate dissipation of heat, the additional adjustment shown in 310.15(B)(3)(a) must also be applied.

Calculation Example

Determine the ampacity of 2 AWG THHN copper conductors to be installed in a raceway in an ambient temperature of 50°C (122°F).

Solution

Table 310.15(B)(16) shows that the allowable ampacity of the conductor at 30°C is 130 A, which is multiplied by 0.82 [the ambient temperature correction factor in Table 310.15(B)(2)(a)].

$$130 \text{ A} \times 0.82 = 106.6 \text{ A}$$

Thus, the allowable ampacity of the 2 AWG conductor at 50°C is reduced to 106.6 A. For six of these conductors run in the raceway, 310.15(B)(3)(a) requires the allowable ampacity to be further reduced to 80 percent:

$$106.6 \text{ A} \times 0.8 = 85.28 \text{ A}$$

Under these conditions, the 2 AWG conductors would be suitable for an 80-A circuit, based on the standard ampere ratings of circuit breaker and fuses in 240.6(A).

The basis for determining the ampacities of conductors for Tables 310.15(B)(16) and 310.15(B)(17) was the NEMA *Report of Determination of Maximum Permissible Current-Carrying Capacity of Code Insulated*

Wires and Cables for Building Purposes, dated June 27, 1938. The basis for determining the ampacities of conductors for Tables 310.15(B)(18) and 310.15(B)(19) and the ampacity tables in Informative Annex B was the Neher–McGrath Method.

See also

310.15(C) and its commentary regarding the Neher–McGrath Method

Informational Note No. 1: The temperature rating of a conductor [see Table 310.104(A) and Table 310.104(C)] is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Informative Annex B, the ambient temperature correction factors in 310.15(B)(2), and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors. The principal determinants of operating temperature are as follows:

- (1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.
- (2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.
- (3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.
- (4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

Informational Note No. 1 focuses attention on the necessity for derating conductors where high ambient temperatures are encountered. It also provides helpful information in coordinating ampacities, ambient temperatures, conductor size and number, and so forth to ensure operation at or below the temperature rating.

Item (2) of the informational note explains that heating due to harmonic current should also be considered in determinations of operating temperature. In certain cases, larger-sized conductors may be required.

See also

310.10(H)(1), Exception No. 2 (and the informational note and associated commentary) for existing installations

Informational Note No. 2: Refer to 110.14(C) for the temperature limitation of terminations.

(B) Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity Table 310.15(B)(16) through Table 310.15(B)(19), and Ampacity Table 310.15(B)(20) and Table 310.15(B)(21) as modified by 310.15(B)(1) through (B)(7).

The temperature correction and adjustment factors shall be permitted to be applied to the ampacity for the temperature rating of the conductor, if the corrected and adjusted ampacity does not exceed the ampacity for the temperature rating of the termination in accordance with the provisions of 110.14(C).

Table 310.15(B)(2)(b) is employed for ambient temperature correction based on 40°C for use with Tables 310.15(B)(18) and 310.15(B)(20).

Informational Note: **Table 310.15(B)(16)** through **Table 310.15(B)(19)** are application tables for use in determining conductor sizes on loads calculated in accordance with **Article 220**. Allowable ampacities result from consideration of one or more of the following:

- (1) Temperature compatibility with connected equipment, especially the connection points.
- (2) Coordination with circuit and system overcurrent protection.
- (3) Compliance with the requirements of product listings or certifications. See **110.3(B)**.
- (4) Preservation of the safety benefits of established industry practices and standardized procedures.

Ampacity tables, particularly **Table 310.15(B)(16)**, do not take into account all factors affecting ampacity. However, experience has proven the table values to be adequate for loads calculated in accordance with **Article 220**, because not all of the load diversity occurring in most installations is specifically provided for in **Article 220**. If loads are not calculated in accordance with the requirements of **Article 220**, the table ampacities, even when corrected in accordance with ambient correction factors and the notes to the tables, might be higher than needed for the actual load.

See also

310.15(C), its commentary, and **Informative Annex B** for more information

(1) General. For explanation of type letters used in tables and for recognized sizes of conductors for the various conductor insulations, see **Table 310.104(A)** and **Table 310.104(B)**. For installation requirements, see **310.1** through **310.15(A)(3)** and the various articles of this *Code*. For flexible cords, see **Table 400.4**, **Table 400.5(A)(1)**, and **Table 400.5(A)(2)**.

(2) Ambient Temperature Correction Factors. Ampacities for ambient temperatures other than those shown in the ampacity tables shall be corrected in accordance with **Table 310.15(B)(2)(a)** or **Table 310.15(B)(2)(b)**, or shall be permitted to be calculated using the following equation:

$$I' = I \sqrt{\frac{T_c - T'_a}{T_c - T_a}} \quad [310.15(B)(2)]$$

where:

I' = ampacity corrected for ambient temperature

I = ampacity shown in the tables

T_c = temperature rating of conductor (°C)

T'_a = new ambient temperature (°C)

T_a = ambient temperature used in the table (°C)

(3) Adjustment Factors.

(a) More than Three Current-Carrying Conductors. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in **Table 310.15(B)(3)(a)**. Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

Where conductors of different systems, as provided in **300.3**, are installed in a common raceway or cable, the adjustment factors shown in **Table 310.15(B)(3)(a)** shall apply only to the number of power and lighting conductors (**Articles 210, 215, 220, and 230**).

TABLE 310.15(B)(2)(a) Ambient Temperature Correction Factors Based on 30°C (86°F)

For ambient temperatures other than 30°C (86°F), multiply the allowable ampacities specified in the ampacity tables by the appropriate correction factor shown below.				
Ambient Temperature (°C)	Temperature Rating of Conductor			Ambient Temperature (°F)
	60°C	75°C	90°C	
10 or less	1.29	1.20	1.15	50 or less
11–15	1.22	1.15	1.12	51–59
16–20	1.15	1.11	1.08	60–68

TABLE 310.15(B)(3)(a) Adjustment Factors for More Than Three Current-Carrying Conductors

Number of Conductors ¹	Percent of Values in Table 310.15(B)(16) Through Table 310.15(B)(19) as Adjusted for Ambient Temperature if Necessary
4–6	80
7–9	70
10–20	50
21–30	45
31–40	40
41 and above	35

¹Number of conductors is the total number of conductors in the raceway or cable, including spare conductors. The count shall be adjusted in accordance with 310.15(B)(5) and (6). The count shall not include conductors that are connected to electrical components that cannot be simultaneously energized.

The factors in Table 310.15(B)(3)(a) are based on no diversity, meaning that all conductors in the raceway or cable are loaded to their maximum

rated load. The table values can be used even if there is diversity, because the table values would represent a worst-case scenario. If there is diversity and a more favorable adjustment factor is desired, a calculation can be performed in accordance with Informative Annex B.

The basis for the last paragraph of 310.15(B)(3)(a) is the assumption that the watt loss (heating) from any control and signal conductors in the same raceway or cable will not be enough to significantly increase the temperature of the power and lighting conductors.

760.51 and 760.130 for fire alarm systems

770.110 for optical fiber cables and raceways

800.110 for communications wires and cables within buildings

Informational Note No. 1: See Annex B for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

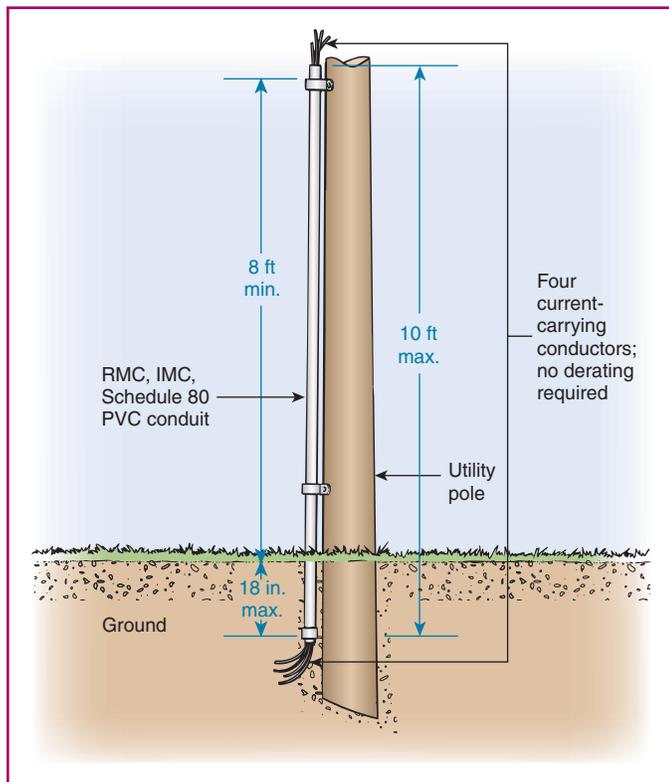

EXHIBIT 310.3 Conditions under which derating factors do not apply.

Informational Note No. 2: See [366.23](#) for adjustment factors for conductors and ampacity for bare copper and aluminum bars in auxiliary gutters and [376.22\(B\)](#) for adjustment factors for conductors in metal wireways.

The conditions under which derating factors do not apply are specified in [310.15\(B\)\(3\)\(a\)\(2\)](#) through (4). [Exhibit 310.3](#) illustrates the conditions specified in [310.15\(B\)\(3\)\(a\)\(3\)](#).

- (1) Where conductors are installed in cable trays, the provisions of [392.80](#) shall apply.
- (2) Adjustment factors shall not apply to conductors in raceways having a length not exceeding 600 mm (24 in.).
- (3) Adjustment factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit (PVC), or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05 m (10 ft), and if the number of conductors does not exceed four.
- (4) Adjustment factors shall not apply to Type AC cable or to Type MC cable under the following conditions:
 - a. The cables do not have an overall outer jacket.
 - b. Each cable has not more than three current-carrying conductors.
 - c. The conductors are 12 AWG copper.

- d. Not more than 20 current-carrying conductors are installed without maintaining spacing, are stacked, or are supported on “bridle rings.”

Exception to (4): If cables meeting the requirements in [310.15\(B\)\(3\)\(4\)a](#) through [c](#) with more than 20 current-carrying conductors are installed longer than 600 mm (24 in.) without maintaining spacing, are stacked, or are supported on bridle rings, a 60 percent adjustment factor shall be applied.

Calculation Example

A commercial office space requires fourteen 277-V fluorescent lighting circuits to serve the office area. The office area lighting is assumed to be a continuous load, and the office ambient temperature does not exceed 30°C (86°F). Each circuit is arranged so that it has a calculated load not exceeding 16 A. The wiring method is Type MC cable, 3-conductor (with an additional equipment grounding conductor), 12 AWG THHN copper. Each individual MC cable contains a 3-wire multiwire branch circuit. To serve the entire area, this arrangement requires a total of seven cables bundled for a distance of 25 ft, without maintaining spacing between them where they leave the electrical room and enter the office area.

Determine the ampacity of each circuit conductor in accordance with [310.15](#), applying [310.15\(B\)\(3\)\(a\)\(4\)](#) to account for the bundled cables. Then determine the maximum permitted branch-circuit overcurrent protection

Solution

Step 1. Determine the quantity of current-carrying conductors. According to [310.15\(B\)\(6\)](#), equipment grounding conductors are not counted as current-carrying conductors. Fluorescent lighting is considered a nonlinear load, and, according to [310.15\(B\)\(5\)\(c\)](#), the grounded conductor of each Type MC cable must be counted as a current-carrying conductor:

$$7 \text{ cables} \times 3 \text{ conductors each} = 21 \text{ current-carrying conductors}$$

Step 2. Determine the ampacity of each current-carrying conductor. Because the quantity of current-carrying conductors being bundled exceeds 20, a 60-percent adjustment factor is required by [310.15\(B\)\(3\)\(a\)\(4\)](#), Exception. From [Table 310.15\(B\)\(16\)](#):

$$\begin{aligned} 12 \text{ AWG THHN} &= 30 \text{ A} \\ 30 \text{ A} \times 0.60 &= 18 \text{ A} \end{aligned}$$

Because the actual calculated load is 16 A of continuous load, [210.19\(A\)\(1\)](#) is applicable. The conductors must have an ampacity equal to or greater than the load before the adjustment factor is applied. Because the ampacity of the conductors after the adjustment factor is applied is 18 A, the conductors are suitable for this installation.

Step 3. Finally, determine the maximum size of the OCPD permitted for these bundled cables. Section 240.4(B) permits the use of the next higher standard rating of OCPD. Therefore, although the conductors have a calculated ampacity of 18 A, a 20-A OCPD is permitted. In addition, and of significance, the 20-A OCPD is in compliance with 210.20(A), given that the actual 16-A continuous load would require a 20-A OCPD.

(b) *Raceway Spacing.* Spacing between raceways shall be maintained.

(c) *Raceways and Cables Exposed to Sunlight on Rooftops.* Where raceways or cables are exposed to direct sunlight on or above rooftops, raceways or cables shall be installed a minimum distance above the roof to the bottom of the raceway or cable of 23 mm (¾ in.). Where the distance above the roof to the bottom of the raceway is less than 23 mm (¾ in.), a temperature adder of 33°C (60°F) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.15(B)(2)(a) or Table 310.15(B)(2)(b).

Exception: Type XHHW-2 insulated conductors shall not be subject to this ampacity adjustment.

Informational Note: One source for the ambient temperatures in various locations is the ASHRAE Handbook — Fundamentals.

Conductors in outdoor conduits or cables installed less than ¾ in. above the surface of the roof are subject to a significant increase in temperature when the roof is exposed to direct sunlight.

Calculation Example

A feeder installed in IMC runs across the top of a commercial building in St. Louis, MO. The calculated load on the feeder is 175 A. The lateral portion of the raceway is exposed to sunlight and secured to supports elevated less than ¾ inches above the finished rooftop surface. Determine the minimum size circuit conductor using aluminum 90°C THWN-2 insulation, taking into consideration only the exposure to sunlight. None of the loads are continuous, and the neutral is not considered a current-carrying conductor. The design temperature is based on the averaged June, July, and August 2-percent design temperature from the 2009 ASHRAE Handbook — Fundamentals.

Solution

Step 1. Determine the ambient temperature (compensated for proximity of conduit to the rooftop exposure to sunlight):

- Compensated ambient temperature = design temperature + 60°F as required by 310.15(B)(3)(c)
- Design temperature for St. Louis area = 95°F
- Temperature adjustment for a raceway elevated less than ¾ in. above rooftop = 60°F
- Compensated ambient temperature: 95°F + 60°F = 155°F

Step 2. Determine the temperature correction factor for this application from Table 310.15(B)(2)(a). Using the 90°C column and the temperature correction factor row for 155°F, the temperature correction factor is 0.58.

Step 3. Determine the proper conductor size to supply the 175-A load.

- Because the load is calculated at 175 A noncontinuous, and the neutral conductor is not considered to be a current-carrying conductor, the conductor ampacity is calculated as follows:

$$175 \text{ A} \div 0.58 = 302 \text{ A}$$

- Select a conductor not less than 302 A from the aluminum 90°C column of Table 310.15(B)(16):

400 kcmil aluminum THWN-2

- Verify that the conductor ampacity at 75°C is sufficient for the calculated load to comply with terminal temperature requirements of 110.14(C): The 75°C aluminum column of Table 310.15(B)(16) ampacity equals 270 A, which is greater than the 175-A calculated load.

Using a very specific set of circumstances, this example demonstrates that roughly a 42-percent loss of usable conductor ampacity occurred. This loss was due solely to high ambient heat present where the raceway was subjected to sunlight and installed within ¾ in. to the rooftop.

(4) **Bare or Covered Conductors.** Where bare or covered conductors are installed with insulated conductors, the temperature rating of the bare or covered conductor shall be equal to the lowest temperature rating of the insulated conductors for the purpose of determining ampacity.

(5) Neutral Conductor.

(a) A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to be counted when applying the provisions of 310.15(B)(3)(a).

(b) In a 3-wire circuit consisting of two phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of 310.15(B)(3)(a).

(c) On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral conductor shall therefore be considered a current-carrying conductor.

Nonlinear loads on 3-phase circuits can cause an increase in neutral conductor current. Exhibit 310.4 shows an example of a portable diagnostic analyzer used for more sophisticated power measurements, including measuring harmonic distortion.

(6) **Grounding or Bonding Conductor.** A grounding or bonding conductor shall not be counted when applying the provisions of 310.15(B)(3)(a).

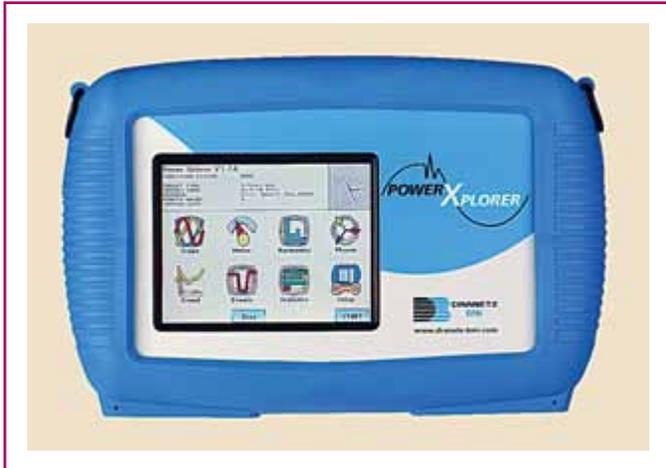

EXHIBIT 310.4 A portable tool for tasks such as diagnostic power analysis, including harmonic distortion, where accurate measurement and thorough circuit analysis is desirable. (Courtesy of Dranetz-BMI)

(7) Single-Phase Dwelling Services and Feeders. For one-family dwellings and the individual dwelling units of two-family and multifamily dwellings, service and feeder conductors supplied by a single-phase, 120/240-volt system shall be permitted to be sized in accordance with 310.15(B)(7)(1) through (4).

For one-family dwellings and the individual dwelling units of two-family and multifamily dwellings, single-phase feeder conductors consisting of 2 ungrounded conductors and the neutral conductor from a 208Y/120 volt system shall be permitted to be sized in accordance with 310.15(B)(7)(1) through (3).

- (1) For a service rated 100 through 400 amperes, the service conductors supplying the entire load associated with a one-family dwelling, or the service conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling, shall be permitted to have an ampacity not less than 83 percent of the service rating.
- (2) For a feeder rated 100 through 400 amperes, the feeder conductors supplying the entire load associated with a one-family dwelling, or the feeder conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling, shall be permitted to have an ampacity not less than 83 percent of the feeder rating.
- (3) In no case shall a feeder for an individual dwelling unit be required to have an ampacity greater than that specified in 310.15(B)(7)(1) or (2).
- (4) Grounded conductors shall be permitted to be sized smaller than the ungrounded conductors, if the requirements of 220.61 and 230.42 for service conductors or the requirements of 215.2 and 220.61 for feeder conductors are met.

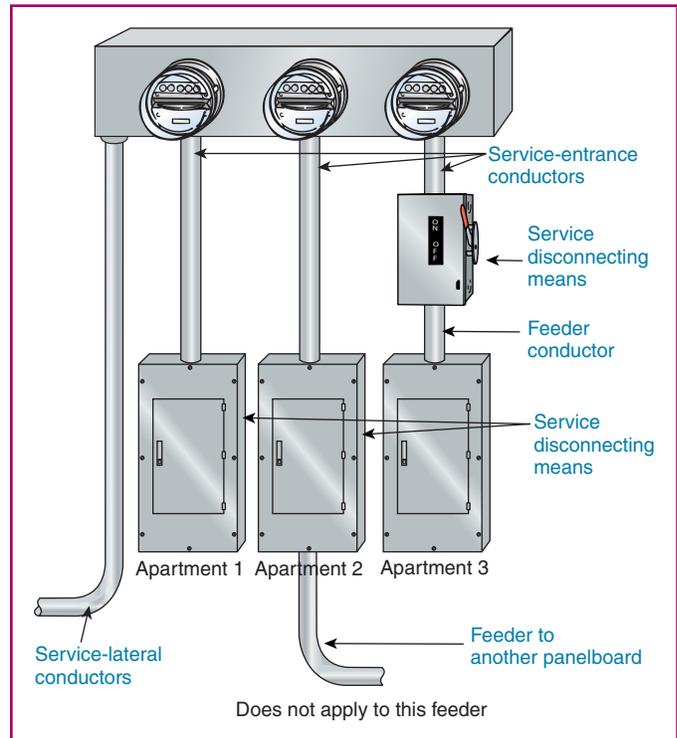

EXHIBIT 310.5 One application where the reduced conductor size is applicable to the service-entrance conductors.

Where correction or adjustment factors are required by 310.15(B)(2) or (3), they shall be permitted to be applied to the ampacity associated with the temperature rating of the conductor.

Informational Note No. 1: The service or feeder ratings addressed by this section are based on the standard ampacity ratings from 240.6(A).

Informational Note No. 2: See Example D7 in Annex D.

The main service or feeder to a dwelling unit is permitted to be sized at 83 percent of the disconnect rating. The calculation is not based on the rating of the overcurrent device protecting the main feeder. The minimum disconnect rating for a dwelling unit is 100 amperes according to 225.39 and 230.79. This calculation applies only to conductors carrying 100 percent of the dwelling unit's diversified load.

If a 120/240-volt single-phase service supplies a one-family dwelling, or an individual unit of two-family or multifamily dwelling, then the reduced conductor size is applicable to the service-entrance conductors or feeder conductors that supply a dwelling unit. The feeder conductors to a dwelling unit are not required to be larger than its service-entrance conductors.

Exhibit 310.5 illustrates where 310.15(B)(7) could be applied. The reduced conductor size permitted is applicable only to the service-entrance conductors run to each apartment from the meters. The reduced conductor size permitted is also applicable to the feeder conductors run to Apartment 3 from the service disconnecting means, because this feeder carries the entire load.

(C) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general equation:

$$I = \sqrt{\frac{T_c - T_a}{R_{dc}(1 + Y_c)R_{ca}}} \times 10^3 \text{ amperes [310.15(C)]}$$

where:

- T_c = conductor temperature in degrees Celsius (°C)
- T_a = ambient temperature in degrees Celsius (°C)
- R_{dc} = dc resistance of 305 mm (1 ft) of conductor in microohms at temperature, T_c
- Y_c = component ac resistance resulting from skin effect and proximity effect
- R_{ca} = effective thermal resistance between conductor and surrounding ambient

The formula is an engineered approach to conductor ampacity developed by J. H. Neher and M. H. McGrath and is commonly referred to as the Neher–McGrath Method.

310.60 Conductors Rated 2001 to 35,000 Volts.

(A) Ampacities of Conductors Rated 2001 to 35,000 Volts. Ampacities for solid dielectric-insulated conductors shall be permitted to be determined by tables or under engineering supervision, as provided in 310.60(B) and (C).

(1) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted

TABLE 310.15(B)(21) (formerly Table 310.21) Ampacities of Bare or Covered Conductors in Free Air, Based on 40°C (104°F) Ambient, 80°C (176°F) Total Conductor Temperature, 610 mm/sec (2 ft/sec) Wind Velocity

—	—	—	—	2000	1454	2000	1527

to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length calculated at the higher ampacity, whichever is less.

Informational Note: See 110.40 for conductor temperature limitations due to termination provisions.

(B) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by using the following general equation:

$$I = \sqrt{\frac{T_c - (T_a + \Delta T_d)}{R_{dc} (1 + Y_c) R_{ca}}} \times 10^3 \text{ amperes [310.60(B)]}$$

where:

- T_c = conductor temperature (°C)
- T_a = ambient temperature (°C)
- ΔT_d = dielectric loss temperature rise
- R_{dc} = dc resistance of conductor at temperature T_c
- Y_c = component ac resistance resulting from skin effect and proximity effect
- R_{ca} = effective thermal resistance between conductor and surrounding ambient

Informational Note: The dielectric loss temperature rise (ΔT_d) is negligible for single circuit extruded dielectric cables rated below 46 kV.

(C) Tables. Ampacities for conductors rated 2001 to 35,000 volts shall be as specified in Table 310.60(C)(67) through Table 310.60(C)(86). Ampacities for ambient temperatures other than those specified in the ampacity tables shall be corrected in accordance with 310.60(C)(4).

Informational Note No. 1: For ampacities calculated in accordance with 310.60(A), reference IEEE 835-1994, *Standard Power Cable Ampacity Tables*, and the references therein for availability of all factors and constants.

Informational Note No. 2: Ampacities provided by this section do not take voltage drop into consideration. See 210.19(A), Informational Note No. 4, for branch circuits and 215.2(A), Informational Note No. 2, for feeders.

(1) Grounded Shields. Ampacities shown in Table 310.60(C)(69), Table 310.60(C)(70), Table 310.60(C)(81), and Table 310.60(C)(82) shall apply for cables with shields grounded at one point only. Where shields for these cables are grounded at more than one point, ampacities shall be adjusted to take into consideration the heating due to shield currents.

Informational Note: Tables other than those listed contain the ampacity of cables with shields grounded at multiple points.

(2) Burial Depth of Underground Circuits. Where the burial depth of direct burial or electrical duct bank circuits is modified from the values shown in a figure or table, ampacities shall be permitted to be modified as indicated in (B)(2)(a) and (B)(2)(b).

(a) Where burial depths are increased in part(s) of an electrical duct run, a decrease in ampacity of the conductors shall not be required, provided the total length of parts of the duct run increased in depth is less than 25 percent of the total run length.

(b) Where burial depths are deeper than shown in a specific underground ampacity table or figure, an ampacity derating factor

of 6 percent per 300 mm (1 ft) increase in depth for all values of rho shall be permitted.

No ampacity adjustments shall be required where the burial depth is decreased.

(3) Electrical Ducts in Figure 310.60. At locations where electrical ducts enter equipment enclosures from underground, spacing between such ducts, as shown in Figure 310.60(C)(3), shall be permitted to be reduced without requiring the ampacity of conductors therein to be reduced.

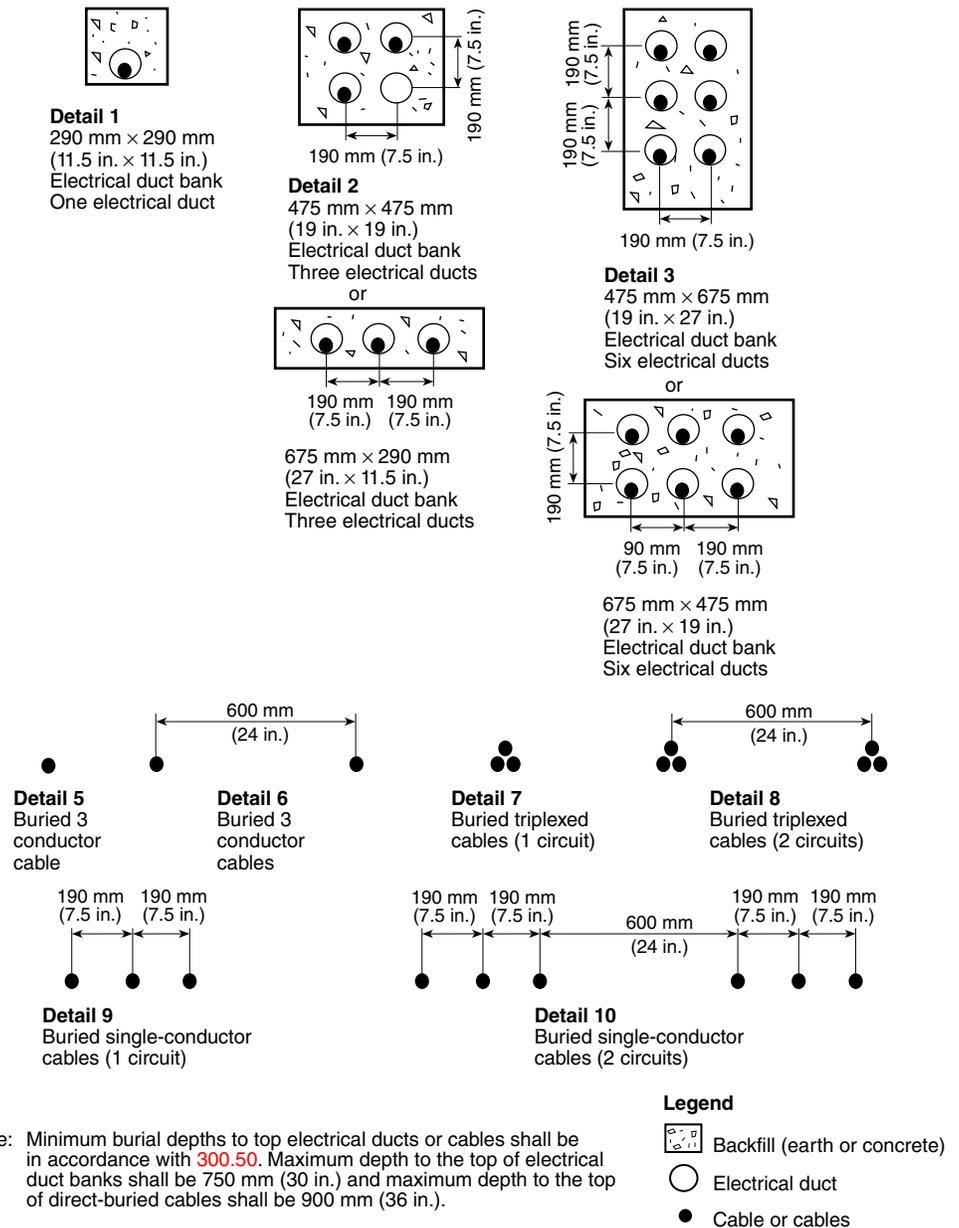

FIGURE 310.60(C)(3) Cable Installation Dimensions for Use with Table 310.60(C)(77) Through Table 310.60(C)(86).

The term *electrical ducts*, as defined in 310.2, is used to differentiate these from other ducts, such as those used for air handling. The term is intended to include nonmetallic electrical ducts commonly used for underground wiring, as well as other raceways (such as RMC, IMC, PVC conduit, and HDPE conduit) listed for use underground in earth or concrete.

(4) Ambient Temperature Correction. Ampacities for ambient temperatures other than those specified in the ampacity tables shall be corrected in accordance with Table 310.60(C)(4) or shall be permitted to be calculated using the following equation:

$$I' = I \sqrt{\frac{T_c - T'_a}{T_c - T_a}} \quad [310.60(C)(4)]$$

where:

- I' = ampacity corrected for ambient temperature
- I = ampacity shown in the table for T_c and T_a
- T_c = temperature rating of conductor (°C)
- T'_a = new ambient temperature (°C)
- T_a = ambient temperature used in the table (°C)

TABLE 310.60(C)(4) Ambient Temperature Correction Factors

For ambient temperatures other than 40°C (104°F), multiply the allowable ampacities specified in the ampacity tables by the appropriate factor shown below.			
Ambient Temperature (°C)	Temperature Rating of Conductor		Ambient Temperature (°F)
	90°C	105°C	
10 or less	1.26	1.21	50 or less
11–15	1.22	1.18	51–59
16–20	1.18	1.14	60–68
21–25	1.14	1.11	69–77
26–30	1.10	1.07	78–86
31–35	1.05	1.04	87–95
36–40	1.00	1.00	96–104
41–45	0.95	0.96	105–113
46–50	0.89	0.92	114–122
51–55	0.84	0.88	123–131
56–60	0.77	0.83	132–140
61–65	0.71	0.78	141–149
66–70	0.63	0.73	150–158
71–75	0.55	0.68	159–167
76–80	0.45	0.62	168–176
81–85	0.32	0.55	177–185
86–90	—	0.48	186–194
91–95	—	0.39	195–203
96–100	—	0.28	204–212

TABLE 310.60(C)(67) Ampacities of Insulated Single Copper Conductor Cables Triplexed in Air Based on Conductor Temperatures of 90°C (194°F) and 105°C (221°F) and Ambient Air Temperature of 40°C (104°F)*

Conductor Size (AWG or kcmil)	Temperature Rating of Conductor [See Table 310.104(C).]			
	2001–5000 Volts Ampacity		5001–35,000 Volts Ampacity	
	90°C (194°F) Type MV-90	105°C (221°F) Type MV-105	90°C (194°F) Type MV-90	105°C (221°F) Type MV-105

Part III. Construction Specifications

310.104 Conductor Constructions and Applications. Insulated conductors shall comply with the applicable provisions of Table 310.104(A) through Table 310.104(E).

Informational Note: Thermoplastic insulation may stiffen at temperatures lower than –10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support.

Table 310.104(A) includes conductor applications and maximum operating temperatures. Some conductors with dual ratings are listed for dry, damp, and wet locations. Type XHHW is rated 90°C for dry and damp locations and 75°C for wet locations, and Type THW is rated 75°C for dry and wet locations and 90°C for special applications within electric-discharge lighting equipment. Types RHW-2, XHHW-2, and other types identified by the suffix “2” are rated 90°C for dry and wet locations.

Additional detailed wire classification information for sizes 14 AWG through 2000 kcmil is available in standards and directories such as those published by Underwriters Laboratories Inc.

310.106 Conductors.

Wires and cables that meet the minimum fire, electrical, and physical properties required by the applicable standards are permitted to be marked with the letter designations found in Tables 310.104(A) and (C).

See also

310.104 for the requirements of insulated conductor construction and applications

(A) Minimum Size of Conductors. The minimum size of conductors shall be as shown in Table 310.106(A), except as permitted elsewhere in this Code.

Section 310.106 requires the minimum conductor sizes listed in Table 310.106(A), except as permitted in the sections that follow:

¹Conductors can be rated up to 1000 V if listed and marked.

²Some insulations do not require an outer covering.

³Where design conditions require maximum conductor operating temperatures above 90°C (194°F).

⁴For signaling circuits permitting 300-volt insulation.

⁵For ampacity limitation, see 340.80.

⁶Includes integral jacket.

⁷Insulation thickness shall be permitted to be 2.03 mm (80 mils) for listed Type USE conductors that have been subjected to special investigations. The nonmetallic covering over individual rubber-covered conductors of aluminum-sheathed cable and of lead-sheathed or multiconductor cable shall not be required to be flame retardant. For Type MC cable, see 330.104. For nonmetallic-sheathed cable, see Article 334, Part III. For Type UF cable, see Article 340, Part III.

TABLE 310.104(B) Thickness of Insulation for Nonshielded Types RHH and RHW Solid Dielectric Insulated Conductors Rated 2000 Volts

¹**100 Percent Insulation Level.** Cables in this category shall be permitted to be applied where the system is provided with relay protection such that ground faults will be cleared as rapidly as possible but, in any case, within 1 minute. While these cables are applicable to the great majority of cable installations that are on grounded systems, they shall be permitted to be used also on other systems for which the application of cables is acceptable, provided the above clearing requirements are met in completely de-energizing the faulted section.

²**133 Percent Insulation Level.** This insulation level corresponds to that formerly designated for ungrounded systems. Cables in this category shall be permitted to be applied in situations where the clearing time requirements of the 100 percent level category cannot be met and yet there is adequate assurance that the faulted section will be de-energized in a time not exceeding 1 hour. Also, they shall be permitted to be used in 100 percent insulation level applications where additional insulation is desirable.

³**173 Percent Insulation Level.** Cables in this category shall be permitted to be applied under all of the following conditions:

- (1) In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation
- (2) Where the fault clearing time requirements of the 133 percent level category cannot be met
- (3) Where an orderly shutdown is essential to protect equipment and personnel
- (4) There is adequate assurance that the faulted section will be de-energized in an orderly shutdown

Also, cables with this insulation thickness shall be permitted to be used in 100 or 133 percent insulation level applications where additional insulation strength is desirable.

TABLE 310.106(A) Minimum Size of Conductors

Conductor Voltage Rating (Volts)	Minimum Conductor Size (AWG)	
	Copper	Aluminum or Copper-Clad Aluminum
0–2000	14	12
2001–5000	8	8
5001–8000	6	6
8001–15,000	2	2
15,001–28,000	1	1
28,001–35,000	1/0	1/0

(B) Conductor Material. Conductors in this article shall be of aluminum, copper-clad aluminum, or copper unless otherwise specified.

Solid aluminum conductors 8, 10, and 12 AWG shall be made of an AA-8000 series electrical grade aluminum alloy conductor material. Stranded aluminum conductors 8 AWG through 1000 kcmil marked as Type RHH, RHW, XHHW, THW, THHW, THWN, THHN, service-entrance Type SE Style U, and SE Style R shall be made of an AA-8000 series electrical grade aluminum alloy conductor material.

This coordinates with the UL listing requirements for testing terminations — such as CO/ALR devices and other connectors — suitable for

use with aluminum conductors. The electrical industry has developed AA-8000 series aluminum alloy materials and the connectors suitable for use with aluminum conductors to provide for safe and stable connections. Connections suitable for use with aluminum conductors are also generally listed as suitable for use with copper conductors and are marked accordingly, such as AL7CU or AL9CU. Numbers 7 and 9 identify the temperature ratings of 75°C and 90°C, respectively, for these terminations.

Copper-clad aluminum conductors are drawn from a copper-clad aluminum rod with the copper metallurgically bonded to an aluminum core. The copper forms a minimum of 10 percent of the cross-sectional area of a solid conductor or of each strand of a stranded conductor.

(C) Stranded Conductors. Where installed in raceways, conductors 8 AWG and larger, not specifically permitted or required elsewhere in this *Code* to be solid, shall be stranded.

Large-size conductors are required to be stranded for greater flexibility. This requirement does not apply to conductors outside of raceways, such as busbars and the conductors of Type MI metal-sheathed cable. Special applications elsewhere in the *NEC* may require or permit different requirements for stranded conductors. For example, the bonding conductors of a permanently installed swimming pool are required to be solid copper conductors of 8 AWG or larger, according to 680.26(B).

(D) Insulated. Conductors, not specifically permitted elsewhere in this *Code* to be covered or bare, shall be insulated.

Informational Note: See 250.184 for insulation of neutral conductors of a solidly grounded high-voltage system.

310.110 Conductor Identification.

(A) Grounded Conductors. Insulated or covered grounded conductors shall be identified in accordance with 200.6.

(B) Equipment Grounding Conductors. Equipment grounding conductors shall be in accordance with 250.119.

(C) Ungrounded Conductors. Conductors that are intended for use as ungrounded conductors, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Distinguishing markings shall not conflict in any manner with the surface markings required by 310.120(B)(1). Branch-circuit ungrounded conductors shall be identified in accordance with 210.5(C). Feeders shall be identified in accordance with 215.12.

The identification requirements apply only where a premises wiring system has circuits from more than one nominal voltage system.

See also

210.5(C) and 215.12 and associated commentary for more information on identification

Exception: Conductor identification shall be permitted in accordance with 200.7.

Ungrounded conductors with white or gray insulation are permitted if the conductors are permanently re-identified at termination points and are visible and accessible. Common methods of re-identification include colored tape, tagging, or paint. Other applications where white conductors are permitted include flexible cords and circuits less than 50 volts. A white conductor used in single-pole, 3-way and 4-way switch loops also requires re-identification (a color other than white, gray, or green) if it is used as an ungrounded conductor.

See also

200.7(C)(2) for further information about re-identification of grounded conductors

310.120 Marking.

(A) Required Information. All conductors and cables shall be marked to indicate the following information, using the applicable method described in 310.120(B):

- (1) The maximum rated voltage.
- (2) The proper type letter or letters for the type of wire or cable as specified elsewhere in this *Code*.
- (3) The manufacturer's name, trademark, or other distinctive marking by which the organization responsible for the product can be readily identified.
- (4) The AWG size or circular mil area.

Informational Note: See Conductor Properties, Table 8 of Chapter 9, for conductor area expressed in SI units for conductor sizes specified in AWG or circular mil area.

- (5) Cable assemblies where the neutral conductor is smaller than the ungrounded conductors shall be so marked.

(B) Method of Marking.

(1) Surface Marking The following conductors and cables shall be durably marked on the surface. The AWG size or circular mil area shall be repeated at intervals not exceeding 610 mm (24 in.). All other markings shall be repeated at intervals not exceeding 1.0 m (40 in.).

- (1) Single-conductor and multiconductor rubber- and thermoplastic-insulated wire and cable
- (2) Nonmetallic-sheathed cable
- (3) Service-entrance cable
- (4) Underground feeder and branch-circuit cable
- (5) Tray cable
- (6) Irrigation cable
- (7) Power-limited tray cable
- (8) Instrumentation tray cable

(2) Marker Tape. Metal-covered multiconductor cables shall employ a marker tape located within the cable and running for its complete length.

Exception No. 1: Type MI cable.

Exception No. 2: Type AC cable.

Exception No. 3: The information required in 310.120(A) shall be permitted to be durably marked on the outer nonmetallic covering of Type MC, Type ITC, or Type PLTC cables at intervals not exceeding 1.0 m (40 in.).

Exception No. 4: The information required in 310.120(A) shall be permitted to be durably marked on a nonmetallic covering under the metallic sheath of Type ITC or Type PLTC cable at intervals not exceeding 1.0 m (40 in.).

Informational Note: Included in the group of metal-covered cables are Type AC cable (Article 320), Type MC cable (Article 330), and lead-sheathed cable.

Type PLTC cable may have a metallic sheath or armor over a nonmetallic jacketed cable. A second nonmetallic jacket covering the metallic sheath is optional. Exceptions No. 3 and No. 4 define the marking requirements for either case.

(3) Tag Marking. The following conductors and cables shall be marked by means of a printed tag attached to the coil, reel, or carton:

- (1) Type MI cable
- (2) Switchboard wires
- (3) Metal-covered, single-conductor cables
- (4) Type AC cable

(4) Optional Marking of Wire Size. The information required in 310.120(A)(4) shall be permitted to be marked on the surface of the individual insulated conductors for the following multi-conductor cables:

- (1) Type MC cable
- (2) Tray cable
- (3) Irrigation cable
- (4) Power-limited tray cable
- (5) Power-limited fire alarm cable
- (6) Instrumentation tray cable

(C) Suffixes to Designate Number of Conductors. A type letter or letters used alone shall indicate a single insulated conductor. The letter suffixes shall be indicated as follows:

- (1) D — For two insulated conductors laid parallel within an outer nonmetallic covering
- (2) M — For an assembly of two or more insulated conductors twisted spirally within an outer nonmetallic covering

(D) Optional Markings. All conductors and cables contained in Chapter 3 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistant, and so forth.

Cable insulations that have special characteristics are permitted to carry surface markings that indicate their characteristics. For example, the limited-smoke cables are permitted to be marked “LS” or “ST1.” Other characteristics permitted to be marked include sunlight resistance and low corrosiveness. For a detailed list of optional wire and cable marking, see the UL *Wire Marking Guide*, available from Underwriters Laboratories Inc.

Part I. Scope and Installation

312.1 Scope. This article covers the installation and construction specifications of cabinets, cutout boxes, and meter socket enclosures. It does not apply to equipment operating at over 1000 volts, except as specifically referenced elsewhere in the *Code*.

Cabinets and cutout boxes are designed with a swinging door(s) to enclose potential transformers, current transformers, switches, overcurrent devices, meters, or control equipment. (See the definitions of the terms *cabinet* and *cutout box* in Article 100.) Cabinets and cutout boxes are required to be of sufficient size to accommodate all devices and conductors without overcrowding or jamming. Additional space is often provided through auxiliary gutters (see Article 366).

The serving electric utility often has equipment specifications or service requirements beyond the *NEC*® for meter sockets, metering

cabinets, and metering compartments within switchgear, switchboards, and panelboards. Consulting with the local electric utility on these requirements helps identify suitable equipment for an installation.

312.2 Damp and Wet Locations. In damp or wet locations, surface-type enclosures within the scope of this article shall be placed or equipped so as to prevent moisture or water from entering and accumulating within the cabinet or cutout box, and shall be mounted so there is at least 6-mm (¼-in.) airspace between the enclosure and the wall or other supporting surface. Enclosures installed in wet locations shall be weatherproof. For enclosures in wet locations, raceways or cables entering above the level of uninsulated live parts shall use fittings listed for wet locations.

Exception: Nonmetallic enclosures shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.

Informational Note: For protection against corrosion, see 300.6.

312.3 Position in Wall. In walls of concrete, tile, or other noncombustible material, cabinets shall be installed so that the front edge of the cabinet is not set back of the finished surface more than 6 mm (¼ in.). In walls constructed of wood or other combustible material, cabinets shall be flush with the finished surface or project therefrom.

312.4 Repairing Noncombustible Surfaces. Noncombustible surfaces that are broken or incomplete shall be repaired so there will be no gaps or open spaces greater than 3 mm (⅛ in.) at the edge of the cabinet or cutout box employing a flush-type cover.

The repair of noncombustible surfaces is not limited to plaster or dry-wall types of construction. This requirement for cabinets and cutout boxes is similar to the outlet box requirement found in 314.21.

312.5 Cabinets, Cutout Boxes, and Meter Socket Enclosures. Conductors entering enclosures within the scope of this article shall be protected from abrasion and shall comply with 312.5(A) through (C).

(A) Openings to Be Closed. Openings through which conductors enter shall be closed in an approved manner.

(B) Metal Cabinets, Cutout Boxes, and Meter Socket Enclosures. Where metal enclosures within the scope of this article are installed with messenger-supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, conductors shall enter through insulating bushings or, in dry locations, through flexible tubing extending from the last insulating support and firmly secured to the enclosure.

(C) Cables. Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure.

The installation of several cables bunched together and run through a knockout or chase nipple is prohibited. Individual cable clamps or connectors are required to be used with only one cable per clamp or

connector unless the clamp or connector is identified for more than a single cable.

Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the top of a surface-mounted enclosure through one or more nonflexible raceways not less than 450 mm (18 in.) and not more than 3.0 m (10 ft) in length, provided all of the following conditions are met:

- (1) Each cable is fastened within 300 mm (12 in.), measured along the sheath, of the outer end of the raceway.
- (2) The raceway extends directly above the enclosure and does not penetrate a structural ceiling.
- (3) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion and the fittings remain accessible after installation.
- (4) The raceway is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.
- (5) The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 6 mm (¼ in.).
- (6) The raceway is fastened at its outer end and at other points in accordance with the applicable article.
- (7) Where installed as conduit or tubing, the cable fill does not exceed the amount that would be permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code and all applicable notes thereto. Note 2 to the tables in Chapter 9 does not apply to this condition.

Informational Note: See Table 1 in Chapter 9, including Note 9, for allowable cable fill in circular raceways. See 310.15(B)(3)(a) for required ampacity reductions for multiple cables installed in a common raceway.

312.6 Deflection of Conductors. Conductors at terminals or conductors entering or leaving cabinets or cutout boxes and the like shall comply with 312.6(A) through (C).

Exception: Wire-bending space in enclosures for motor controllers with provisions for one or two wires per terminal shall comply with 430.10(B).

(A) Width of Wiring Gutters. Conductors shall not be deflected within a cabinet or cutout box unless a gutter having a width in accordance with Table 312.6(A) is provided. Conductors in parallel in accordance with 310.10(H) shall be judged on the basis of the number of conductors in parallel.

If Table 312.6(A) is used, bending space is measured in the direction in which the wire leaves the terminal.

Exhibit 312.1 illustrates the requirements of wiring gutter widths as specified in 312.6(A) and Table 312.6(A). The table determines the required gutter width, where *G* stands for the dimension of the gutter, *M* stands for the main conductors, and *BC* stands for the branch circuit conductors.

Gutter width *G*, is required to be 6 inches based on conductors *M*, which are parallel 4/0 conductors.

TABLE 312.6(A) Minimum Wire-Bending Space at Terminals and Minimum Width of Wiring Gutters

Wire Size (AWG or kcmil)		Wires per Terminal

1000–1250	—	254	10	—	—	—	—	—	—	—	—
1500–2000	—	305	12	—	—	—	—	—	—	—	—

Notes:

1. Bending space at terminals shall be measured in a straight line from the end of the lug or wire connector (in the direction that the wire leaves the terminal) to the wall, barrier, or obstruction.
2. This column shall be permitted to be used to determine the minimum wire-bending space for compact stranded aluminum conductors in sizes up to 1000 kcmil and manufactured using AA-8000 series electrical grade aluminum alloy conductor material in accordance with 310.106(B). The minimum width of the wire gutter space shall be determined using the all other conductors value in this table.

Gutter width G_2 is required to be 1½ inches based on conductors BC_2 , which are 6 AWG.

Gutter width G_3 is required to be 3 inches based on conductors BC_3 , which are 1 AWG.

Gutter width G_4 is required to be 4 inches, based on conductor N , which is 4/0 AWG.

As a practical matter, the available gutter space on either side is likely to be equal. Therefore, the allowable space determined for G_3 would typically apply to G_2 as well.

(B) Wire-Bending Space at Terminals. Wire-bending space at each terminal shall be provided in accordance with 312.6(B)(1) or (B)(2).

(1) Conductors Not Entering or Leaving Opposite Wall. Table 312.6(A) shall apply where the conductor does not enter or leave the enclosure through the wall opposite its terminal.

(2) Conductors Entering or Leaving Opposite Wall. Table 312.6(B) shall apply where the conductor does enter or leave the enclosure through the wall opposite its terminal.

Exception No. 1: Where the distance between the wall and its terminal is in accordance with Table 312.6(A), a conductor shall be permitted to enter or leave an enclosure through the wall opposite its terminal, provided the conductor enters or

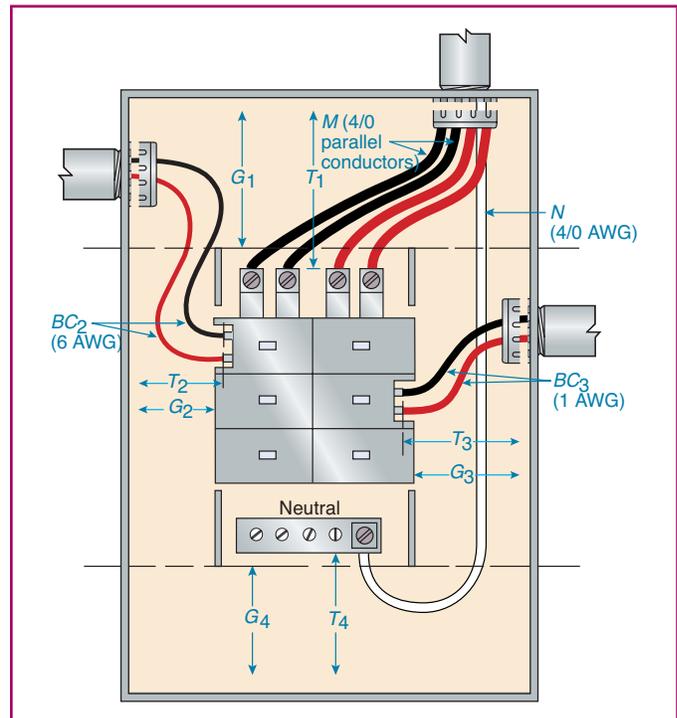

EXHIBIT 312.1 Table 312.6(A) and Table 312.6(B) applied to gutter and wire-bending space within enclosures.

TABLE 312.6(B) Minimum Wire-Bending Space at Terminals

800	—	457	18	508	20	559	22	610	24
900	—	483	19	559	22	610	24	610	24
1000	—	508	20	—	—	—	—	—	—
1250	—	559	22	—	—	—	—	—	—
1500	—	610	24	—	—	—	—	—	—
1750	—	610	24	—	—	—	—	—	—
2000	—	610	24	—	—	—	—	—	—

Notes:

1. Bending space at terminals shall be measured in a straight line from the end of the lug or wire connector in a direction perpendicular to the enclosure wall.

2. For removable and lay-in wire terminals intended for only one wire, bending space shall be permitted to be reduced by the following number of millimeters (inches):

^a12.7 mm (½ in.)

^b25.4 mm (1 in.)

^c38.1 mm (1½ in.)

^d50.8 mm (2 in.)

^e76.2 mm (3 in.)

3. This column shall be permitted to determine the required wire-bending space for compact stranded aluminum conductors in sizes up to 1000 kcmil and manufactured using AA-8000 series electrical grade aluminum alloy conductor material in accordance with 310.106(B).

leaves the enclosure where the gutter joins an adjacent gutter that has a width that conforms to Table 312.6(B) for the conductor.

Exception No. 2: A conductor not larger than 350 kcmil shall be permitted to enter or leave an enclosure containing only a meter socket(s) through the wall opposite its terminal, provided the distance between the terminal and the opposite wall is not

less than that specified in Table 312.6(A) and the terminal is a lay-in type, where the terminal is either of the following:

- (a) Directed toward the opening in the enclosure and within a 45 degree angle of directly facing the enclosure wall
- (b) Directly facing the enclosure wall and offset not greater than 50 percent of the bending space specified in Table 312.6(A)

Informational Note: *Offset* is the distance measured along the enclosure wall from the axis of the centerline of the terminal to a line passing through the center of the opening in the enclosure.

Section 312.6(B)(2) and Table 312.6(B) provide the requirements for wire-bending space where straight-in wiring or offset is employed at terminals. Table 312.6(A) is used when the conductors do not enter or leave the wall opposite its terminal.

If Table 312.6(A) is used, bending space is measured in the direction in which the wire leaves the terminal. If Table 312.6(B) is used, it is measured in a direction perpendicular to the enclosure wall.

Exhibit 312.1 applies the rules of 312.6(B)(1), 312.6(B)(2), and Tables 312.6(A) and 312.6(B). The tables determine the required gutter width, where *T* stands for the wire-bending space, *M* stands for the main conductors, and *BC* stands for the branch circuit conductors.

T_1 is required to be 7½ inches based on conductors *M*, which are parallel 4/0 conductors.

T_2 is required to be 1½ inches based on conductors BC_2 , which are 6 AWG.

T_3 is required to be 4½ inches, based on conductors BC_3 , which are 1 AWG.

T_4 is required to be 7 inches, based on conductor *N*, which is 4/0 AWG.

Table 312.6(B), Note 2, permits a reduction in required bending space for removable and lay-in wire terminals. The removable terminal wire connectors can be either the compression type or the setscrew type. However, connectors are required to be of the type intended for a single conductor (single barrel). Removable connectors designed for multiple wires are not permitted to have a reduction in bending space.

A lay-in wire terminal is a pressure wire connector in which part of the connector is removable or swings away so that the stripped end of the conductor can be laid into the fixed portion of the connector. The removable or swing-away portion is then put back in place and the connector tightened down on the conductor.

Exhibit 312.2 illustrates the conditions under which 312.6(B)(2), Exception No. 2, is applicable. The terminal on the left has an offset not greater than 50 percent of bending space, per condition (b) of Exception No. 2. The terminal on the right is within a 45-degree angle of the enclosure wall, per condition (a) of Exception No. 2.

See also

Table 430.10(B) and Exhibit 430.1 for an example of wire-bending space in enclosures for motor controllers

(C) Conductors 4 AWG or Larger. Installation shall comply with 300.4(G).

312.7 Space in Enclosures. Cabinets and cutout boxes shall have approved space to accommodate all conductors installed in them without crowding.

312.8 Switch and Overcurrent Device Enclosures. The wiring space within enclosures for switches and overcurrent devices shall be permitted for other wiring and equipment subject to limitations for specific equipment as provided in (A) and (B).

(A) Splices, Taps, and Feed-Through Conductors. The wiring space of enclosures for switches or overcurrent devices shall

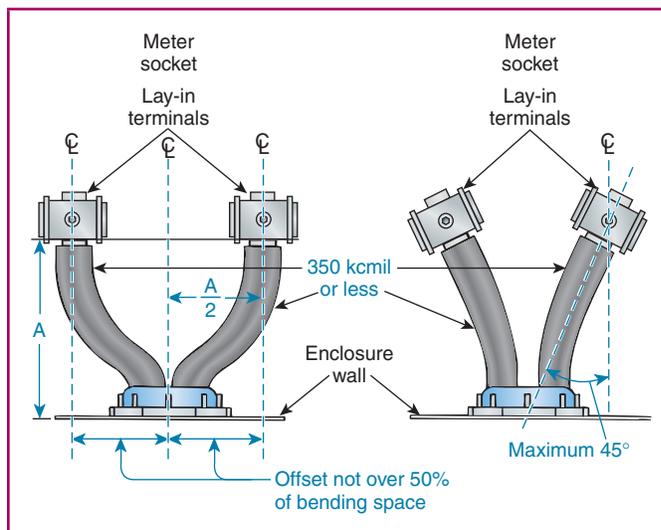

EXHIBIT 312.2 Wiring in a meter socket with lay-in wire terminals.

be permitted for conductors feeding through, spliced, or tapping off to other enclosures, switches, or overcurrent devices where all of the following conditions are met:

- (1) The total of all conductors installed at any cross section of the wiring space does not exceed 40 percent of the cross-sectional area of that space.
- (2) The total area of all conductors, splices, and taps installed at any cross section of the wiring space does not exceed 75 percent of the cross-sectional area of that space.
- (3) A warning label complying with 110.21(B) is applied to the enclosure that identifies the closest disconnecting means for any feed-through conductors.

The following application example shows a volume calculation used for splices, taps, or feed-through conductors.

Application Example

An enclosure having a wiring space of 4 in. wide by 3 in. deep has a cross-sectional area of 12 in.² Thus, the total conductor fill (see Chapter 9, Table 5, for dimensions of conductors) at any cross section cannot exceed 4.8 in.² (40 percent of 12 in.²), and the maximum space for conductors and splices or taps at any cross section cannot exceed 9 in.² (75 percent of 12 in.²).

(B) Power Monitoring Equipment. The wiring space of enclosures for switches or overcurrent devices shall be permitted to contain power monitoring equipment where all of the following conditions are met:

- (1) The power monitoring equipment is identified as a field installable accessory as part of the listed equipment, or is a listed kit evaluated for field installation in switch or overcurrent device enclosures.

- (2) The total area of all conductors, splices, taps, and equipment at any cross section of the wiring space does not exceed 75 percent of the cross-sectional area of that space.

Many new devices are used for power monitoring that are intended to be installed in enclosures containing panelboards, which are often not supplied by the panelboard manufacturer. Much of this equipment is used for load monitoring and energy management. This section provides requirements used to determine if the addition of devices and/or equipment is acceptable. The inclusion of devices and equipment in a wiring space is limited to those that are identified as field installable accessories as part of the listed equipment or as a listed kit evaluated for field installation in the specific equipment.

312.9 Side or Back Wiring Spaces or Gutters. Cabinets and cutout boxes shall be provided with back-wiring spaces, gutters, or wiring compartments as required by 312.11(C) and (D).

Part II. Construction Specifications

312.10 Material. Cabinets, cutout boxes, and meter socket enclosures shall comply with 312.10(A) through (C).

(A) Metal Cabinets and Cutout Boxes. Metal enclosures within the scope of this article shall be protected both inside and outside against corrosion.

(B) Strength. The design and construction of enclosures within the scope of this article shall be such as to secure ample strength and rigidity. If constructed of sheet steel, the metal thickness shall not be less than 1.35 mm (0.053 in.) uncoated.

(C) Nonmetallic Cabinets. Nonmetallic cabinets shall be listed, or they shall be submitted for approval prior to installation.

312.11 Spacing. The spacing within cabinets and cutout boxes shall comply with 312.11(A) through (D).

(A) General. Spacing within cabinets and cutout boxes shall provide approved spacing for the distribution of wires and cables placed in them and for a separation between metal parts of devices and apparatus mounted within them in accordance with 312.11(A)(1), (A)(2), and (A)(3).

(1) Base. Other than at points of support, there shall be an airspace of at least 1.59 mm (0.0625 in.) between the base of the device and the wall of any metal cabinet or cutout box in which the device is mounted.

(2) Doors. There shall be an airspace of at least 25.4 mm (1.00 in.) between any live metal part, including live metal parts of enclosed fuses, and the door.

Exception: Where the door is lined with an approved insulating material or is of a thickness of metal not less than 2.36 mm (0.093 in.) uncoated, the airspace shall not be less than 12.7 mm (0.500 in.).

(3) Live Parts. There shall be an airspace of at least 12.7 mm (0.500 in.) between the walls, back, gutter partition, if of metal, or

door of any cabinet or cutout box and the nearest exposed current-carrying part of devices mounted within the cabinet where the voltage does not exceed 250. This spacing shall be increased to at least 25.4 mm (1.00 in.) for voltages of 251 to 1000, nominal.

Exception: Where the conditions in 312.11(A)(2), Exception, are met, the airspace for nominal voltages from 251 to 600 shall be permitted to be not less than 12.7 mm (0.500 in.).

(B) Switch Clearance. Cabinets and cutout boxes shall be deep enough to allow the closing of the doors when 30-ampere branch-circuit panelboard switches are in any position, when combination cutout switches are in any position, or when other single-throw switches are opened as far as their construction permits.

(C) Wiring Space. Cabinets and cutout boxes that contain devices or apparatus connected within the cabinet or box to more than eight conductors, including those of branch circuits, meter loops, feeder circuits, power circuits, and similar circuits, but not including the supply circuit or a continuation thereof, shall have back-wiring spaces or one or more side-wiring spaces, side gutters, or wiring compartments.

(D) Wiring Space — Enclosure. Side-wiring spaces, side gutters, or side-wiring compartments of cabinets and cutout boxes shall be made tight enclosures by means of covers, barriers, or partitions extending from the bases of the devices contained in the cabinet, to the door, frame, or sides of the cabinet.

Exception: Side-wiring spaces, side gutters, and side-wiring compartments of cabinets shall not be required to be made tight enclosures where those side spaces contain only conductors that enter the cabinet directly opposite to the devices where they terminate.

Partially enclosed back-wiring spaces shall be provided with covers to complete the enclosure. Wiring spaces that are required by 312.11(C) and are exposed when doors are open shall be provided with covers to complete the enclosure. Where space is provided for feed-through conductors and for splices as required in 312.8, additional barriers shall not be required.

Part I. Scope and General

314.1 Scope. This article covers the installation and use of all boxes and conduit bodies used as outlet, device, junction, or pull boxes, depending on their use, and handhole enclosures. Cast metal, sheet metal, nonmetallic, and other boxes such as FS, FD, and larger boxes are not classified as conduit bodies. This article also includes installation requirements for fittings used to join raceways and to connect raceways and cables to boxes and conduit bodies.

314.2 Round Boxes. Round boxes shall not be used where conduits or connectors requiring the use of locknuts or bushings are to be connected to the side of the box.

Rectangular or octagonal boxes have a flat bearing surface at each knockout for locknuts and bushings to ensure effective grounding continuity. Round boxes can be used if the cable does not require attachment to the box, as permitted by 314.17(C), Exception.

314.3 Nonmetallic Boxes. Nonmetallic boxes shall be permitted only with open wiring on insulators, concealed knob-and-tube wiring, cabled wiring methods with entirely nonmetallic sheaths, flexible cords, and nonmetallic raceways.

Exception No. 1: Where internal bonding means are provided between all entries, nonmetallic boxes shall be permitted to be used with metal raceways or metal-armored cables.

This exception applies to nonmetallic boxes without threaded entries and permits the use of metal raceways and metal-armored cables with nonmetallic boxes. Internal bonding means must be installed to ensure ground continuity between the metal raceways or metal-armored cables. For the purposes of this exception, the term *metal-armored cable* includes other cables with a metal covering such as metal-sheathed, mineral-insulated cable (Type MI), metal-clad cable (Type MC), and armored cable (Type AC).

Exception No. 2: Where integral bonding means with a provision for attaching an equipment bonding jumper inside the box are provided between all threaded entries in nonmetallic boxes listed for the purpose, nonmetallic boxes shall be permitted to be used with metal raceways or metal-armored cables.

314.4 Metal Boxes. Metal boxes shall be grounded and bonded in accordance with **Parts I, IV, V, VI, VII, and X** of **Article 250** as applicable, except as permitted in **250.112(I)**.

Part II. Installation

314.15 Damp or Wet Locations. In damp or wet locations, boxes, conduit bodies, outlet box hoods, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the box, conduit body, or fitting. Boxes, conduit bodies, outlet box hoods, and fittings installed in wet locations shall be listed for use in wet locations. Approved drainage openings not smaller than 3 mm ($\frac{1}{8}$ in.) and not larger than 6 mm ($\frac{1}{4}$ in.) in diameter shall be permitted to be installed in the field in boxes or conduit bodies listed for use in damp or wet locations. For installation of listed drain fittings, larger openings are permitted to be installed in the field in accordance with manufacturer's instructions.

Informational Note No. 1: For boxes in floors, see **314.27(B)**.

Informational Note No. 2: For protection against corrosion, see **300.6**.

Wet locations include those where the boxes, fittings, or conduit bodies are exposed to weather. If drain holes are needed, this section specifies a minimum drain size because of concern that drains could become blocked with debris over time.

Article 100 definitions of *location, damp* and *location, wet*, as well as the commentary following the definition of *enclosure*, for further explanation

314.16 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies. Boxes and conduit bodies shall be of an approved size to provide free space for all enclosed conductors. In no case shall the volume of the box, as calculated in **314.16(A)**, be less than the fill calculation as calculated in

314.16(B). The minimum volume for conduit bodies shall be as calculated in **314.16(C)**.

The provisions of this section shall not apply to terminal housings supplied with motors or generators.

Informational Note: For volume requirements of motor or generator terminal housings, see **430.12**.

Boxes and conduit bodies enclosing conductors 4 AWG or larger shall also comply with the provisions of **314.28**.

(A) Box Volume Calculations. The volume of a wiring enclosure (box) shall be the total volume of the assembled sections and, where used, the space provided by plaster rings, domed covers, extension rings, and so forth, that are marked with their volume or are made from boxes the dimensions of which are listed in **Table 314.16(A)**. Where a box is provided with one or more securely installed barriers, the volume shall be apportioned to each of the resulting spaces. Each barrier, if not marked with its volume, shall be considered to take up 8.2 cm³ ($\frac{1}{2}$ in³) if metal, and 16.4 cm³ (1.0 in³) if nonmetallic.

(1) Standard Boxes. The volumes of standard boxes that are not marked with their volume shall be as given in **Table 314.16(A)**.

(2) Other Boxes. Boxes 1650 cm³ (100 in.³) or less, other than those described in **Table 314.16(A)**, and nonmetallic boxes shall be durably and legibly marked by the manufacturer with their volume(s). Boxes described in **Table 314.16(A)** that have a volume larger than is designated in the table shall be permitted to have their volume marked as required by this section.

(B) Box Fill Calculations. The volumes in paragraphs **314.16(B)(1)** through **(B)(5)**, as applicable, shall be added together. No allowance shall be required for small fittings such as locknuts and bushings. Each space within a box installed with a barrier shall be calculated separately.

(1) Conductor Fill. Each conductor that originates outside the box and terminates or is spliced within the box shall be counted once, and each conductor that passes through the box without splice or termination shall be counted once. Each loop or coil of unbroken conductor not less than twice the minimum length required for free conductors in **300.14** shall be counted twice. The conductor fill shall be calculated using **Table 314.16(B)**. A conductor, no part of which leaves the box, shall not be counted.

Exception: An equipment grounding conductor or conductors or not over four fixture wires smaller than 14 AWG, or both, shall be permitted to be omitted from the calculations where they enter a box from a domed luminaire or similar canopy and terminate within that box.

(2) Clamp Fill. Where one or more internal cable clamps, whether factory or field supplied, are present in the box, a single volume allowance in accordance with **Table 314.16(B)** shall be made based on the largest conductor present in the box. No allowance shall be required for a cable connector with its clamping mechanism outside the box.

*Where no volume allowances are required by 314.16(B)(2) through (B)(5).

TABLE 314.16(B) Volume Allowance Required per Conductor

Size of Conductor (AWG)	Free Space Within Box for Each Conductor	
	cm ³	in. ³
18	24.6	1.50
16	28.7	1.75
14	32.8	2.00
12	36.9	2.25
10	41.0	2.50
8	49.2	3.00
6	81.9	5.00

A clamp assembly that incorporates a cable termination for the cable conductors shall be listed and marked for use with specific nonmetallic boxes. Conductors that originate within the clamp assembly shall be included in conductor fill calculations covered in 314.16(B)(1) as though they entered from outside the box. The clamp assembly shall not require a fill allowance, but

the volume of the portion of the assembly that remains within the box after installation shall be excluded from the box volume as marked in 314.16(A)(2).

(3) Support Fittings Fill. Where one or more luminaire studs or hickies are present in the box, a single volume allowance in accordance with Table 314.16(B) shall be made for each type of fitting based on the largest conductor present in the box.

(4) Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on the largest conductor connected to a device(s) or equipment supported by that yoke or strap. A device or utilization equipment wider than a single 50 mm (2 in.) device box as described in Table 314.16(A) shall have double volume allowances provided for each gang required for mounting.

(5) Equipment Grounding Conductor Fill. Where one or more equipment grounding conductors or equipment bonding jumpers enter a box, a single volume allowance in accordance with Table 314.16(B) shall be made based on the largest

equipment grounding conductor or equipment bonding jumper present in the box. Where an additional set of equipment grounding conductors, as permitted by 250.146(D), is present in the box, an additional volume allowance shall be made based on the largest equipment grounding conductor in the additional set.

This section requires that the total box “volume” be equal to or greater than the total box “fill.” The total box volume is determined by adding the individual volumes of the box components. The components include the box itself plus any attachments to it, such as a plaster ring, an extension ring, or a dome cover. The volume of each component is determined either from

the volume marking on the component itself or from the standard volumes listed in Table 314.16(A). If a box is marked with a volume larger than listed in Table 314.16(A), the larger volume can be used instead of the table value. If a box contains one or more securely installed dividers, the volume would be apportioned among the resulting spaces. However, the space occupied by the divider must be considered when calculating box fill.

Adding all the volume allowances for all items contributing to box fill determines the total box fill. The volume allowance for each fill item is based on the volume listed in Table 314.16(B) for the conductor size indicated. Commentary Table 314.1 summarizes the components contributing to box fill.

COMMENTARY TABLE 314.1 Summary of Items Contributing to Box Fill

Items Contained Within Box	Volume Allowance	Based on [see Table 314.16(B)]
Conductors that originate outside box	One for each conductor	Actual conductor size
Conductors that pass through box without splice or connection (less than 12 in. in total length)	One for each conductor	Actual conductor size
Conductors 12 in. or greater that are looped (or coiled) and unbroken (see 300.14 for exact measurement)	Two for a single (entire) unbroken conductor	Actual conductor size
Conductors that originate within box and do not leave box	None (these conductors not counted)	n.a.
Fixture wires [per 314.16(B)(1), Exception]	None (these conductors not counted)	n.a.
Internal cable clamps (one or more)	One only	Largest-sized conductor present
Support fittings (such as luminaire studs or hickey)	One for each type of support fitting	Largest-sized conductor present
Devices (such as receptacles, switches) or utilization equipment (such as timers, dimmers, AFCI receptacles, GFCI receptacles, TVSS receptacles)	Two for each yoke or mounting strap	Largest-sized conductor connected to device or utilization equipment
Equipment grounding conductor (one or more)	One only	Largest equipment grounding conductor present
Isolated equipment grounding conductor (one or more) [see 250.146(D)]	One only	Largest isolated and insulated equipment grounding conductor present

n.a. = not applicable.

Calculation Example 1

For this example, as shown in Exhibit 314.1, the box does not contain any cable clamps, support fittings, devices, or equipment grounding conductors.

Solution

To determine the minimum standard-sized, square, metal box for the number of 12 AWG conductors being installed, count the conductors and compare the total to the maximum number of conductors permitted by Table 314.16(A). Each unspliced conductor running through the box is counted as one conductor, and each other conductor is counted as one conductor. Therefore, the total conductor count is nine. Table 314.16(A) indicates that the maximum fill for standard 4 in. × 1½ in. square box is nine 12 AWG conductors. The minimum standard square box size is 21 in.³

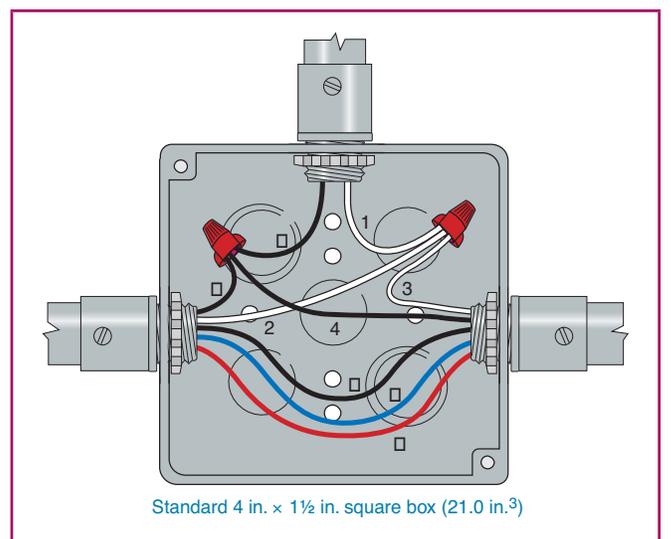

EXHIBIT 314.1 A standard-sized square box containing no fittings or devices, such as luminaire studs, cable clamps, switches, receptacles, or EGCs.

Calculation Example 2

The standard method for determining adequate box size calculates the total box volume first and then subtracts the total box fill to ensure compliance. Using this method, determine whether the box in **Exhibit 314.2** is adequately sized.

Solution

Table 314.16(A) shows the minimum volume of a standard 3 in. × 2 in. × 3½ in. device box to be 18 in.³ The box fill for this situation as given in **Commentary Table 314.2** is 16 in.³ Because the total box fill of 16 in.³ is less than the 18 in.³ total box volume, the box is adequately sized.

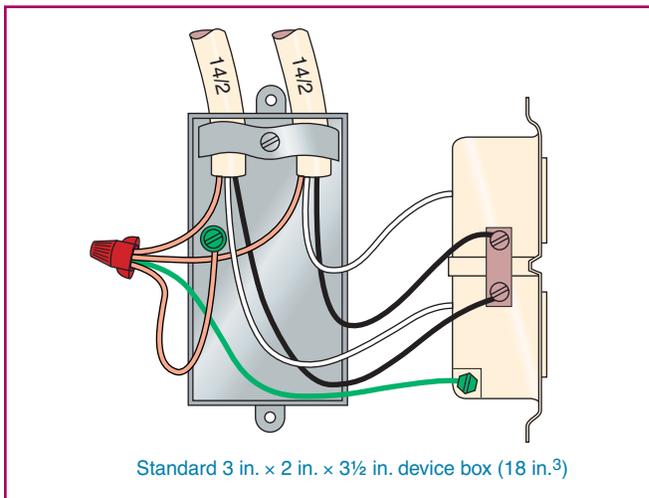

EXHIBIT 314.2 A standard-sized device box containing a device and conductors requiring deductions.

COMMENTARY TABLE 314.2 Total Box Fill for Example 2

Items Contained Within Box	Volume Allowance	Unit Volume Based on Table 314.16(B) (in. ³)	Total Box Fill (in. ³)
4 conductors	4 volume allowances for 14 AWG conductors	2.00	8.00
1 clamps	1 volume allowance (based on 14 AWG conductors)	2.00	2.00
1 devices	2 volume allowances (based on 14 AWG conductors)	2.00	4.00
Equipment grounding conductors (all)	1 volume allowance (based on 14 AWG conductors)	2.00	2.00
Total			16.00

Calculation Example 3

Using the standard method, determine the adequacy of the device box illustrated in **Exhibit 314.3**, where two standard-sized 3 in. × 2 in. × 3½ in. device boxes are ganged to form a single box.

Solution

Table 314.16(A) shows that the minimum volume for a single box is 18 in.³ Thus, the total box volume for the ganged box is 36 in.³ The total box fill, based on **Table 314.16(B)**, is determined as given in **Commentary Table 314.3**. With only 26 in.³ of the 36 in.³ filled, the box is adequately sized.

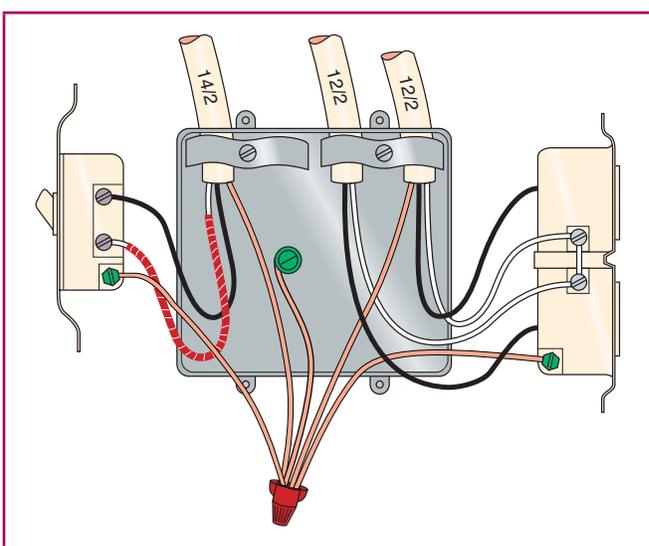

EXHIBIT 314.3 Two standard ganged device boxes containing conductors of different sizes.

COMMENTARY TABLE 314.3 Total Box Fill for Example 3

Items Contained Within Box	Volume Allowance	Unit Volume Based on Table 314.16(B) (in. ³)	Total Box Fill (in. ³)
6 conductors	2 volume allowances for 14 AWG conductors	2.00	4.00
	4 volume allowances for 12 AWG conductors	2.25	9.00
2 clamps	1 volume allowance (based on 12 AWG conductors)	2.25	2.25
2 devices	2 volume allowances (based on 14 AWG conductors)	2.00	4.00
	2 volume allowances (based on 12 AWG conductors)	2.25	4.50
Equipment grounding conductors (all)	1 volume allowance (based on 12 AWG conductors)	2.25	2.25
Total			26.00

(C) Conduit Bodies.

(1) General. Conduit bodies enclosing 6 AWG conductors or smaller, other than short-radius conduit bodies as described in 314.16(C)(3), shall have a cross-sectional area not less than twice the cross-sectional area of the largest conduit or tubing to which they can be attached. The maximum number of conductors permitted shall be the maximum number permitted by Table 1 of Chapter 9 for the conduit or tubing to which it is attached.

(2) With Splices, Taps, or Devices. Only those conduit bodies that are durably and legibly marked by the manufacturer with their volume shall be permitted to contain splices, taps, or devices. The maximum number of conductors shall be calculated in accordance with 314.16(B). Conduit bodies shall be supported in a rigid and secure manner.

As illustrated in Exhibit 314.4, conduit bodies are required to have a cross sectional area not less than twice that of the conduit to which they are attached and are not permitted to contain more conductors than the attached raceway. Conduit bodies must be rigidly supported.

See also

314.23 for support requirements

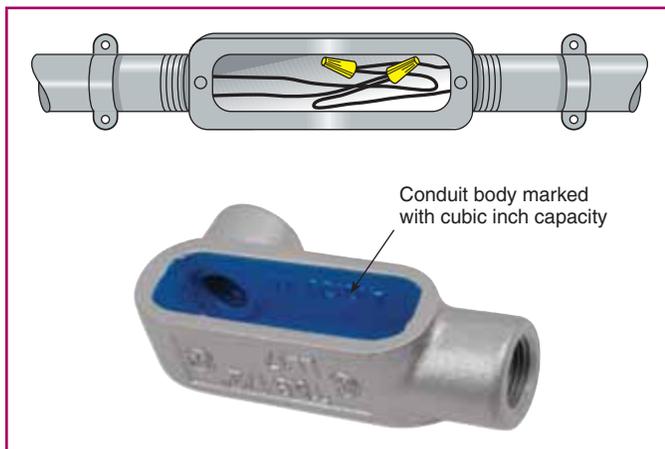

EXHIBIT 314.4 An example of permitted splices in a raceway-supported conduit body. (Image Courtesy of Thomas & Betts)

(3) Short Radius Conduit Bodies. Conduit bodies such as capped elbows and service-entrance elbows that enclose conductors 6 AWG or smaller, and are only intended to enable the installation of the raceway and the contained conductors, shall not contain splices, taps, or devices and shall be of an approved size to provide free space for all conductors enclosed in the conduit body.

314.17 Conductors Entering Boxes, Conduit Bodies, or Fittings. Conductors entering boxes, conduit bodies, or fittings shall be protected from abrasion and shall comply with 314.17(A) through (D).

(A) Openings to Be Closed. Openings through which conductors enter shall be closed in an approved manner.

(B) Metal Boxes and Conduit Bodies. Where metal boxes or conduit bodies are installed with messenger supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, conductors shall enter through insulating bushings or, in dry locations, through flexible tubing extending from the last insulating support to not less than 6 mm (1/4 in.) inside the box and beyond any cable clamps. Where nonmetallic-sheathed cable or multiconductor Type UF cable is used, the sheath shall extend not less than 6 mm (1/4 in.) inside the box and beyond any cable clamp. Except as provided in 300.15(C), the wiring shall be firmly secured to the box or conduit body. Where raceway or cable is installed with metal boxes or conduit bodies, the raceway or cable shall be secured to such boxes and conduit bodies.

(C) Nonmetallic Boxes and Conduit Bodies. Nonmetallic boxes and conduit bodies shall be suitable for the lowest temperature-rated conductor entering the box. Where nonmetallic boxes and conduit bodies are used with messenger-supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, the conductors shall enter the box through individual holes. Where flexible tubing is used to enclose the conductors, the tubing shall extend from the last insulating support to not less than 6 mm (1/4 in.) inside the box and beyond any cable clamp. Where nonmetallic-sheathed cable or multiconductor Type UF cable is used, the sheath shall extend not less than 6 mm (1/4 in.) inside the box and beyond any cable clamp. In all instances, all permitted wiring methods shall be secured to the boxes.

EXHIBIT 314.5 Installation of a single gang outlet with cables securely fastened within 8 inches of the box. (Courtesy of the International Association of Electrical Inspectors)

Standard nonmetallic boxes are permitted for use with 90°C insulated conductors. A nonmetallic box used for splicing a conductor of a higher temperature rating to a conductor of a lower temperature rating is required to be identified as suitable for the temperature rating of the lower-rated conductor because the maximum temperature permitted will be that of the lower-rated conductor. The intent is to avoid the necessity of giving a high temperature rating to boxes in a normal temperature location simply because high-temperature conductors enter the box from or exit to a high-temperature location. However, where insulated conductors rated at higher temperatures are necessary in a high-temperature environment, the box is required to be identified by a marking on the box or in the listing of the box to comply with 110.3(B).

Exception: Where nonmetallic-sheathed cable or multiconductor Type UF cable is used with single gang boxes not larger than a nominal size 57 mm × 100 mm (2¼ in. × 4 in.) mounted in walls or ceilings, and where the cable is fastened within 200 mm (8 in.) of the box measured along the sheath and where the sheath extends through a cable knockout not less than 6 mm (¼ in.), securing the cable to the box shall not be required. Multiple cable entries shall be permitted in a single cable knockout opening.

Exhibit 314.5 is an example of an installation that complies with 314.17(C), Exception.

(D) Conductors 4 AWG or Larger. Installation shall comply with 300.4(G).

Informational Note: See 110.12(A) for requirements on closing unused cable and raceway knockout openings.

314.19 Boxes Enclosing Flush Devices. Boxes used to enclose flush devices shall be of such design that the devices will be completely enclosed on back and sides and substantial support for the devices will be provided. Screws for supporting the box shall not also be used to attach a device.

314.20 Flush-Mounted Installations. Installations within or behind a surface of concrete, tile, gypsum, plaster, or other non-combustible material, including boxes employing a flush-type cover or faceplate, shall be made so that the front edge of the box, plaster ring, extension ring, or listed extender will not be set back of the finished surface more than 6 mm (¼ in.).

Installations within a surface of wood or other combustible surface material, boxes, plaster rings, extension rings, or listed extenders shall extend to the finished surface or project therefrom.

This section applies only to the construction of the finished surface of the wall or ceiling and not to its structure or subsurface. It is important that the final finished surface, such as a tiled kitchen backsplash, be considered before outlet boxes are installed.

314.21 Repairing Noncombustible Surfaces. Noncombustible surfaces that are broken or incomplete around boxes employing a flush-type cover or faceplate shall be repaired so there will be no gaps or open spaces greater than 3 mm (⅛ in.) at the edge of the box.

314.22 Surface Extensions. Surface extensions shall be made by mounting and mechanically securing an extension ring over the box. Equipment grounding shall be in accordance with Part VI of Article 250.

Exception: A surface extension shall be permitted to be made from the cover of a box where the cover is designed so it is unlikely to fall off or be removed if its securing means becomes loose. The wiring method shall be flexible for an approved length that permits removal of the cover and provides access to the box interior and shall be arranged so that any grounding continuity is independent of the connection between the box and cover.

Grounding continuity must not rely on the means to secure the cover to the box.

314.23 Supports. Enclosures within the scope of this article shall be supported in accordance with one or more of the provisions in 314.23(A) through (H).

(A) Surface Mounting. An enclosure mounted on a building or other surface shall be rigidly and securely fastened in place. If the surface does not provide rigid and secure support, additional support in accordance with other provisions of this section shall be provided.

(B) Structural Mounting. An enclosure supported from a structural member or from grade shall be rigidly supported either directly or by using a metal, polymeric, or wood brace.

(1) Nails and Screws. Nails and screws, where used as a fastening means, shall secure boxes by using brackets on the outside of the enclosure, or by using mounting holes in the back or in a single side of the enclosure, or they shall pass through the interior within 6 mm (¼ in.) of the back or ends of the enclosure. Screws

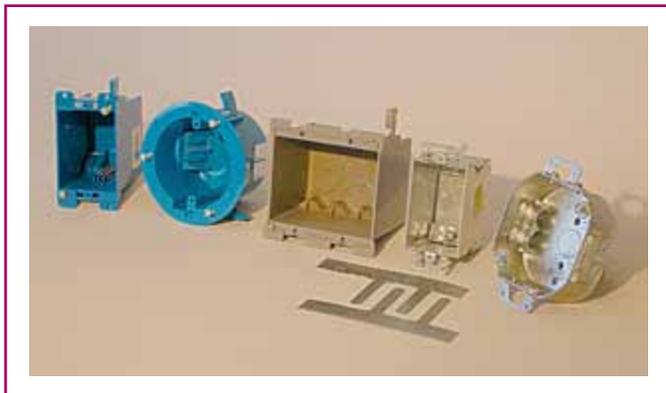

EXHIBIT 314.6 Metal and nonmetallic outlet boxes designed for mounting in finished wall and ceiling surfaces.

shall not be permitted to pass through the box unless exposed threads in the box are protected using approved means to avoid abrasion of conductor insulation. Mounting holes made in the field shall be approved.

(2) **Braces.** Metal braces shall be protected against corrosion and formed from metal that is not less than 0.51 mm (0.020 in.) thick uncoated. Wood braces shall have a cross section not less than nominal 25 mm × 50 mm (1 in. × 2 in.). Wood braces in wet locations shall be treated for the conditions. Polymeric braces shall be identified as being suitable for the use.

(C) **Mounting in Finished Surfaces.** An enclosure mounted in a finished surface shall be rigidly secured thereto by clamps, anchors, or fittings identified for the application.

Where structural members are lacking or where boxes are cut into existing walls, boxes are permitted to be secured by clamps or anchors. Exhibit 314.6 shows several examples of “old work” boxes that are designed to be installed into a finished wall or ceiling. The three nonmetallic boxes have mounting tabs that secure to the back of the finished surface as the screws on the front of the box are tightened. The metal boxes have mounting tabs that are designed to accept screws that secure the box to a surface such as wood paneling or wainscoting. The metal brackets shown can be used to secure a box to a wall surface such as gypsum wall board.

(D) **Suspended Ceilings.** An enclosure mounted to structural or supporting elements of a suspended ceiling shall be not more than 1650 cm³ (100 in.³) in size and shall be securely fastened in place in accordance with either 314.23(D)(1) or (D)(2).

(1) **Framing Members.** An enclosure shall be fastened to the framing members by mechanical means such as bolts, screws, or rivets, or by the use of clips or other securing means identified for use with the type of ceiling framing member(s) and enclosure(s) employed. The framing members shall be supported in an approved manner and securely fastened to each other and to the building structure.

(2) **Support Wires.** The installation shall comply with the provisions of 300.11(A). The enclosure shall be secured, using

identified methods, to ceiling support wire(s), including any additional support wire(s) installed for ceiling support. Support wire(s) used for enclosure support shall be fastened at each end so as to be taut within the ceiling cavity.

(E) **Raceway-Supported Enclosure, Without Devices, Luminaires, or Lampholders.** An enclosure that does not contain a device(s), other than splicing devices, or supports a luminaire(s), a lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm³ (100 in.³) in size. It shall have threaded entries or identified hubs. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 900 mm (3 ft) of the enclosure, or within 450 mm (18 in.) of the enclosure if all conduit entries are on the same side.

Boxes are not permitted to be supported by rigid raceways using locknuts and bushings. A box is not permitted to be supported by a single raceway.

Exception: The following wiring methods shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided that the trade size of the conduit body is not larger than the largest trade size of the conduit or tubing:

- (1) Intermediate metal conduit, Type IMC
- (2) Rigid metal conduit, Type RMC
- (3) Rigid polyvinyl chloride conduit, Type PVC
- (4) Reinforced thermosetting resin conduit, Type RTRC
- (5) Electrical metallic tubing, Type EMT

(F) **Raceway-Supported Enclosures, with Devices, Luminaires, or Lampholders.** An enclosure that contains a device(s), other than splicing devices, or supports a luminaire(s), a lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm³ (100 in.³) in size. It shall have threaded entries or identified hubs. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 450 mm (18 in.) of the enclosure.

Exception No. 1: Rigid metal or intermediate metal conduit shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit.

Exception No. 2: An unbroken length(s) of rigid or intermediate metal conduit shall be permitted to support a box used for luminaire or lampholder support, or to support a wiring enclosure that is an integral part of a luminaire and used in lieu of a box in accordance with 300.15(B), where all of the following conditions are met:

- (1) The conduit is securely fastened at a point so that the length of conduit beyond the last point of conduit support does not exceed 900 mm (3 ft).
- (2) The unbroken conduit length before the last point of conduit support is 300 mm (12 in.) or greater, and that portion of

the conduit is securely fastened at some point not less than 300 mm (12 in.) from its last point of support.

- (3) Where accessible to unqualified persons, the luminaire or lampholder, measured to its lowest point, is at least 2.5 m (8 ft) above grade or standing area and at least 900 mm (3 ft) measured horizontally to the 2.5 m (8 ft) elevation from windows, doors, porches, fire escapes, or similar locations.
- (4) A luminaire supported by a single conduit does not exceed 300 mm (12 in.) in any direction from the point of conduit entry.
- (5) The weight supported by any single conduit does not exceed 9 kg (20 lb).
- (6) At the luminaire or lampholder end, the conduit(s) is threaded wrenchtight into the box, conduit body, integral wiring enclosure, or identified hubs. Where a box or conduit body is used for support, the luminaire shall be secured directly to the box or conduit body, or through a threaded conduit nipple not over 75 mm (3 in.) long.

(G) Enclosures in Concrete or Masonry. An enclosure supported by embedment shall be identified as suitably protected from corrosion and securely embedded in concrete or masonry.

Boxes are permitted to be embedded in masonry or concrete, provided they are rigid and secure. Corrosion protection is required due to the corrosive effects of concrete. Exhibit 314.7 shows a galvanized box installed in a brick wall. Additional support is not required.

(H) Pendant Boxes. An enclosure supported by a pendant shall comply with 314.23(H)(1) or (H)(2).

EXHIBIT 314.7 A galvanized box installed in a brick wall. (Courtesy of the International Association of Electrical Inspectors)

(1) Flexible Cord. A box shall be supported from a multi-conductor cord or cable in an approved manner that protects the conductors against strain, such as a strain-relief connector threaded into a box with a hub.

(2) Conduit. A box supporting lampholders or luminaires, or wiring enclosures within luminaires used in lieu of boxes in accordance with 300.15(B), shall be supported by rigid or intermediate metal conduit stems. For stems longer than 450 mm (18 in.), the stems shall be connected to the wiring system with flexible fittings suitable for the location. At the luminaire end, the conduit(s) shall be threaded wrenchtight into the box, wiring enclosure, or identified hubs.

Where supported by only a single conduit, the threaded joints shall be prevented from loosening by the use of set-screws or other effective means, or the luminaire, at any point, shall be at least 2.5 m (8 ft) above grade or standing area and at least 900 mm (3 ft) measured horizontally to the 2.5 m (8 ft) elevation from windows, doors, porches, fire escapes, or similar locations. A luminaire supported by a single conduit shall not exceed 300 mm (12 in.) in any horizontal direction from the point of conduit entry.

These requirements are addressing field installation of pendants mounted on boxes. Flexible fittings, such as a ball and socket supporting a pendant, as shown in Exhibit 314.8, must be installed on the box for stems longer than 18 inches.

314.24 Depth of Boxes. Outlet and device boxes shall have an approved depth to allow equipment installed within them to be mounted properly and without likelihood of damage to conductors within the box.

(A) Outlet Boxes Without Enclosed Devices or Utilization Equipment. Outlet boxes that do not enclose devices or

EXHIBIT 314.8 Flexible fitting for stems longer than 18 inches. (Courtesy of Hubbell Incorporated)

utilization equipment shall have a minimum internal depth of 12.7 mm ($\frac{1}{2}$ in.).

(B) Outlet and Device Boxes with Enclosed Devices or Utilization Equipment. Outlet and device boxes that enclose devices or utilization equipment shall have a minimum internal depth that accommodates the rearward projection of the equipment and the size of the conductors that supply the equipment. The internal depth shall include, where used, that of any extension boxes, plaster rings, or raised covers. The internal depth shall comply with all applicable provisions of 314.24(B)(1) through (B)(5).

In addition to meeting minimum depth requirements, the box selection must be based on its having sufficient cubic-inch capacity.

(1) Large Equipment. Boxes that enclose devices or utilization equipment that projects more than 48 mm ($1\frac{7}{8}$ in.) rearward from the mounting plane of the box shall have a depth that is not less than the depth of the equipment plus 6 mm ($\frac{1}{4}$ in.).

(2) Conductors Larger Than 4 AWG. Boxes that enclose devices or utilization equipment supplied by conductors larger than 4 AWG shall be identified for their specific function.

Exception to (2): Devices or utilization equipment supplied by conductors larger than 4 AWG shall be permitted to be mounted on or in junction and pull boxes larger than 1650 cm³ (100 in.³) if the spacing at the terminals meets the requirements of 312.6.

(3) Conductors 8, 6, or 4 AWG. Boxes that enclose devices or utilization equipment supplied by 8, 6, or 4 AWG conductors shall have an internal depth that is not less than 52.4 mm ($2\frac{1}{16}$ in.).

(4) Conductors 12 or 10 AWG. Boxes that enclose devices or utilization equipment supplied by 12 or 10 AWG conductors shall have an internal depth that is not less than 30.2 mm ($1\frac{3}{16}$ in.). Where the equipment projects rearward from the mounting plane of the box by more than 25 mm (1 in.), the box shall have a depth not less than that of the equipment plus 6 mm ($\frac{1}{4}$ in.).

(5) Conductors 14 AWG and Smaller. Boxes that enclose devices or utilization equipment supplied by 14 AWG or smaller conductors shall have a depth that is not less than 23.8 mm ($1\frac{5}{16}$ in.).

The intent of this requirement is to prevent damage to conductors that can occur where clearance from the device or utilization equipment to the back of the box is insufficient. Where clearance is insufficient, conductors are often pinched or the insulation is damaged as the device or utilization equipment is pushed into the box.

Examples of utilization equipment often located within an outlet or device box include speakers, timers, motion detectors, alarms, and video and audio surveillance equipment. Typically, minimum box dimensions are included in product installation instructions for listed utilization equipment.

Exception to (1) through (5): Devices or utilization equipment that is listed to be installed with specified boxes shall be permitted.

314.25 Covers and Canopies. In completed installations, each box shall have a cover, faceplate, lampholder, or luminaire canopy, except where the installation complies with 410.24(B). Screws used for the purpose of attaching covers, or other equipment, to the box shall be either machine screws matching the thread gauge or size that is integral to the box or shall be in accordance with the manufacturer's instructions.

(A) Nonmetallic or Metal Covers and Plates. Nonmetallic or metal covers and plates shall be permitted. Where metal covers or plates are used, they shall comply with the grounding requirements of 250.110.

Informational Note: For additional grounding requirements, see 410.42 for metal luminaire canopies, and 404.12 and 406.6(B) for metal faceplates.

(B) Exposed Combustible Wall or Ceiling Finish. Where a luminaire canopy or pan is used, any combustible wall or ceiling finish exposed between the edge of the canopy or pan and the outlet box shall be covered with noncombustible material if required by 410.23.

Because heat from a short circuit, ground fault, or due to overlamping could create a fire hazard within a luminaire canopy or pan, any exposed combustible wall or ceiling space exceeding 1160 mm² (180 in.²) between the edge of the outlet box and the perimeter of the luminaire is required to be covered with noncombustible material. The noncombustible material need not be metal. Glass fiber pads, commonly provided as thermal barriers within the ceiling pan of luminaires, are an essential thermal barrier, but it does not serve in place of a noncombustible wall covering. Where the wall or ceiling finish is concrete, tile, gypsum, plaster, or other noncombustible material, the requirements of this section do not apply.

(C) Flexible Cord Pendants. Covers of outlet boxes and conduit bodies having holes through which flexible cord pendants pass shall be provided with identified bushings or shall have smooth, well-rounded surfaces on which the cords may bear. So-called hard rubber or composition bushings shall not be used.

314.27 Outlet Boxes.

(A) Boxes at Luminaire or Lampholder Outlets. Outlet boxes or fittings designed for the support of luminaires and lampholders, and installed as required by 314.23, shall be permitted to support a luminaire or lampholder.

A listed outlet box "designed for the support of luminaires" will adequately support a luminaire weighing up to 50 pounds. However, if the box is listed for a weight other than 50 pounds, the maximum design weight must be marked on the inside of the box.

(1) Vertical Surface Outlets. Boxes used at luminaire or lampholder outlets in or on a vertical surface shall be identified and marked on the interior of the box to indicate the maximum weight of the luminaire that is permitted to be supported by the box if other than 23 kg (50 lb).

Exception: A vertically mounted luminaire or lampholder weighing not more than 3 kg (6 lb) shall be permitted to be

supported on other boxes or plaster rings that are secured to other boxes, provided that the luminaire or its supporting yoke, or the lampholder, is secured to the box with no fewer than two No. 6 or larger screws.

Device boxes designed for the mounting of snap switches, receptacles, and other devices are usually provided with 6-32 screws. They are not usually suitable for supporting other than lightweight wall-mounted luminaires.

(2) Ceiling Outlets. At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire or lampholder may be attached. Boxes shall be required to support a luminaire weighing a minimum of 23 kg (50 lb). A luminaire that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box, unless the outlet box is listed for not less than the weight to be supported. The interior of the box shall be marked by the manufacturer to indicate the maximum weight the box shall be permitted to support.

Whether a luminaire is attached to an outlet box or is supported independently of the outlet box, the supporting means of the luminaire should be securely fastened. Boxes designed as the sole support of luminaires weighing more than 50 pounds must be listed and marked with the maximum weight.

(B) Floor Boxes. Boxes listed specifically for this application shall be used for receptacles located in the floor.

Exception: Where the authority having jurisdiction judges them free from likely exposure to physical damage, moisture, and dirt, boxes located in elevated floors of show windows and similar locations shall be permitted to be other than those listed for floor applications. Receptacles and covers shall be listed as an assembly for this type of location.

(C) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall be listed, shall be marked by their manufacturer as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weigh more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weigh more than 16 kg (35 lb), the required marking shall include the maximum weight to be supported.

Where spare, separately switched, ungrounded conductors are provided to a ceiling-mounted outlet box, in a location acceptable for a ceiling-suspended (paddle) fan in one-family, two-family, or multifamily dwellings, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.

Outlet boxes specifically listed to support ceiling-mounted paddle fans are available, as are several alternative and retrofit methods that can provide suitable support for a paddle fan. Exhibit 314.9 illustrates two methods of supporting a fan from an outlet box listed for fan support. In new residential construction, it is common to provide a wall-mounted switch with wiring to allow for the future installation of paddle fans.

EXHIBIT 314.9 Two methods of supporting a ceiling fan from a listed outlet box. (Top) A listed outlet box used as the sole support of a ceiling-suspended (paddle) fan. Note the two clamps on the perimeter of the box that will support a fixture. (Courtesy of the International Association of Electrical Inspectors). (Bottom) A box listed for supporting a ceiling-suspended (paddle) fan (35 pounds or less) (Courtesy of Hubbell Incorporated)

Such installations are required to have an outlet box or outlet box system that is listed for the sole support of a fan.

(D) Utilization Equipment. Boxes used for the support of utilization equipment other than ceiling-suspended (paddle) fans shall meet the requirements of 314.27(A) for the support of a luminaire that is the same size and weight.

Exception: Utilization equipment weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the equipment or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

(E) Separable Attachment Fittings. Outlet boxes required in 314.27 shall be permitted to support listed locking support and mounting receptacles used in combination with compatible attachment fittings. The combination shall be identified for the support of equipment within the weight and mounting orientation limits of the listing. Where the supporting receptacle is installed within a box, it shall be included in the fill calculation covered in 314.16(B)(4).

This section permits a combination of a locking support and mounting receptacle mounted to an outlet box utilizing a faceplate made for the

receptacle. It allows a quick connect/disconnect for a luminaire or ceiling fans. The quick connection combination locks the device in place and supports its weight as well as acts as a load make and break mechanism.

314.28 Pull and Junction Boxes and Conduit Bodies. Boxes and conduit bodies used as pull or junction boxes shall comply with 314.28(A) through (E).

Exception: Terminal housings supplied with motors shall comply with the provisions of 430.12.

(A) Minimum Size. For raceways containing conductors of 4 AWG or larger that are required to be insulated, and for cables containing conductors of 4 AWG or larger, the minimum dimensions of pull or junction boxes installed in a raceway or cable run shall comply with 314.28(A)(1) through (A)(3). Where an enclosure dimension is to be calculated based on the diameter of entering raceways, the diameter shall be the metric designator (trade size) expressed in the units of measurement employed.

(1) Straight Pulls. In straight pulls, the length of the box or conduit body shall not be less than eight times the metric designator (trade size) of the largest raceway.

For example, a straight pull with trade size 2 conduit would require a 16-inch-long pull box ($8 \times 2 \text{ in.} = 16 \text{ in.}$). Although 16 inches is the required minimum length, a longer pull box may be desired for ease in handling conductors.

The six times rule of 314.28(A)(2) applies to straight-through conduit entries if the conductors are spliced as part of the straight-through wiring. Adjusting the previous example of trade size 2 conduit, if the conductors were spliced within the enclosure, the required pull box dimension could be reduced to a 12-inch-long pull box ($6 \times 2 \text{ in.} = 12 \text{ in.}$)

Section 314.28(A) addresses raceways or cables that contain conductors 4 AWG or larger and are required to be insulated. One conductor that is not required to be insulated is a grounding electrode conductor. So, where a grounding electrode conductor is installed as the sole conductor within a raceway, conduit bodies used as part of that raceway system are not required to comply with enclosure dimensions in 314.28(A).

(2) Angle or U Pulls, or Splices. Where splices or where angle or U pulls are made, the distance between each raceway entry inside the box or conduit body and the opposite wall of the box or conduit body shall not be less than six times the metric designator (trade size) of the largest raceway in a row. This distance shall be increased for additional entries by the amount of the sum of the diameters of all other raceway entries in the same row on the same wall of the box. Each row shall be calculated individually, and the single row that provides the maximum distance shall be used.

Exception: Where a raceway or cable entry is in the wall of a box or conduit body opposite a removable cover, the distance from that wall to the cover shall be permitted to comply with the distance required for one wire per terminal in Table 312.6(A).

The distance between raceway entries enclosing the same conductor shall not be less than six times the metric designator (trade size) of the larger raceway.

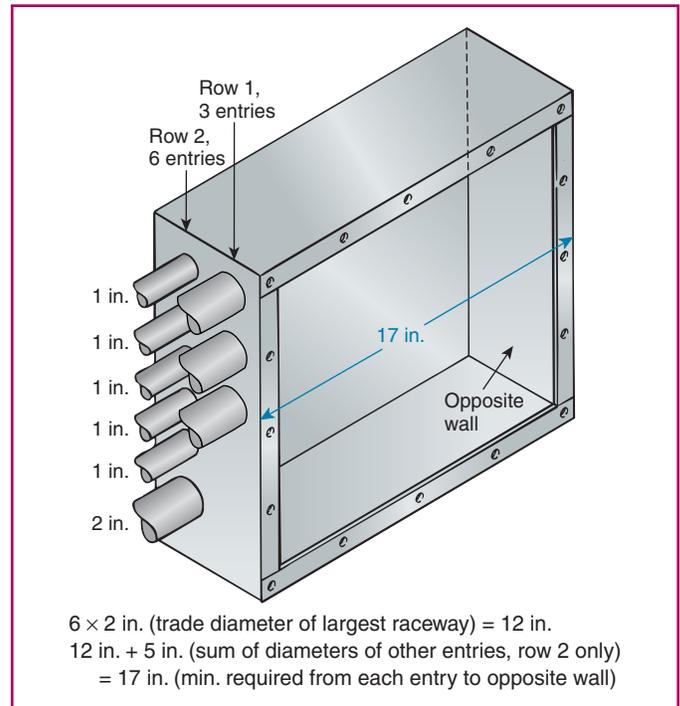

EXHIBIT 314.10 An example showing calculations for splices, angle pulls, or U pulls.

When transposing cable size into raceway size in 314.28(A)(1) and (A)(2), the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

Where splices, angle pulls, or U pulls are made, the distance between each raceway entry inside the box and the opposite wall of the box must not be less than six times the trade diameter of the largest raceway, plus the distance for additional raceway entries (see Exhibit 314.10). This additional distance is calculated by adding the diameters of the other raceway entries in one row on the same side of the box. Raceway entries enclosing the same conductor are required to have a minimum separation between them (see Exhibit 314.11). The intent is to provide adequate space for the conductor to make the bend.

(3) Smaller Dimensions. Listed boxes or listed conduit bodies of dimensions less than those required in 314.28(A)(1) and (A)(2) shall be permitted for installations of combinations of conductors that are less than the maximum conduit or tubing fill (of conduits or tubing being used) permitted by Table 1 of Chapter 9.

Listed conduit bodies of dimensions less than those required in 314.28(A)(2), and having a radius of the curve to the centerline not less than that indicated in Table 2 of Chapter 9 for one-shot and full-shoe benders, shall be permitted for installations of combinations of conductors permitted by Table 1 of Chapter 9. These conduit bodies shall be marked to show they have been specifically evaluated in accordance with this provision.

Where the permitted combinations of conductors for which the box or conduit body has been listed are less than the maximum conduit or tubing fill permitted by Table 1 of Chapter 9,

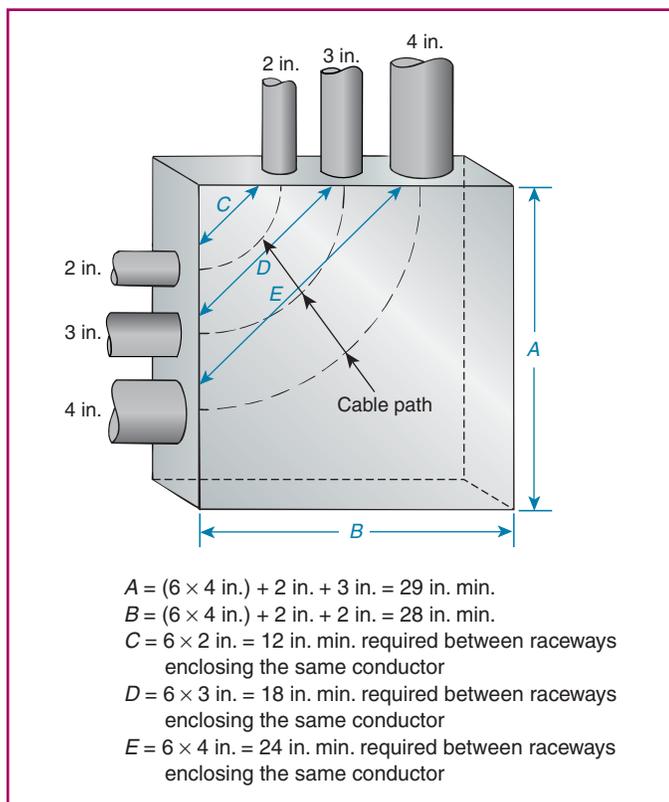

EXHIBIT 314.11 An example showing calculations for raceways enclosing the same conductor.

the box or conduit body shall be permanently marked with the maximum number and maximum size of conductors permitted. For other conductor sizes and combinations, the total cross-sectional area of the fill shall not exceed the cross-sectional area of the conductors specified in the marking, based on the type of conductor identified as part of the product listing.

Informational Note: Unless otherwise specified, the applicable product standards evaluate the fill markings covered here based on conductors with Type XHHW insulation.

(B) Conductors in Pull or Junction Boxes. In pull boxes or junction boxes having any dimension over 1.8 m (6 ft), all conductors shall be cabled or racked up in an approved manner.

(C) Covers. All pull boxes, junction boxes, and conduit bodies shall be provided with covers compatible with the box or conduit body construction and suitable for the conditions of use. Where used, metal covers shall comply with the grounding requirements of 250.110.

(D) Permanent Barriers. Where permanent barriers are installed in a box, each section shall be considered as a separate box.

(E) Power Distribution Blocks. Power distribution blocks shall be permitted in pull and junction boxes over 1650 cm³ (100 in.³) for connections of conductors where installed in boxes and where the installation complies with 314.28(E)(1) through (5).

Exception: Equipment grounding terminal bars shall be permitted in smaller enclosures.

(1) Installation. Power distribution blocks installed in boxes shall be listed. Power distribution blocks installed on the line side of the service equipment shall be listed and marked “suitable for use on the line side of service equipment” or equivalent.

(2) Size. In addition to the overall size requirement in the first sentence of 314.28(A)(2), the power distribution block shall be installed in a box with dimensions not smaller than specified in the installation instructions of the power distribution block.

(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with 312.6.

(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a box, whether or not the box cover is installed.

(5) Through Conductors. Where the pull or junction boxes are used for conductors that do not terminate on the power distribution block(s), the through conductors shall be arranged so the power distribution block terminals are unobstructed following installation.

Similar requirements exist in Article 376 for power distribution blocks in wireways. The use in junction or pull boxes is limited to enclosures over 100 in.³ However, equipment grounding terminal bars are permitted in smaller enclosures.

314.29 Boxes, Conduit Bodies, and Handhole Enclosures to Be Accessible. Boxes, conduit bodies, and handhole enclosures shall be installed so that the wiring contained in them can be rendered accessible without removing any part of the building or structure or, in underground circuits, without excavating sidewalks, paving, earth, or other substance that is to be used to establish the finished grade.

Exception: Listed boxes and handhole enclosures shall be permitted where covered by gravel, light aggregate, or noncohesive granulated soil if their location is effectively identified and accessible for excavation.

A junction box installed on a structural ceiling above a suspended ceiling is permitted, as long as it remains accessible. A suspended ceiling is not considered part of the structure. See Article 100 for the definition of accessible (as applied to wiring methods).

314.30 Handhole Enclosures. Handhole enclosures shall be designed and installed to withstand all loads likely to be imposed on them. They shall be identified for use in underground systems.

Informational Note: See ANSI/SCTE 77-2002, *Specification for Underground Enclosure Integrity*, for additional information on deliberate and nondeliberate traffic loading that can be expected to bear on underground enclosures.

The load referred to in this requirement is the weight or force of traffic loads on handhole enclosures, not electrical loads. See Article 100 for

the definition of the terms *handhole enclosure* and *identified (as applied to equipment)*.

(A) Size. Handhole enclosures shall be sized in accordance with 314.28(A) for conductors operating at 1000 volts or below, and in accordance with 314.71 for conductors operating at over 1000 volts. For handhole enclosures without bottoms where the provisions of 314.28(A)(2), Exception, or 314.71(B)(1), Exception No. 1, apply, the measurement to the removable cover shall be taken from the end of the conduit or cable assembly.

(B) Wiring Entries. Underground raceways and cable assemblies entering a handhole enclosure shall extend into the enclosure, but they shall not be required to be mechanically connected to the enclosure.

(C) Enclosed Wiring. All enclosed conductors and any splices or terminations, if present, shall be listed as suitable for wet locations.

(D) Covers. Handhole enclosure covers shall have an identifying mark or logo that prominently identifies the function of the enclosure, such as “electric.” Handhole enclosure covers shall require the use of tools to open, or they shall weigh over 45 kg (100 lb). Metal covers and other exposed conductive surfaces shall be bonded in accordance with 250.92 if the conductors in the handhole are service conductors, or in accordance with 250.96(A) if the conductors in the handhole are feeder or branch-circuit conductors.

Other exposed conductive surfaces often include metal frames used to secure metal covers in place. No exceptions to the requirement are given for bonding the metal covers and other exposed conductive surfaces.

Part III. Construction Specifications

314.40 Metal Boxes, Conduit Bodies, and Fittings.

(A) Corrosion Resistant. Metal boxes, conduit bodies, and fittings shall be corrosion resistant or shall be well-galvanized, enameled, or otherwise properly coated inside and out to prevent corrosion.

Informational Note: See 300.6 for limitation in the use of boxes and fittings protected from corrosion solely by enamel.

(B) Thickness of Metal. Sheet steel boxes not over 1650 cm³ (100 in.³) in size shall be made from steel not less than 1.59 mm (0.0625 in.) thick. The wall of a malleable iron box or conduit body and a die-cast or permanent-mold cast aluminum, brass, bronze, or zinc box or conduit body shall not be less than 2.38 mm (³/₃₂ in.) thick. Other cast metal boxes or conduit bodies shall have a wall thickness not less than 3.17 mm (¹/₈ in.).

Exception No. 1: Listed boxes and conduit bodies shown to have equivalent strength and characteristics shall be permitted to be made of thinner or other metals.

Exception No. 2: The walls of listed short radius conduit bodies, as covered in 314.16(C)(2), shall be permitted to be made of thinner metal.

(C) Metal Boxes Over 1650 cm³ (100 in.³). Metal boxes over 1650 cm³ (100 in.³) in size shall be constructed so as to be of ample strength and rigidity. If of sheet steel, the metal thickness shall not be less than 1.35 mm (0.053 in.) uncoated.

(D) Grounding Provisions. A means shall be provided in each metal box for the connection of an equipment grounding conductor. The means shall be permitted to be a tapped hole or equivalent.

For device boxes and other standard outlet boxes, the means for connecting the equipment grounding conductor is usually provided by the box manufacturer in the form of a 10-32 tapped hole marked “GR” or “GRD,” or the equivalent, next to the hole. However, the means provided may not necessarily be used.

314.41 Covers. Metal covers shall be of the same material as the box or conduit body with which they are used, or they shall be lined with firmly attached insulating material that is not less than 0.79 mm (¹/₃₂ in.) thick, or they shall be listed for the purpose. Metal covers shall be the same thickness as the boxes or conduit body for which they are used, or they shall be listed for the purpose. Covers of porcelain or other approved insulating materials shall be permitted if of such form and thickness as to afford the required protection and strength.

314.42 Bushings. Covers of outlet boxes and conduit bodies having holes through which flexible cord pendants may pass shall be provided with approved bushings or shall have smooth, well-rounded surfaces on which the cord may bear. Where individual conductors pass through a metal cover, a separate hole equipped with a bushing of suitable insulating material shall be provided for each conductor. Such separate holes shall be connected by a slot as required by 300.20.

314.43 Nonmetallic Boxes. Provisions for supports or other mounting means for nonmetallic boxes shall be outside of the box, or the box shall be constructed so as to prevent contact between the conductors in the box and the supporting screws.

314.44 Marking. All boxes and conduit bodies, covers, extension rings, plaster rings, and the like shall be durably and legibly marked with the manufacturer’s name or trademark.

Part IV. Pull and Junction Boxes, Conduit Bodies, and Handhole Enclosures for Use on Systems over 1000 Volts, Nominal

314.70 General.

(A) Pull and Junction Boxes. Where pull and junction boxes are used on systems over 1000 volts, the installation shall comply with the provisions of Part IV and with the following general provisions of this article:

- (1) Part I, 314.2; 314.3; and 314.4
- (2) Part II, 314.15; 314.17; 314.20; 314.23(A), (B), or (G); 314.28(B); and 314.29
- (3) Part III, 314.40(A) and (C); and 314.41

(B) Conduit Bodies. Where conduit bodies are used on systems over 1000 volts, the installation shall comply with the provisions of Part IV and with the following general provisions of this article:

- (1) Part I, 314.4
- (2) Part II, 314.15; 314.17; 314.23(A), (E), or (G); 314.28(A)(3); and 314.29
- (3) Part III, 314.40(A) and 314.41

(C) Handhole Enclosures. Where handhole enclosures are used on systems over 1000 volts, the installation shall comply with the provisions of Part IV and with the following general provisions of this article:

- (1) Part I, 314.3 and 314.4
- (2) Part II, 314.15; 314.17; 314.23(G); 314.28(B); 314.29; and 314.30

314.71 Size of Pull and Junction Boxes, Conduit Bodies, and Handhole Enclosures. Pull and junction boxes and handhole enclosures shall provide approved space and dimensions for the installation of conductors, and they shall comply with the specific requirements of this section. Conduit bodies shall be permitted if they meet the dimensional requirements for boxes.

(A) For Straight Pulls. The length of the box shall not be less than 48 times the outside diameter, over sheath, of the largest shielded or lead-covered conductor or cable entering the box. The length shall not be less than 32 times the outside diameter of the largest nonshielded conductor or cable.

(B) For Angle or U Pulls.

(1) Distance to Opposite Wall. The distance between each cable or conductor entry inside the box and the opposite wall of the box shall not be less than 36 times the outside diameter, over sheath, of the largest cable or conductor. This distance shall be increased for additional entries by the amount of the sum of the outside diameters, over sheath, of all other cables or conductor entries through the same wall of the box.

Exception No. 1: Where a conductor or cable entry is in the wall of a box opposite a removable cover, the distance from that wall to the cover shall be permitted to be not less than the bending radius for the conductors as provided in 300.34.

Exception No. 2: Where cables are nonshielded and not lead covered, the distance of 36 times the outside diameter shall be permitted to be reduced to 24 times the outside diameter.

(2) Distance Between Entry and Exit. The distance between a cable or conductor entry and its exit from the box shall not be less than 36 times the outside diameter, over sheath, of that cable or conductor.

Exception: Where cables are nonshielded and not lead covered, the distance of 36 times the outside diameter shall be permitted to be reduced to 24 times the outside diameter.

(C) Removable Sides. One or more sides of any pull box shall be removable.

314.72 Construction and Installation Requirements.

(A) Corrosion Protection. Boxes shall be made of material inherently resistant to corrosion or shall be suitably protected, both internally and externally, by enameling, galvanizing, plating, or other means.

(B) Passing Through Partitions. Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors or cables pass through partitions and at other locations where necessary.

(C) Complete Enclosure. Boxes shall provide a complete enclosure for the contained conductors or cables.

(D) Wiring Is Accessible. Boxes and conduit bodies shall be installed so that the conductors are accessible without removing any fixed part of the building or structure. Working space shall be provided in accordance with 110.34.

(E) Suitable Covers. Boxes shall be closed by suitable covers securely fastened in place. Underground box covers that weigh over 45 kg (100 lb) shall be considered meeting this requirement. Covers for boxes shall be permanently marked “DANGER — HIGH VOLTAGE — KEEP OUT.” The marking shall be on the outside of the box cover and shall be readily visible. Letters shall be block type and at least 13 mm (½ in.) in height.

(F) Suitable for Expected Handling. Boxes and their covers shall be capable of withstanding the handling to which they are likely to be subjected.

Part I. General

320.1 Scope. This article covers the use, installation, and construction specifications for armored cable, Type AC.

Type AC cable is listed in sizes 14 AWG through 1 AWG copper and 12 AWG through 1 AWG aluminum or copper-clad aluminum and is rated at 600 volts or less. Exhibit 320.1 shows an example of AC cable.

320.2 Definition.

Armored Cable Type AC. A fabricated assembly of insulated conductors in a flexible interlocked metallic armor. See 320.100.

320.6 Listing Requirements. Type AC cable and associated fittings shall be listed.

EXHIBIT 320.1 An example of Type AC cable. (Courtesy of AFC Cable Systems, Inc.)

Part II. Installation

320.10 Uses Permitted. Type AC cable shall be permitted as follows:

- (1) For feeders and branch circuits in both exposed and concealed installations
- (2) In cable trays
- (3) In dry locations
- (4) Embedded in plaster finish on brick or other masonry, except in damp or wet locations
- (5) To be run or fished in the air voids of masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness

Informational Note: The “Uses Permitted” is not an all-inclusive list.

320.12 Uses Not Permitted. Type AC cable shall not be used as follows:

- (1) Where subject to physical damage
- (2) In damp or wet locations
- (3) In air voids of masonry block or tile walls where such walls are exposed or subject to excessive moisture or dampness
- (4) Where exposed to corrosive conditions
- (5) Embedded in plaster finish on brick or other masonry in damp or wet locations

320.15 Exposed Work. Exposed runs of cable, except as provided in 300.11(A), shall closely follow the surface of the building finish or of running boards. Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not to be subject to physical damage.

320.17 Through or Parallel to Framing Members. Type AC cable shall be protected in accordance with 300.4(A), (C), and (D) where installed through or parallel to framing members.

320.23 In Accessible Attics. Type AC cables in accessible attics or roof spaces shall be installed as specified in 320.23(A) and (B).

(A) Cables Run Across the Top of Floor Joists. Where run across the top of floor joists, or within 2.1 m (7 ft) of the floor or floor joists across the face of rafters or studding, the cable shall be protected by guard strips that are at least as high as the cable. Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 ft) of the nearest edge of the scuttle hole or attic entrance.

(B) Cable Installed Parallel to Framing Members. Where the cable is installed parallel to the sides of rafters, studs, or ceiling or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 300.4(D).

320.24 Bending Radius. Bends in Type AC cable shall be made such that the cable is not damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the Type AC cable.

320.30 Securing and Supporting.

(A) General. Type AC cable shall be supported and secured by staples; cable ties listed and identified for securement and support; straps, hangers, or similar fittings; or other approved means designed and installed so as not to damage the cable.

Simply draping the cable over air ducts or lower members of bar joists, pipes, and ceiling grid members is not permitted.

(B) Securing. Unless otherwise permitted, Type AC cable shall be secured within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting and at intervals not exceeding 1.4 m (4½ ft).

(C) Supporting. Unless otherwise permitted, Type AC cable shall be supported at intervals not exceeding 1.4 m (4½ ft).

Horizontal runs of Type AC cable installed in wooden or metal framing members or similar supporting means shall be considered supported where such support does not exceed 1.4 m (4½ ft) intervals.

Type AC cable run horizontally through framing members is permitted to be passed through bored or punched holes in framing members. Additional securing is not needed, provided the cable is secured within 12 inches of the outlet and the framing members are less than 4½ feet apart. Exhibit 320.2 illustrates the difference between securing and supporting.

(D) Unsupported Cables. Type AC cable shall be permitted to be unsupported and unsecured where the cable complies with any of the following:

- (1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable
- (2) Is not more than 600 mm (2 ft) in length at terminals where flexibility is necessary
- (3) Is not more than 1.8 m (6 ft) in length from the last point of cable support to the point of connection to a luminaire(s) or other electrical equipment and the cable and point of connection are within an accessible ceiling

For the purposes of this section, Type AC cable fittings shall be permitted as a means of cable support.

320.40 Boxes and Fittings. At all points where the armor of AC cable terminates, a fitting shall be provided to protect wires from abrasion, unless the design of the outlet boxes or fittings is such as to afford equivalent protection, and, in addition, an insulating bushing or its equivalent protection shall be provided between the conductors and the armor. The connector or clamp by which the Type AC cable is fastened to boxes or cabinets shall be of such design that the insulating bushing or its equivalent will be visible for inspection. Where change is made from Type AC cable to

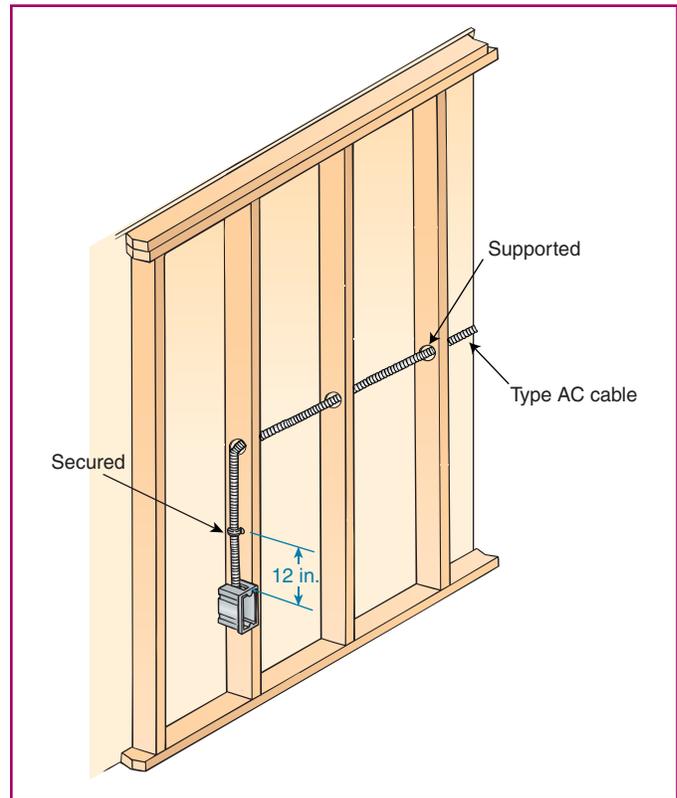

EXHIBIT 320.2 Type AC cable supported by framing members and secured within 12 inches of the outlet box.

other cable or raceway wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in 300.15.

An anti-short bushing (sometimes referred to as a “red head”) is shown in Exhibit 320.3. It is a plastic insert placed between the metal jacket of an AC cable and the insulated conductors at the point where the conductors emerge from the metal jacket of an AC cable. The anti-short bushing provides the insulated conductors with an additional level of short-circuit and ground-fault protection where they are most vulnerable.

EXHIBIT 320.3 An anti-short bushing designed to protect insulated conductors from abrasion. (Courtesy of Eaton, Crouse-Hinds Division)

Armored cable connectors are considered suitable for equipment grounding if installed in accordance with 300.10.

320.80 Ampacity. The ampacity shall be determined in accordance with 310.15.

(A) Thermal Insulation. Armored cable installed in thermal insulation shall have conductors rated at 90°C (194°F). The ampacity of cable installed in these applications shall not exceed that of a 60°C (140°F) rated conductor. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction calculations; however, the ampacity shall not exceed that of a 60°C (140°F) rated conductor.

Armored cable installed in thermal insulation has a decreased heat dissipation capacity. Cable marked “ACTH” indicates an armored cable rated 75°C and employing conductors having thermoplastic insulation. Cable marked “ACTHH” indicates an armored cable rated 90°C and employing conductors having thermoplastic insulation. Cable marked “ACHH” indicates armored cable rated 90°C and employing conductors having thermosetting insulation. Where conductors are rated 90°C, the 90°C ampacity can be used for derating.

(B) Cable Tray. The ampacity of Type AC cable installed in cable tray shall be determined in accordance with 392.80(A).

Part III. Construction Specifications

320.100 Construction. Type AC cable shall have an armor of flexible metal tape and shall have an internal bonding strip of copper or aluminum in intimate contact with the armor for its entire length.

The armor of AC cable is recognized as an equipment grounding conductor by 250.118. This internal bonding strip is not required to be connected to an equipment grounding terminal and can be cut off at the termination of the armored cable or be bent back on the armor. Its purpose is to reduce the inductive reactance of the spiral armor and increase the armor’s effectiveness as an equipment ground. Many installers use this strip to help prevent the insulating (anti-short) bushing required by 320.40 (also known as the “red head”) from falling out during rough wiring.

320.104 Conductors. Insulated conductors shall be of a type listed in Table 310.104(A) or those identified for use in this cable. In addition, the conductors shall have an overall moisture-resistant and fire-retardant fibrous covering. For Type ACT, a moisture-resistant fibrous covering shall be required only on the individual conductors.

320.108 Equipment Grounding Conductor. Type AC cable shall provide an adequate path for fault current as required by 250.4(A)(5) or (B)(4) to act as an equipment grounding conductor.

320.120 Marking. The cable shall be marked in accordance with 310.120, except that Type AC shall have ready identification of the manufacturer by distinctive external markings on the cable armor throughout its entire length.

 - (C) Terminal Block Identification

Part I. General

322.1 Scope. This article covers the use, installation, and construction specifications for flat cable assemblies, Type FC.

Type FC cable is an assembly of three or four parallel 10 AWG special stranded copper wires formed integrally with an insulating material web. The cable is marked with the size of the maximum branch circuit to which it can be connected, the cable type designation, manufacturer’s identification, maximum working voltage, conductor size, and temperature rating. A marking accompanying the cable on a tag or reel indicates the special metal raceways and specific FC cable fittings with which the cable is intended to be used. Exhibits 322.1 and 322.2 show the basic components of this wiring method.

322.2 Definition.

Flat Cable Assembly, Type FC. An assembly of parallel conductors formed integrally with an insulating material web specifically designed for field installation in surface metal raceway.

322.6 Listing Requirements. Type FC and associated fittings shall be listed.

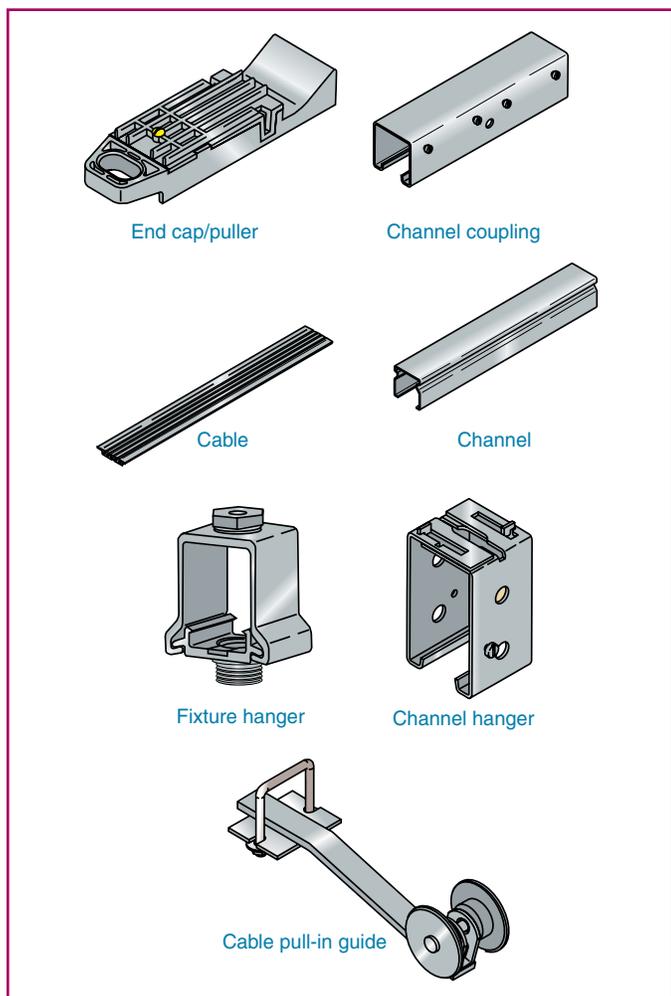

EXHIBIT 322.1 Basic components and accessories used for an installation of Type FC cable assembly. (Courtesy of Legrand/Wiremold®)

EXHIBIT 322.2 A luminaire hanger used with Type FC cable assembly. (Courtesy of Legrand/Wiremold®)

Part II. Installation

322.10 Uses Permitted. Flat cable assemblies shall be permitted only as follows:

- (1) As branch circuits to supply suitable tap devices for lighting, small appliances, or small power loads. The rating of the branch circuit shall not exceed 30 amperes.
- (2) Where installed for exposed work.
- (3) In locations where they will not be subjected to physical damage. Where a flat cable assembly is installed less than 2.5 m (8 ft) above the floor or fixed working platform, it shall be protected by a cover identified for the use.
- (4) In surface metal raceways identified for the use. The channel portion of the surface metal raceway systems shall be installed as complete systems before the flat cable assemblies are pulled into the raceways.

322.12 Uses Not Permitted. Flat cable assemblies shall not be used as follows:

- (1) Where exposed to corrosive conditions, unless suitable for the application
- (2) In hoistways or on elevators or escalators
- (3) In any hazardous (classified) location, except as specifically permitted by other articles in this *Code*
- (4) Outdoors or in wet or damp locations unless identified for the use

322.30 Securing and Supporting. The flat cable assemblies shall be supported by means of their special design features, within the surface metal raceways.

The surface metal raceways shall be supported as required for the specific raceway to be installed.

322.40 Boxes and Fittings.

(A) Dead Ends. Each flat cable assembly dead end shall be terminated in an end-cap device identified for the use.

The dead-end fitting for the enclosing surface metal raceway shall be identified for the use.

(B) Luminaire Hangers. Luminaire hangers installed with the flat cable assemblies shall be identified for the use.

(C) Fittings. Fittings to be installed with flat cable assemblies shall be designed and installed to prevent physical damage to the cable assemblies.

(D) Extensions. All extensions from flat cable assemblies shall be made by approved wiring methods, within the junction boxes, installed at either end of the flat cable assembly runs.

322.56 Splices and Taps.

(A) Splices. Splices shall be made in listed junction boxes.

(B) Taps. Taps shall be made between any phase conductor and the grounded conductor or any other phase conductor by means

of devices and fittings identified for the use. Tap devices shall be rated at not less than 15 amperes, or more than 300 volts to ground, and shall be color-coded in accordance with the requirements of 322.120(C).

Part III. Construction Specifications

322.100 Construction. Flat cable assemblies shall consist of two, three, four, or five conductors.

322.104 Conductors. Flat cable assemblies shall have conductors of 10 AWG special stranded copper wires.

322.112 Insulation. The entire flat cable assembly shall be formed to provide a suitable insulation covering all the conductors and using one of the materials recognized in Table 310.104(A) for general branch-circuit wiring.

322.120 Marking.

(A) Temperature Rating. In addition to the provisions of 310.120, Type FC cable shall have the temperature rating durably marked on the surface at intervals not exceeding 600 mm (24 in.).

(B) Identification of Grounded Conductor. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white or gray marking.

Informational Note: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

(C) Terminal Block Identification. Terminal blocks identified for the use shall have distinctive and durable markings for color or word coding. The grounded conductor section shall have a white marking or other suitable designation. The next adjacent section of the terminal block shall have a black marking or other suitable designation. The next section shall have a red marking or other suitable designation. The final or outer section, opposite the grounded conductor section of the terminal block, shall have a blue marking or other suitable designation.

Part I. General

324.1 Scope. This article covers a field-installed wiring system for branch circuits incorporating Type FCC cable and associated accessories as defined by the article. The wiring system is designed for installation under carpet squares.

The FCC system is designed to provide a completely accessible, flexible power system. As shown in Exhibit 324.1, it also provides an easy method for reworking obsolete wiring systems currently in use in many office facilities. The carpet squares are not permitted to be larger than 1.0 meter by 1.0 meter to comply with 324.41. This limitation provides ready access to the cable by lifting a carpet square. It also reduces the likelihood of an individual cutting through the carpet above the cable with a knife or razor blade and possibly penetrating the top shield of the cable.

324.2 Definitions.

Bottom Shield. A protective layer that is installed between the floor and Type FCC flat conductor cable to protect the cable from physical damage and may or may not be incorporated as an integral part of the cable.

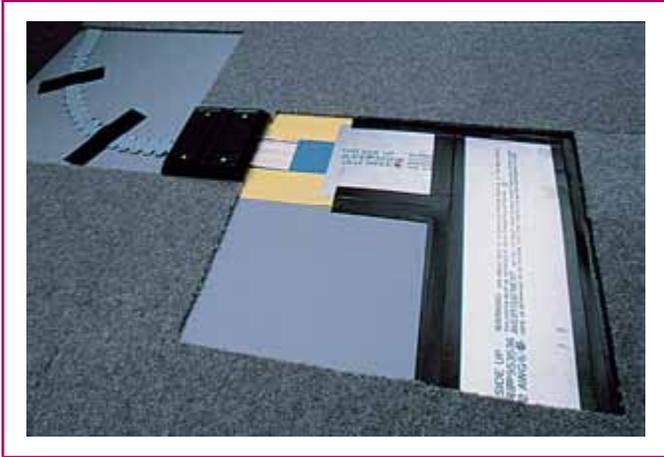

EXHIBIT 324.1 Type FCC cable installed beneath carpet squares.
(Courtesy of Tyco Electronics)

Cable Connector. A connector designed to join Type FCC cables without using a junction box.

FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares.

Informational Note: The FCC system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.

Insulating End. An insulator designed to electrically insulate the end of a Type FCC cable.

Metal Shield Connections. Means of connection designed to electrically and mechanically connect a metal shield to another metal shield, to a receptacle housing or self-contained device, or to a transition assembly.

Top Shield. A grounded metal shield covering under-carpet components of the FCC system for the purposes of providing protection against physical damage.

Transition Assembly. An assembly to facilitate connection of the FCC system to other wiring systems, incorporating (1) a means of electrical interconnection and (2) a suitable box or covering for providing electrical safety and protection against physical damage.

Type FCC Cable. Three or more flat copper conductors placed edge-to-edge and separated and enclosed within an insulating assembly.

324.6 Listing Requirements.

Type FCC cable and associated fittings shall be listed.

Listing is based on compliance with requirements in recognized product standards. Non-listed cables and associated fittings may not have been evaluated for compliance with such requirements. Acceptance in the field is often based on such compliance.

Part II. Installation

324.10 Uses Permitted.

(A) Branch Circuits. Use of FCC systems shall be permitted both for general-purpose and appliance branch circuits and for individual branch circuits.

(B) Branch-Circuit Ratings.

(1) Voltage. Voltage between ungrounded conductors shall not exceed 300 volts. Voltage between ungrounded conductors and the grounded conductor shall not exceed 150 volts.

(2) Current. General-purpose and appliance branch circuits shall have ratings not exceeding 20 amperes. Individual branch circuits shall have ratings not exceeding 30 amperes.

(C) Floors. Use of FCC systems shall be permitted on hard, sound, smooth, continuous floor surfaces made of concrete, ceramic, or composition flooring, wood, and similar materials.

(D) Walls. Use of FCC systems shall be permitted on wall surfaces in surface metal raceways.

(E) Damp Locations. Use of FCC systems in damp locations shall be permitted.

(F) Heated Floors. Materials used for floors heated in excess of 30°C (86°F) shall be identified as suitable for use at these temperatures.

(G) System Height. Any portion of an FCC system with a height above floor level exceeding 2.3 mm (0.090 in.) shall be tapered or feathered at the edges to floor level.

324.12 Uses Not Permitted. FCC systems shall not be used in the following locations:

- (1) Outdoors or in wet locations
- (2) Where subject to corrosive vapors
- (3) In any hazardous (classified) location
- (4) In residential buildings
- (5) In school and hospital buildings, other than administrative office areas

Type FCC wiring systems are not permitted throughout school and hospital buildings except in parts of these buildings that are administrative office spaces.

324.18 Crossings. Crossings of more than two Type FCC cable runs shall not be permitted at any one point. Crossings of a Type FCC cable over or under a flat communications or signal cable shall be permitted. In each case, a grounded layer of metal shielding shall separate the two cables, and crossings of more than two flat cables shall not be permitted at any one point.

324.30 Securing and Supporting. All FCC system components shall be firmly anchored to the floor or wall using an adhesive or mechanical anchoring system identified for this use. Floors

shall be prepared to ensure adherence of the FCC system to the floor until the carpet squares are placed.

324.40 Boxes and Fittings.

(A) Cable Connections and Insulating Ends. All Type FCC cable connections shall use connectors identified for their use, installed such that electrical continuity, insulation, and sealing against dampness and liquid spillage are provided. All bare cable ends shall be insulated and sealed against dampness and liquid spillage using listed insulating ends.

(B) Polarization of Connections. All receptacles and connections shall be constructed and installed so as to maintain proper polarization of the system.

(C) Shields.

(1) Top Shield. A metal top shield shall be installed over all floor-mounted Type FCC cable, connectors, and insulating ends. The top shield shall completely cover all cable runs, corners, connectors, and ends.

(2) Bottom Shield. A bottom shield shall be installed beneath all Type FCC cable, connectors, and insulating ends.

(D) Connection to Other Systems. Power feed, grounding connection, and shield system connection between the FCC system and other wiring systems shall be accomplished in a transition assembly identified for this use.

(E) Metal-Shield Connectors. Metal shields shall be connected to each other and to boxes, receptacle housings, self-contained devices, and transition assemblies using metal-shield connectors.

324.41 Floor Coverings. Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 1.0 m (39.37 in.) square. Carpet squares that are adhered to the floor shall be attached with release-type adhesives.

324.42 Devices.

(A) Receptacles. All receptacles, receptacle housings, and self-contained devices used with the FCC system shall be identified for this use and shall be connected to the Type FCC cable and metal shields. Connection from any grounding conductor of the Type FCC cable shall be made to the shield system at each receptacle.

(B) Receptacles and Housings. Receptacle housings and self-contained devices designed either for floor mounting or for in-wall or on-wall mounting shall be permitted for use with the FCC system. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of Type FCC cable and for electrically connecting the housing or device with the metal shield. Receptacles and self-contained devices shall comply with 406.4. Power and communications

outlets installed together in common housing shall be permitted in accordance with 800.133(A)(1)(d), Exception No. 2.

324.56 Splices and Taps.

(A) FCC Systems Alterations. Alterations to FCC systems shall be permitted. New cable connectors shall be used at new connection points to make alterations. It shall be permitted to leave unused cable runs and associated cable connectors in place and energized. All cable ends shall be covered with insulating ends.

(B) Transition Assemblies. All transition assemblies shall be identified for their use. Each assembly shall incorporate means for facilitating entry of the Type FCC cable into the assembly, for connecting the Type FCC cable to grounded conductors, and for electrically connecting the assembly to the metal cable shields and to equipment grounding conductors.

324.60 Grounding. All metal shields, boxes, receptacle housings, and self-contained devices shall be electrically continuous to the equipment grounding conductor of the supplying branch circuit. All such electrical connections shall be made with connectors identified for this use. The electrical resistivity of such shield system shall not be more than that of one conductor of the Type FCC cable used in the installation.

Part III. Construction Specifications

324.100 Construction.

(A) Type FCC Cable Type FCC cable shall be listed for use with the FCC system and shall consist of three, four, or five flat copper conductors, one of which shall be an equipment grounding conductor.

(B) Shields.

(1) Materials and Dimensions. All top and bottom shields shall be of designs and materials identified for their use. Top shields shall be metal. Both metallic and nonmetallic materials shall be permitted for bottom shields.

(2) Resistivity. Metal shields shall have cross-sectional areas that provide for electrical resistivity of not more than that of one conductor of the Type FCC cable used in the installation.

324.101 Corrosion Resistance. Metal components of the system shall be either corrosion resistant, coated with corrosion-resistant materials, or insulated from contact with corrosive substances.

324.112 Insulation.

The insulating material of the cable shall be moisture resistant and flame retardant. All insulating materials in the FCC systems shall be identified for their use.

324.120 Markings.

(A) Cable Marking. Type FCC cable shall be clearly and durably marked on both sides at intervals of not more than 610 mm (24 in.) with the information required by 310.120(A) and with the following additional information:

- (1) Material of conductors
- (2) Maximum temperature rating
- (3) Ampacity

(B) Conductor Identification. Conductors shall be clearly and durably identified on both sides throughout their length as specified in 310.110.

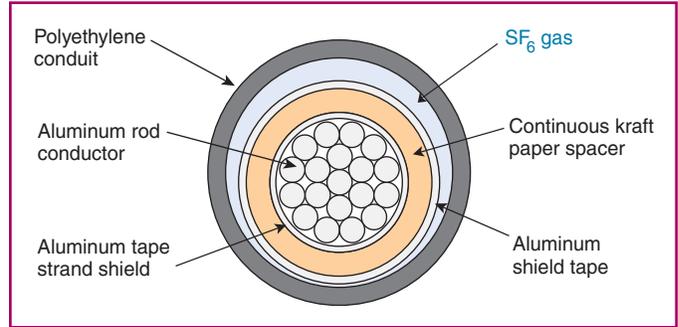

EXHIBIT 326.1 Cross section of single-conductor, 4750-kcmil Type IGS cable.

Part I. General

326.1 Scope. This article covers the use, installation, and construction specifications for integrated gas spacer cable, Type IGS.

As illustrated in Exhibit 326.1, IGS cable consists of solid aluminum rod conductors, 250 kcmil minimum size. These conductors are insulated with dry kraft paper and are installed in a medium-density polyethylene gas pipe, minimum trade size 2, which is then filled with sulfur hexafluoride (SF₆) gas at a pressure of approximately 20 pounds per square inch.

326.2 Definition.

Integrated Gas Spacer Cable, Type IGS. A factory assembly of one or more conductors, each individually insulated and enclosed in a loose fit, nonmetallic flexible conduit as an integrated gas spacer cable rated 0 through 600 volts.

Part II. Installation

326.10 Uses Permitted. Type IGS cable shall be permitted for use underground, including direct burial in the earth, as the following:

- (1) Service-entrance conductors
- (2) Feeder or branch-circuit conductors
- (3) Service conductors, underground

326.12 Uses Not Permitted. Type IGS cable shall not be used as interior wiring or be exposed in contact with buildings.

326.24 Bending Radius. Where the coilable nonmetallic conduit and cable are bent for installation purposes or are flexed or bent during shipment or installation, the radius of the curve of the inner edge measured to the inside of the bend shall not be less than specified in Table 326.24.

326.26 Bends. A run of Type IGS cable between pull boxes or terminations shall not contain more than the equivalent of four quarter bends (360 degrees total), including those bends located immediately at the pull box or terminations.

326.40 Fittings. Terminations and splices for Type IGS cable shall be identified as a type that is suitable for maintaining the gas pressure within the conduit. A valve and cap shall be provided for each length of the cable and conduit to check the gas pressure or to inject gas into the conduit.

326.80 Ampacity. The ampacity of Type IGS cable shall not exceed the values shown in Table 326.80.

1750	315	4250	491
2000	336	4500	505
2250	357	4750	519

Part III. Construction Specifications

326.104 Conductors. The conductors shall be solid aluminum rods, laid parallel, consisting of one to nineteen 12.7 mm (½ in.) diameter rods. The minimum conductor size shall be 250 kcmil, and the maximum size shall be 4750 kcmil.

326.112 Insulation. The insulation shall be dry kraft paper tapes and a pressurized sulfur hexafluoride gas (SF₆), both approved for electrical use. The nominal gas pressure shall be 138 kPa gauge (20 lb/in.² gauge). The thickness of the paper spacer shall be as specified in [Table 326.112](#).

326.116 Conduit. The conduit shall be a medium density polyethylene identified as suitable for use with natural gas rated pipe in metric designator 53, 78 or 103 (trade size 2, 3, or 4). The percent fill dimensions for the conduit are shown in [Table 326.116](#).

TABLE 326.112 Paper Spacer Thickness

Size (kcmil)	Thickness	
	mm	in.
250–1000	1.02	0.040
1250–4750	1.52	0.060

Part I. General

328.1 Scope. This article covers the use, installation, and construction specifications for medium voltage cable, Type MV.

Type MV cables are rated 2001 to 35,000 volts. If MV cables are installed in underground installations, they must comply with [300.50](#).

See also

[310.10\(E\)](#) and [310.10\(F\)](#) for shielding requirements

328.2 Definition.

Medium Voltage Cable, Type MV. A single or multiconductor solid dielectric insulated cable rated 2001 volts or higher.

328.6 Listing Requirements. Type MV cables and associated fittings shall be listed.

Part II. Installation

328.10 Uses Permitted. Type MV cable shall be permitted for use on power systems rated up to and including 35,000 volts, nominal, as follows:

- (1) In wet or dry locations.
- (2) In raceways.

- (3) In cable trays, where identified for the use, in accordance with 392.10, 392.20(B), (C), and (D), 392.22(C), 392.30(B)(1), 392.46, 392.56, and 392.60. Type MV cable that has an overall metallic sheath or armor, complies with the requirements for Type MC cable, and is identified as “MV or MC” shall be permitted to be installed in cable trays in accordance with 392.10(B)(2).
- (4) Direct buried in accordance with 300.50.
- (5) In messenger-supported wiring in accordance with Part II of Article 396.
- (6) As exposed runs in accordance with 300.37. Type MV cable that has an overall metallic sheath or armor, complies with the requirements for Type MC cable, and is identified as “MV or MC” shall be permitted to be installed as exposed runs of metal-clad cable in accordance with 300.37.

Informational Note: The “Uses Permitted” is not an all-inclusive list.

Type MV cables intended for installation in cable trays in accordance with Article 392 are marked “For CT Use” or “For Use in Cable Trays.” Where marked “MV or MC,” the cable complies with the crush and impact rating associated with MC cable. Cable marked “MV or MC” is permitted to be installed in accordance with Article 330 as well as Article 392.

328.12 Uses Not Permitted. Type MV cable shall not be used where exposed to direct sunlight, unless identified for the use.

328.14 Installation. Type MV cable shall be installed, terminated, and tested by qualified persons.

Informational Note: Information about accepted industry practices and installation procedures for medium-voltage cable are described in ANSI/NECA/NCSCB 600-2014, *Standard for Installing and Maintaining Medium-Voltage Cable* and in IEEE 576-2000, *Recommended Practice for Installation, Termination, and Testing of Insulated Power Cables as Used in Industrial and Commercial Applications*.

N 328.30 Support. Type MV cable terminated in equipment or installed in pull boxes or vaults shall be secured and supported by metallic or nonmetallic supports suitable to withstand the weight by cable ties listed, labeled, and identified for securement and support, or other approved means, at intervals not exceeding 1.5 m (5 ft) from terminations or a maximum of 1.8 m (6 ft) between supports.

328.80 Ampacity. The ampacity of Type MV cable shall be determined in accordance with 310.60. The ampacity of Type MV cable installed in cable tray shall be determined in accordance with 392.80(B).

Part III. Construction Specifications

328.100 Construction. Type MV cables shall have copper, aluminum, or copper-clad aluminum conductors and shall comply with Table 310.104(C) and Table 310.104(D) or Table 310.104(E).

328.120 Marking. Medium voltage cable shall be marked as required by 310.120.

In addition to the marking requirements of 310.120, insulation-level marking requirements include 100 percent, 133 percent, and 173 percent. These insulation levels are explained in the notes to Table 310.104(E). Shielded cable is marked “MV-90” and “MV-105” and is suitable for use in both dry and wet locations at both 90°C and 105°C. Additionally, the UL *Guide Information for Electrical Equipment — The White Book*, in category PITY, gives examples of required and optional marking.

Part I. General

330.1 Scope. This article covers the use, installation, and construction specifications of metal-clad cable, Type MC.

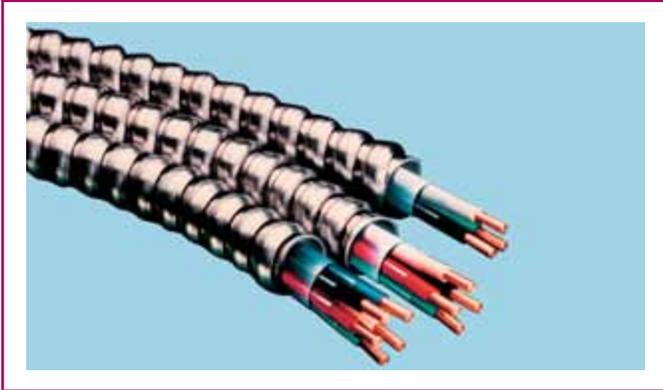

EXHIBIT 330.1 Examples of Type MC cable. (Courtesy of AFC Cable Systems, Inc.)

Type MC cable is rated up to 2000 volts in sizes 18 AWG and larger for copper or nickel-coated copper and 12 AWG and larger for aluminum or copper-clad aluminum. Type MC cable rated 2400 to 35,000 volts is classified as medium-voltage cable, is marked “Type MV or MC,” and is covered by Article 328. Type MC-HL cable rated up to 35,000 volts is suitable for hazardous locations and is provided with a gas/vaportight continuous sheath. Composite electrical MC and optical fiber cables are classified as Type MC cable and are marked “MC-OF.”

Type MC cable is available in three designs: interlocked metal tape, corrugated metal tube, and smooth metal tube. A nonmetallic jacket may be provided over the metal sheath. Cable construction must comply with 250.118(10) in order for the cable to be used as an equipment grounding conductor. It must be marked with the maximum rated voltage, the proper insulation-type letter or letters, and the AWG size or circular mil area.

Exhibit 330.1 shows some examples of MC cable. The basic standard to investigate cable in this category is ANSI/UL 1569, *Standard for Metal-Clad Cables*. Summary information regarding listed metal-clad cable may be found in the *UL Guide Information for Electrical Equipment — The White Book*, under category PJAZ.

Exhibit 770.2 for an example of Type MC cable

330.2 Definition.

Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath.

N 330.6 Listing Requirements. Type MC cable shall be listed. Fittings used for connecting Type MC cable to boxes, cabinets, or other equipment shall be listed and identified for such use.

The sheath of Type MC cable is constructed of aluminum, copper, or steel and can also have a supplemental protective PVC jacket. Connectors should be selected in accordance with the size and type of cable for which they are designated. Bronze connectors are intended for use only with cable employing corrugated copper armor. Fittings with

direct-bearing screws are suitable for steel armor only. Type AC cable connectors are also acceptable and listed for use with MC cable when specifically indicated on the fitting or the shipping carton.

Part II. Installation

330.10 Uses Permitted.

(A) General Uses.

Type MC cable shall be permitted as follows:

- (1) For services, feeders, and branch circuits.
- (2) For power, lighting, control, and signal circuits.
- (3) Indoors or outdoors.
- (4) Exposed or concealed.
- (5) To be direct buried where identified for such use.
- (6) In cable tray where identified for such use.
- (7) In any raceway.
- (8) As aerial cable on a messenger.
- (9) In hazardous (classified) locations where specifically permitted by other articles in this *Code*.
- (10) In dry locations and embedded in plaster finish on brick or other masonry except in damp or wet locations.
- (11) In wet locations where a corrosion-resistant jacket is provided over the metallic covering and any of the following conditions are met:
 - a. The metallic covering is impervious to moisture.
 - b. A jacket resistant to moisture is provided under the metal covering.
 - c. The insulated conductors under the metallic covering are listed for use in wet locations.
- (12) Where single-conductor cables are used, all phase conductors and, where used, the grounded conductor shall be grouped together to minimize induced voltage on the sheath.

Close circuit conductor spacing is necessary to minimize induced voltage on the sheath and to minimize overall circuit impedance.

(B) Specific Uses. Type MC cable shall be permitted to be installed in compliance with **Parts II and III** of Article 725 and 770.133 as applicable and in accordance with 330.10(B)(1) through (B)(4).

Informational Note: The “Uses Permitted” is not an all-inclusive list.

- (1) **Cable Tray.** Type MC cable installed in cable tray shall comply with 392.10, 392.12, 392.18, 392.20, 392.22, 392.30, 392.46, 392.56, 392.60(C), and 392.80.
- (2) **Direct Buried.** Direct-buried cable shall comply with 300.5 or 300.50, as appropriate.
- (3) **Installed as Service-Entrance Cable.** Type MC cable installed as service-entrance cable shall be permitted in accordance with 230.43.
- (4) **Installed Outside of Buildings or Structures or as Aerial Cable.** Type MC cable installed outside of buildings or structures or as aerial cable shall comply with 225.10, 396.10, and 396.12.

330.12 Uses Not Permitted. Type MC cable shall not be used under either of the following conditions:

- (1) Where subject to physical damage
- (2) Where exposed to any of the destructive corrosive conditions in (a) or (b), unless the metallic sheath or armor is resistant to the conditions or is protected by material resistant to the conditions:
 - a. Direct buried in the earth or embedded in concrete unless identified for direct burial
 - b. Exposed to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids

330.15 Exposed Work. Exposed runs of cable, except as provided in 300.11(A), shall closely follow the surface of the building finish or of running boards. Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not to be subject to physical damage.

330.17 Through or Parallel to Framing Members. Type MC cable shall be protected in accordance with 300.4(A), (C), and (D) where installed through or parallel to framing members.

330.23 In Accessible Attics. The installation of Type MC cable in accessible attics or roof spaces shall also comply with 320.23.

In accessible attics, cable installed across the top of floor joists or within 7 feet of the floor or floor joists across the face of rafters or studs must be protected by guard strips. Where the attic is not accessible by a permanent ladder or stairs, guard strips are required only within 6 feet of the scuttle hole or opening.

330.24 Bending Radius. Bends in Type MC cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than required in 330.24(A) through (C).

(A) Smooth Sheath.

- (1) Ten times the external diameter of the metallic sheath for cable not more than 19 mm ($\frac{3}{4}$ in.) in external diameter
- (2) Twelve times the external diameter of the metallic sheath for cable more than 19 mm ($\frac{3}{4}$ in.) but not more than 38 mm ($1\frac{1}{2}$ in.) in external diameter
- (3) Fifteen times the external diameter of the metallic sheath for cable more than 38 mm ($1\frac{1}{2}$ in.) in external diameter

(B) Interlocked-Type Armor or Corrugated Sheath. Seven times the external diameter of the metallic sheath.

(C) Shielded Conductors. Twelve times the overall diameter of one of the individual conductors or seven times the overall diameter of the multiconductor cable, whichever is greater.

330.30 Securing and Supporting.

(A) General. Type MC cable shall be supported and secured by staples; cable ties listed and identified for securement and

support; straps, hangers, or similar fittings; or other approved means designed and installed so as not to damage the cable.

A difference exists between securing and supporting. Cable that runs horizontally through or on framing members or racks (spaced less than 6 feet apart) without additional securing is considered supported. Staples or cable ties are not required as the cable passes through or on these members. However, the cable must be secured (fastened in place) within 12 inches of the outlet box. Staples, cable ties, or clamps would be necessary to secure a cable. Both requirements are illustrated in Exhibit 330.2.

(B) Securing. Unless otherwise provided, cables shall be secured at intervals not exceeding 1.8 m (6 ft). Cables containing four or fewer conductors sized no larger than 10 AWG shall be secured within 300 mm (12 in.) of every box, cabinet, fitting, or other cable termination. In vertical installations, listed cables with ungrounded conductors 250 kcmil and larger shall be permitted to be secured at intervals not exceeding 3 m (10 ft).

(C) Supporting. Unless otherwise provided, cables shall be supported at intervals not exceeding 1.8 m (6 ft).

Horizontal runs of Type MC cable installed in wooden or metal framing members or similar supporting means shall be considered supported and secured where such support does not exceed 1.8-m (6-ft) intervals.

(D) Unsupported Cables. Type MC cable shall be permitted to be unsupported and unsecured where the cable complies with any of the following:

- (1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical.
- (2) Is not more than 1.8 m (6 ft) in length from the last point of cable support to the point of connection to luminaires or other electrical equipment and the cable and point of connection are within an accessible ceiling.
- (3) Is Type MC of the interlocked armor type in lengths not exceeding 900 mm (3 ft) from the last point where it is securely fastened and is used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation.

For the purpose of this section, Type MC cable fittings shall be permitted as a means of cable support.

330.31 Single Conductors. Where single-conductor cables with a nonferrous armor or sheath are used, the installation shall comply with 300.20.

330.80 Ampacity. The ampacity of Type MC cable shall be determined in accordance with 310.15 or 310.60 for 14 AWG and larger conductors and in accordance with Table 402.5 for 18 AWG and 16 AWG conductors. The installation shall not exceed the temperature ratings of terminations and equipment.

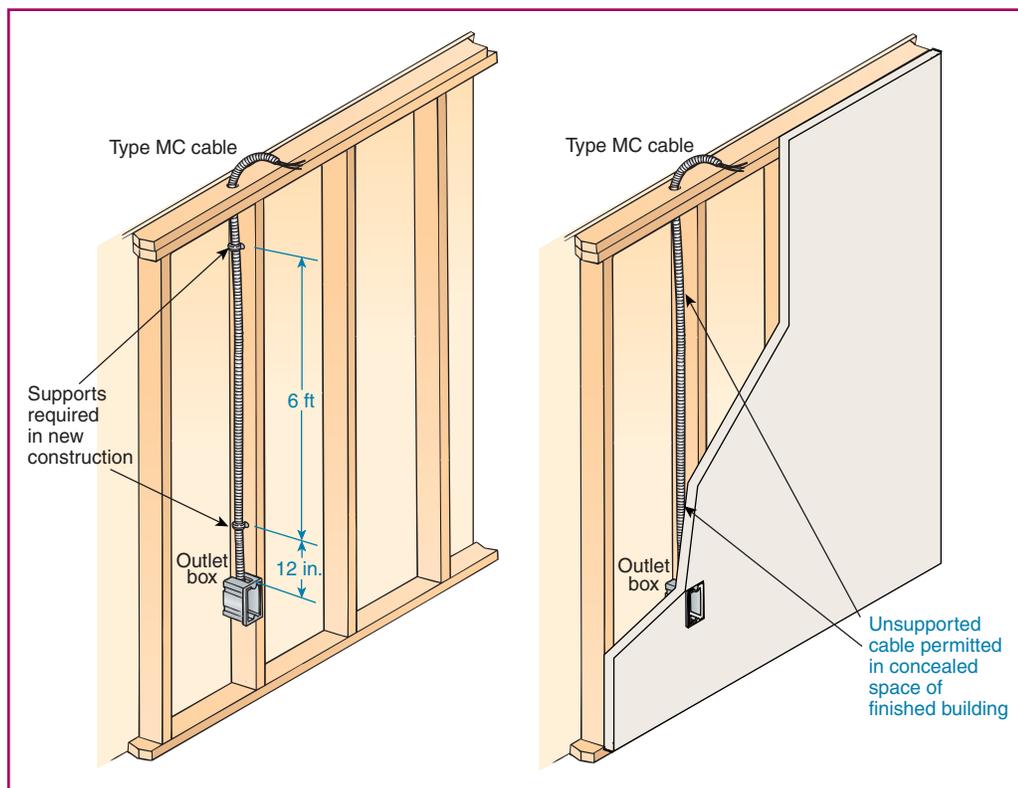

EXHIBIT 330.2 Type MC cable supported and secured at intervals not exceeding 6 feet and within 12 inches of the box [per 330.30(B)] and Type MC cable to be fished in walls, floors, or ceilings [per 330.30(D)(1)].

(A) Type MC Cable Installed in Cable Tray. The ampacities for Type MC cable installed in cable tray shall be determined in accordance with 392.80.

(B) Single Type MC Conductors Grouped Together. Where single Type MC conductors are grouped together in a triangular or square configuration and installed on a messenger or exposed with a maintained free airspace of not less than 2.15 times one conductor diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities in the following tables:

- (1) Table 310.15(B)(20) for conductors rated 0 through 2000 volts
- (2) Table 310.60(C)(67) and Table 310.60(C)(68) for conductors rated over 2000 volts

Part III. Construction Specifications

330.104 Conductors. Conductors shall be of copper, aluminum, copper-clad aluminum, nickel or nickel-coated copper, solid or stranded. The minimum conductor size shall be 18 AWG copper, nickel or nickel-coated copper, or 12 AWG aluminum or copper-clad aluminum.

Nickel and nickel-coated copper are used as conductors in some fire-rated MC cables. Nickel and nickel-coated copper conductors are

permitted by 310.106(B) and are listed in Table 310.104(A) for insulation types PFAH and TFE (and used in high temperature applications).

330.108 Equipment Grounding Conductor. Where Type MC cable is used to provide an equipment grounding conductor, it shall comply with 250.118(10) and 250.122.

The interlocked sheath cable construction is not recognized as an EGC. An uninsulated grounding/bonding conductor must be integral to this type of MC cable to qualify the sheath as an EGC.

330.112 Insulation. Insulated conductors shall comply with 330.112(A) or (B).

(A) 1000 Volts or Less. Insulated conductors in sizes 18 AWG and 16 AWG shall be of a type listed in Table 402.3, with a maximum operating temperature not less than 90°C (194°F) and as permitted by 725.49. Conductors larger than 16 AWG shall be of a type listed in Table 310.104(A) or of a type identified for use in Type MC cable.

(B) Over 1000 Volts. Insulated conductors shall be of a type listed in Table 310.104(B) and Table 310.104(C).

330.116 Sheath. Metallic covering shall be one of the following types: smooth metallic sheath, corrugated metallic sheath, or interlocking metal tape armor. The metallic sheath shall be continuous and close fitting. A nonmagnetic sheath or armor shall

be used on single conductor Type MC. Supplemental protection of an outer covering of corrosion-resistant material shall be permitted and shall be required where such protection is needed. The sheath shall not be used as a current-carrying conductor.

Informational Note: See 300.6 for protection against corrosion.

- 332.116 Sheath

Part I. General

332.1 Scope. This article covers the use, installation, and construction specifications for mineral-insulated, metal-sheathed cable, Type MI.

Type MI cable consists of one or more solid conductors insulated with highly compressed magnesium oxide and enclosed in a continuous copper or alloy steel (e.g., stainless steel) sheath with or without a nonmetallic jacket. It is manufactured in size 16 AWG to 500 kcmil, single conductor; 16 AWG to 4 AWG, 2 and 3 conductor; 16 AWG to 6 AWG, four conductor; and 16 AWG to 10 AWG, 7 conductor. The cable is rated 600 volts. Two,

three, four, and seven conductor Type MI cable rated 300 volts is available in 18 to 16 AWG for signaling circuits.

332.2 Definition.

Mineral-Insulated, Metal-Sheathed Cable, Type MI. A factory assembly of one or more conductors insulated with a highly compressed refractory mineral insulation and enclosed in a liquidtight and gastight continuous copper or alloy steel sheath.

332.6 Listing Requirements. Type MI cable and associated fittings shall be listed.

Part II. Installation

332.10 Uses Permitted. Type MI cable shall be permitted as follows:

- (1) For services, feeders, and branch circuits
- (2) For power, lighting, control, and signal circuits
- (3) In dry, wet, or continuously moist locations
- (4) Indoors or outdoors
- (5) Where exposed or concealed
- (6) Where embedded in plaster, concrete, fill, or other masonry, whether above or below grade
- (7) In hazardous (classified) locations where specifically permitted by other articles in this *Code*
- (8) Where exposed to oil and gasoline
- (9) Where exposed to corrosive conditions not deteriorating to its sheath
- (10) In underground runs where suitably protected against physical damage and corrosive conditions
- (11) In or attached to cable tray

Informational Note: The “Uses Permitted” is not an all-inclusive list.

332.12 Uses Not Permitted. Type MI cable shall not be used under the following conditions or in the following locations:

- (1) In underground runs unless protected from physical damage, where necessary
- (2) Where exposed to conditions that are destructive and corrosive to the metallic sheath, unless additional protection is provided

332.17 Through or Parallel to Framing Members. Type MI cable shall be protected in accordance with 300.4 where installed through or parallel to framing members.

332.24 Bending Radius. Bends in Type MI cable shall be so made that the cable will not be damaged. The radius of the inner edge of any bend shall not be less than required as follows:

- (1) Five times the external diameter of the metallic sheath for cable not more than 19 mm ($\frac{3}{4}$ in.) in external diameter

- (2) Ten times the external diameter of the metallic sheath for cable greater than 19 mm (¾ in.) but not more than 25 mm (1 in.) in external diameter

The minimum bending radius is to prevent mechanical damage to the conductor insulation or the sheath that could result in cracking, a hot spot at the point of damage, or both. Exhibit 332.1 illustrates the minimum bending radius for Type MI cables based upon the external or outside diameter (OD).

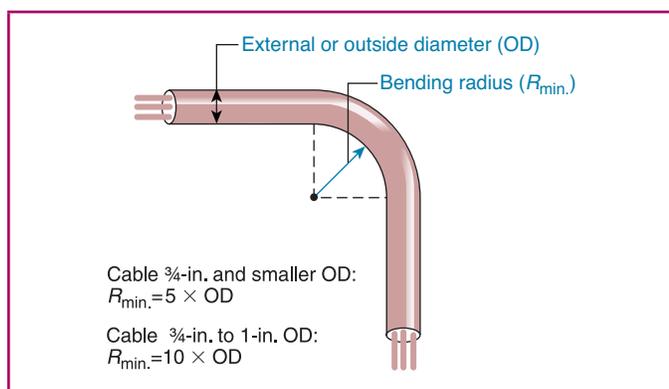

EXHIBIT 332.1 An illustration of the bending radius in Type MI cable.

332.30 Securing and Supporting. Type MI cable shall be supported and secured by staples, straps, hangers, or similar fittings, designed and installed so as not to damage the cable, at intervals not exceeding 1.8 m (6 ft).

Type MI cable used as part of a fire-rated assembly will typically require more support than for non-fire-rated installations. The manufacturer's instructions will specify the support intervals to achieve the desired fire rating.

See also

300.19(B) and its commentary for support requirements of fire-rated cable assemblies

(A) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with **300.4** shall

be considered supported and secured where such support does not exceed 1.8 m (6 ft) intervals.

(B) Unsupported Cable. Type MI cable shall be permitted to be unsupported where the cable is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable.

(C) Cable Trays. All MI cable installed in cable trays shall comply with **392.30(A)**.

332.31 Single Conductors. Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath.

Because single conductors in a metal sheath can induce voltage on the sheath, all conductors of the circuit must be grouped together to minimize the voltage on the sheath.

Where single conductors enter a ferrous enclosure, inductive heating can occur due to hysteresis loss caused by the magnetic flux occurring in ferrous metals and I^2R losses from the currents induced by the conductor. To minimize this magnetic heating of enclosures, **300.20** requires additional measures, including cutting slots in the metal between the individual holes for each conductor connector. Cable manufacturers offer nonferrous connecting plates that accept individual threaded connections of all circuit conductors, thereby eliminating circulating currents and fully complying with **300.20**.

332.40 Boxes and Fittings.

(A) Fittings. Fittings used for connecting Type MI cable to boxes, cabinets, or other equipment shall be identified for such use.

Fittings are required by **332.6** to be listed for use with Type MI cable. Fittings are suitable for use at a maximum operating temperature of 90°C in dry locations and 60°C in wet locations. As shown in Exhibit 332.2, a complete box connector consists of a connector body and a screw-on potting fitting. The

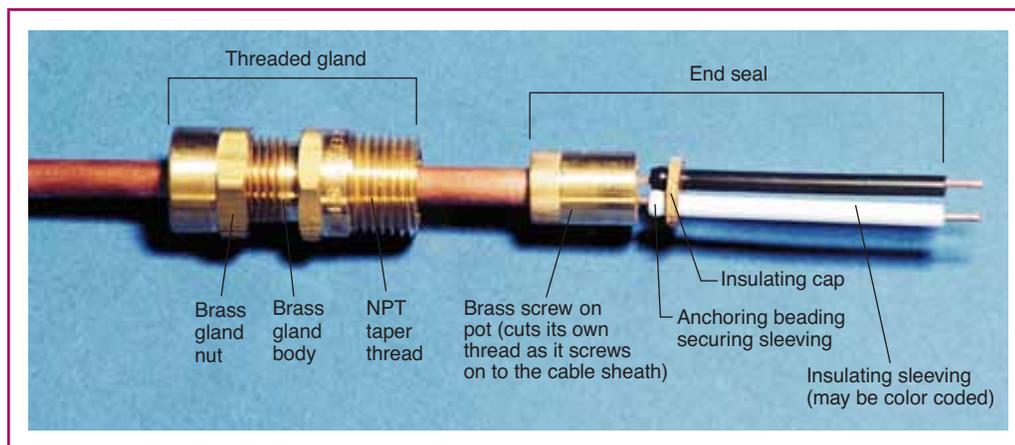

EXHIBIT 332.2 A Type MI cable fitting used for terminating cable to an enclosure, to a box, or directly to equipment. (Courtesy of Tyco Thermal Controls)

fitting is assembled with a special tool and consists of a screw-on pot, insulating cap, insulating sleeving, anchoring bead, and sealing compound.

(B) Terminal Seals. Where Type MI cable terminates, an end seal fitting shall be installed immediately after stripping to prevent the entrance of moisture into the insulation. The conductors extending beyond the sheath shall be individually provided with an insulating material.

332.80 Ampacity. The ampacity of Type MI cable shall be determined in accordance with 310.15. The conductor temperature at the end seal fitting shall not exceed the temperature rating of the listed end seal fitting, and the installation shall not exceed the temperature ratings of terminations or equipment.

(A) Type MI Cable Installed in Cable Tray. The ampacities for Type MI cable installed in cable tray shall be determined in accordance with 392.80(A).

(B) Single Type MI Conductors Grouped Together. Where single Type MI conductors are grouped together in a triangular or square configuration, as required by 332.31, and installed on a messenger or exposed with a maintained free air space of not less than 2.15 times one conductor diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of Table 310.15(B)(17).

The temperature limitation of both the electrical equipment terminals and the cable fitting must be coordinated with the ampacity of the cables. Where Type MI cable is constructed using nickel conductors or nickel-coated copper conductors the allowable ampacities of Tables 310.15(B)(16) through 310.15(B)(18) do not apply, and the product manufacturer must be consulted for proper ampacities.

Part III. Construction Specifications

332.104 Conductors. Type MI cable conductors shall be of solid copper, nickel, or nickel-coated copper with a resistance corresponding to standard AWG and kcmil sizes.

332.108 Equipment Grounding Conductor. Where the outer sheath is made of copper, it shall provide an adequate path to serve as an equipment grounding conductor. Where the outer sheath is made of steel, a separate equipment grounding conductor shall be provided.

The copper sheath of Type MI cable must be constructed as an EGC and is permitted to be used as an EGC according to 250.118(9), but an alloy steel outer sheath is not. A separate EGC is required to be used with steel-sheathed cable.

332.112 Insulation. The conductor insulation in Type MI cable shall be a highly compressed refractory mineral that provides proper spacing for all conductors.

332.116 Sheath. The outer sheath shall be of a continuous construction to provide mechanical protection and moisture seal.

 - (C) Type NMS

Part I. General

334.1 Scope. This article covers the use, installation, and construction specifications of nonmetallic-sheathed cable.

Nonmetallic-sheathed cable was first recognized in the 1928 *NEC*® as a substitute for concealed knob-and-tube wiring (Article 394) and open wiring on insulators (Article 398). The original advantages of nonmetallic-sheathed cable over knob-and-tube wiring were that the outer sheath provided continuous protection in addition to the insulation

applied to the conductors; the cable was easily fished in partitions of finished buildings; no insulating supports were required; and only one hole needed to be bored, and that hole could accommodate more than one cable passing through a wood cross member.

334.2 Definitions.

Nonmetallic-Sheathed Cable. A factory assembly of two or more insulated conductors enclosed within an overall nonmetallic jacket.

Type NM. Insulated conductors enclosed within an overall nonmetallic jacket.

Type NMC. Insulated conductors enclosed within an overall, corrosion resistant, nonmetallic jacket.

Type NMS. Insulated power or control conductors with signaling, data, and communications conductors within an overall nonmetallic jacket.

334.6 Listing Requirements. Type NM, Type NMC, and Type NMS cables and associated fittings shall be listed.

ANSI/UL 719, *Standard for Nonmetallic-Sheathed Cables*, requires a construction and performance evaluation, including testing related to flammability, dielectric voltage-withstand, unwinding at low temperatures, pulling through joists, conductor pullout, crushing, and abrasion.

Part II. Installation

334.10 Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following, except as prohibited in 334.12:

- (1) One- and two-family dwellings and their attached or detached garages, and their storage buildings.
- (2) Multi-family dwellings permitted to be of Types III, IV, and V construction.
- (3) Other structures permitted to be of Types III, IV, and V construction. Cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

Informational Note No. 1: Types of building construction and occupancy classifications are defined in NFPA 220-2015, *Standard on Types of Building Construction*, or the applicable building code, or both.

Informational Note No. 2: See **Informative Annex E** for determination of building types [NFPA 220, Table 3-1].

- (4) Cable trays in structures permitted to be Types III, IV, or V where the cables are identified for the use.

Informational Note: See 310.15(A)(3) for temperature limitation of conductors.

- (5) Types I and II construction where installed within raceways permitted to be installed in Types I and II construction.

A well-established means of codifying fire protection and fire safety requirements is to classify buildings by types of construction, based on

materials used for the structural elements and the degree of fire resistance afforded by each element. The five fundamental construction types used by the model building codes are as follows:

Type I (fire resistive)

Type II (noncombustible)

Type III (combination of combustibles and noncombustibles)

Type IV (heavy timber)

Type V (wood frame)

Types I and II basically require all structural elements to be noncombustible, whereas Types III, IV, and V allow some or all of the structural elements to be combustible (wood).

The selection of building construction types is regulated by the local building code, based on the occupancy, height, and area of the building. If a building of a selected height (in feet or stories above grade) and area is permitted to be built of combustible construction (i.e., Types III, IV, or V), the installation of nonmetallic-sheathed cable is permitted. Common areas (corridors) and incidental and subordinate uses (such as laundry rooms or lounge rooms) that serve a multifamily dwelling occupancy are also considered part of the multifamily occupancy. NM cable is allowed in these areas.

If a building is of noncombustible construction (Type I or II) by the owner's choice, even though the building code would permit combustible construction, the building is allowed to be wired with NM cable. In such an instance, NM cable may be installed in the noncombustible building because the building code would have permitted the building to be of combustible construction.

Informative Annex E provides information on the types of construction as well as a table that cross-references the five construction types to the types described in the model building codes.

If Type I or Type II construction is required, **Section 334.10(5)** permits NM cables to be installed if the cables are in a raceway. A raceway is only permitted to be used if it complies with the article for the raceway and its use does not violate another article in the *NEC*.

(A) Type NM. Type NM cable shall be permitted as follows:

- (1) For both exposed and concealed work in normally dry locations except as prohibited in 334.10(3)
- (2) To be installed or fished in air voids in masonry block or tile walls

For concealed work, cable should be installed where it is protected from physical damage often caused by nails or screws. Where practical, care should be taken to avoid areas where trim, door and window casings, baseboards, moldings, and so forth are likely to be nailed.

See also

300.4 for details on protection against physical damage

(B) Type NMC. Type NMC cable shall be permitted as follows:

- (1) For both exposed and concealed work in dry, moist, damp, or corrosive locations, except as prohibited by 334.10(3)
- (2) In outside and inside walls of masonry block or tile
- (3) In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1.59 mm (1/16 in.) thick and covered with plaster, adobe, or similar finish

If NM cable is used in dairy barns and similar farm buildings (see [Article 547](#)), it must be Type NMC (corrosion resistant). The cable will be exposed to fumes, vapors, or liquids such as ammonia and barnyard acids. Under such circumstances, ordinary types of NM cable can deteriorate rapidly due to ammonia fumes or the growth of fungus or mold.

(C) Type NMS. Type NMS cable shall be permitted as follows:

- (1) For both exposed and concealed work in normally dry locations except as prohibited by [334.10\(3\)](#)
- (2) To be installed or fished in air voids in masonry block or tile walls

334.12 Uses Not Permitted.

Restrictions of use of NM cable also exist elsewhere in the *NEC*. For example, NM cables are not permitted to be installed in ducts, plenums, and other air-handling spaces.

See also

[300.22](#), which limits the use of materials in ducts, plenums, and other air-handling spaces that may contribute smoke and products of combustion during a fire

(A) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be permitted as follows:

- (1) In any dwelling or structure not specifically permitted in [334.10\(1\)](#), (2), (3), and (5)
- (2) Exposed within a dropped or suspended ceiling cavity in other than one- and two-family and multifamily dwellings

Nonmetallic-sheathed cables are prohibited in the space above hung ceilings that allow access. This requirement does not apply to dwelling-type occupancies. The term *exposed* as used in this requirement, meets the definition of *exposed (as applied to wiring methods)* found in [Article 100](#), which states “on or attached to the surface or behind panels designed to allow access.”

For example, cables installed above a gypsum board ceiling or soffit would not be considered exposed cable, if the area above the ceiling is not accessible (does not have removable tiles or does not contain an access panel). Because hung or dropped ceilings are often accessible, cables installed above these types of ceilings would be considered exposed cables if the cables do not have additional physical protection.

A simple change to an architectural finish schedule during construction could change the acceptability of the wiring method. For example, if a corridor ceiling in an occupancy (other than a dwelling type) called for a painted gypsum board ceiling and the finish schedule changed the ceiling construction to a suspended ceiling, NM cable would not be permitted unless the cable was installed using additional protection.

See also

[334.15\(B\)](#) for examples of additional protection

- (3) As service-entrance cable
- (4) In commercial garages having hazardous (classified) locations as defined in [511.3](#)
- (5) In theaters and similar locations, except where permitted in [518.4\(B\)](#)

- (6) In motion picture studios
- (7) In storage battery rooms
- (8) In hoistways or on elevators or escalators
- (9) Embedded in poured cement, concrete, or aggregate
- (10) In hazardous (classified) locations, except where specifically permitted by other articles in this *Code*

(B) Types NM and NMS. Types NM and NMS cables shall not be used under the following conditions or in the following locations:

- (1) Where exposed to corrosive fumes or vapors
- (2) Where embedded in masonry, concrete, adobe, fill, or plaster
- (3) In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish
- (4) In wet or damp locations

334.15 Exposed Work. In exposed work, except as provided in [300.11\(A\)](#), cable shall be installed as specified in [334.15\(A\)](#) through (C).

(A) To Follow Surface. Cable shall closely follow the surface of the building finish or of running boards.

(B) Protection from Physical Damage. Cable shall be protected from physical damage where necessary by rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC conduit, Type RTRC marked with the suffix -XW, or other approved means. Where passing through a floor, the cable shall be enclosed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC conduit, Type RTRC marked with the suffix -XW, or other approved means extending at least 150 mm (6 in.) above the floor.

Type NMC cable installed in shallow chases or grooves in masonry, concrete, or adobe shall be protected in accordance with the requirements in [300.4\(F\)](#) and covered with plaster, adobe, or similar finish.

(C) In Unfinished Basements and Crawl Spaces. Where cable is run at angles with joists in unfinished basements and crawl spaces, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. Nonmetallic-sheathed cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or shall be protected in accordance with [300.4](#). Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point the cable enters the raceway. The sheath of the nonmetallic-sheathed cable shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (¼ in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be connected to an equipment grounding conductor complying with the provisions of [250.86](#) and [250.148](#).

EXHIBIT 334.1 Nonmetallic-sheathed cables and Type SE cables installed in an unfinished basement or crawl space.

NM cable installed in crawl spaces is more susceptible to physical damage due to the limited height of the space. Specific means of physical protection in crawl spaces and unfinished basements can include the use of raceways, guard strips, and so forth.

Nonmetallic-sheathed cables installed in an unfinished basement or crawl space can be run through holes in joists, attached to the side of joists or beams, and installed on running boards as shown on the left side in [Exhibit 334.1](#).

See also

[300.4\(D\)](#), which requires cables that run parallel to framing members be installed at least 1¼ inches from the nearest edge of studs, joists, or rafters

334.17 Through or Parallel to Framing Members. Types NM, NMC, or NMS cable shall be protected in accordance with [300.4](#) where installed through or parallel to framing members. Grommets used as required in [300.4\(B\)\(1\)](#) shall remain in place and be listed for the purpose of cable protection.

Cable that passes through factory- or field-punched holes in metal studs or similar members is required to be protected in accordance with [300.4\(B\)\(1\)](#). Listed bushings or listed grommets covering all metal edges must be securely fastened in the opening before the cable is installed.

See also

[300.4\(B\)\(1\)](#) and its commentary for more information on physical protection of NM cables

334.23 In Accessible Attics. The installation of cable in accessible attics or roof spaces shall also comply with [320.23](#).

334.24 Bending Radius. Bends in Types NM, NMC, and NMS cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend during or after installation shall not be less than five times the diameter of the cable.

334.30 Securing and Supporting. Nonmetallic-sheathed cable shall be supported and secured by staples; cable ties listed and

identified for securement and support; or straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4½ ft) and within 300 mm (12 in.) of every cable entry into enclosures such as outlet boxes, junction boxes, cabinets, or fittings. Flat cables shall not be stapled on edge.

Sections of cable protected from physical damage by raceway shall not be required to be secured within the raceway.

Draping the cable over air ducts, rafters, timbers, joists, pipes, and ceiling grid members without securing the cable with approved means is not permitted, except where the cable is fished, as allowed in [334.30\(B\)\(1\)](#).

Two-conductor NM cable (or other flat configurations) is prohibited from being stapled on edge (that is, with its short dimension against a wood joist). If the staple is driven too far into the stud, damage to the insulation and conductors could occur.

See also

[300.4\(C\)](#) for support requirements of cables through spaces behind panels designed to allow access

(A) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with [300.4](#) shall be considered to be supported and secured where such support does not exceed 1.4-m (4½-ft) intervals and the nonmetallic-sheathed cable is securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other nonmetallic-sheathed cable termination.

Informational Note: See [314.17\(C\)](#) for support where nonmetallic boxes are used.

Cable running horizontally through framing members (spaced less than 54 inches apart) and passing through bored or punched holes in the framing members is considered to be supported by the framing members. Additional securing or fastening with cable ties is not required. However, the cable must be secured within 12 inches of the outlet box. Where the cable terminates at a nonmetallic outlet box that does not contain a cable clamping device, the cable may be secured (fastened in place) within 8 inches of the outlet box, according to [314.17\(C\)](#), Exception.

(B) Unsupported Cables. Nonmetallic-sheathed cable shall be permitted to be unsupported where the cable:

- (1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable.
- (2) Is not more than 1.4 m (4½ ft) from the last point of cable support to the point of connection to a luminaire or other piece of electrical equipment and the cable and point of connection are within an accessible ceiling in one-, two-, or multifamily dwellings.

(C) Wiring Device Without a Separate Outlet Box. A wiring device identified for the use, without a separate outlet box, and incorporating an integral cable clamp shall be permitted where the cable is secured in place at intervals not exceeding 1.4 m (4½ ft) and within 300 mm (12 in.) from the wiring device wall opening, and there shall be at least a 300 mm (12 in.) loop of unbroken cable or 150 mm (6 in.) of a cable end available on the interior side of the finished wall to permit replacement.

334.40 Boxes and Fittings.

(A) Boxes of Insulating Material. Nonmetallic outlet boxes shall be permitted as provided by 314.3.

Nonmetallic boxes and nonmetallic wiring systems are recommended for use in some corrosive atmospheres, such as farm buildings.

See also

Article 547 for details specific to agricultural buildings

(B) Devices of Insulating Material. Self-contained switches, self-contained receptacles, and nonmetallic-sheathed cable interconnector devices of insulating material that are listed shall be permitted to be used without boxes in exposed cable wiring and for repair wiring in existing buildings where the cable is concealed. Openings in such devices shall form a close fit around the outer covering of the cable, and the device shall fully enclose the part of the cable from which any part of the covering has been removed. Where connections to conductors are by binding-screw terminals, there shall be available as many terminals as conductors.

(C) Devices with Integral Enclosures. Wiring devices with integral enclosures identified for such use shall be permitted as provided by 300.15(E).

334.80 Ampacity. The ampacity of Types NM, NMC, and NMS cable shall be determined in accordance with 310.15. The allowable ampacity shall not exceed that of a 60°C (140°F) rated conductor. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction calculations, provided the final calculated ampacity does not exceed that of a 60°C (140°F) rated conductor. The ampacity of Types NM, NMC, and NMS cable installed in cable trays shall be determined in accordance with 392.80(A).

Where more than two NM cables containing two or more current-carrying conductors are installed, without maintaining spacing between the cables, through the same opening in wood

framing that is to be sealed with thermal insulation, caulk, or sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(3)(a) and the provisions of 310.15(A)(2), Exception, shall not apply.

Where more than two NM cables containing two or more current-carrying conductors are installed in contact with thermal insulation without maintaining spacing between cables, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(3)(a).

As stated in 310.15(B)(3)(a), “. . . where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 millimeters (24 inches) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(3)(a).” Failure to apply the appropriate ampacity adjustment factor called for by this table, where NM cables are stacked or bundled without maintaining spacing, can lead to overheating of conductors. The ampacity adjustment requirements prevent overheating of the conductors where passing through wood-framed draft- and fire-stopping material or in direct contact with thermal insulation. Not only is thermal insulation provided within structures to reduce heat loss or heat gain, but the same thermal insulation material may be used to control sound within structures as well.

Calculation Example

Four 2-conductor, size 12 AWG, copper with ground, Type NM cables are installed in direct contact with thermal insulation without maintaining spacing. Calculate the ampacity of the conductors according to the requirements of 334.80, and determine the maximum overcurrent protection permitted for the four circuits.

Solution

Step 1. Determine the number of current-carrying conductors.

$$4 \text{ cables} \times 2 \text{ conductors per cable} = \\ 8 \text{ current-carrying conductors}$$

Step 2. Determine the initial conductor ampacity. Using the 90°C copper ampacity from Table 310.15(B)(16) for derating purposes, the initial ampacity of 12 AWG is 30 A.

Step 3. Determine the adjusted conductor ampacity. Due to the direct contact with thermal insulation, use Table 310.15(B)(3)(a). Eight current-carrying conductors require an adjustment factor of 70 percent.

$$30 \text{ A} \times 0.7 = 21 \text{ A (adjusted)}$$

Section 334.80 does not allow an ampacity greater than given in the 60°C column of Table 310.15(B)(16); therefore, the conductor ampacity is limited to 20 A.

Step 4. Determine the maximum permitted overcurrent device for each circuit. According to the footnote of Table 310.15(B)(16), conductor sizes 14 AWG through 10 AWG must also comply with 240.4(D). Section 240.4(D) limits protection of a 12 AWG copper conductor to a maximum of 20 A.

Conclusion. The final ampacity for each current-carrying conductor is 20 A, and the maximum overcurrent device permitted for each of the four circuits is 20 A.

This example points out that the 14 AWG to 10 AWG NM cable typically used for branch circuits can be installed without spacing and placed within thermal insulation with little impact on most installations. For similar installations, as long as the bundle is limited to not more than nine current-carrying conductors, the adjusted ampacity will not be below the overcurrent protection set in 240.4(D).

Part III. Construction Specifications

334.100 Construction. The outer cable sheath of nonmetallic-sheathed cable shall be a nonmetallic material.

334.104 Conductors. The 600-volt insulated conductors shall be sizes 14 AWG through 2 AWG copper conductors or sizes 12 AWG through 2 AWG aluminum or copper-clad aluminum conductors. The communications conductors shall comply with Part V of Article 800.

334.108 Equipment Grounding Conductor. In addition to the insulated conductors, the cable shall have an insulated, covered, or bare equipment grounding conductor.

334.112 Insulation. The insulated power conductors shall be one of the types listed in Table 310.104(A) that are suitable for branch-circuit wiring or one that is identified for use in these cables. Conductor insulation shall be rated at 90°C (194°F).

Informational Note: Types NM, NMC, and NMS cable identified by the markings NM-B, NMC-B, and NMS-B meet this requirement.

334.116 Sheath. The outer sheath of nonmetallic-sheathed cable shall comply with 334.116(A), (B), and (C).

(A) **Type NM.** The overall covering shall be flame retardant and moisture resistant.

(B) **Type NMC.** The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.

(C) **Type NMS.** The overall covering shall be flame retardant and moisture resistant. The sheath shall be applied so as to separate the power conductors from the communications conductors.

Part I. General

336.1 Scope. This article covers the use, installation, and construction specifications for power and control tray cable, Type TC.

The basic standard to investigate tray cable is ANSI/UL 1277, *Electrical Power and Control Tray Cables with Optional Optical-Fiber Members*. Summary information regarding listed power and control tray cable may be found in the *UL Guide Information for Electrical Equipment — The White Book*, under category QPOR.

336.2 Definition.

Power and Control Tray Cable, Type TC. A factory assembly of two or more insulated conductors, with or without associated bare or covered grounding conductors, under a nonmetallic jacket.

336.6 Listing Requirements. Type TC cables and associated fittings shall be listed.

Part II. Installation

336.10 Uses Permitted. Type TC cable shall be permitted to be used as follows:

- (1) For power, lighting, control, and signal circuits.
- (2) In cable trays, including those with mechanically discontinuous segments up to 300 mm (1 ft).
- (3) In raceways.
- (4) In outdoor locations supported by a messenger wire.
- (5) For Class 1 circuits as permitted in Parts II and III of Article 725.
- (6) For non-power-limited fire alarm circuits if conductors comply with the requirements of 760.49.

The cable conductor material must be copper according to 760.49. Aluminum and copper-clad aluminum conductors are not permitted for fire alarm circuits.

- (7) Between a cable tray and the utilization equipment or device(s), provided all of the following apply:
 - a. The cable is Type TC-ER.
 - b. The cable is installed in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation.

- c. The cable is continuously supported and protected against physical damage using mechanical protection such as struts, angles, or channels.
- d. The cable that complies with the crush and impact requirements of Type MC cable and is identified with the marking “TC-ER.”
- e. The cable is secured at intervals not exceeding 1.8 m (6 ft).
- f. Equipment grounding for the utilization equipment is provided by an equipment grounding conductor within the cable. In cables containing conductors sized 6 AWG or smaller, the equipment grounding conductor must be provided within the cable or, at the time of installation, one or more insulated conductors must be permanently identified as an equipment grounding conductor in accordance with 250.119(B).

Exception to (7): Where not subject to physical damage, Type TC-ER shall be permitted to transition between cable trays and between cable trays and utilization equipment or devices for a distance not to exceed 1.8 m (6 ft) without continuous support. The cable shall be mechanically supported where exiting the cable tray to ensure that the minimum bending radius is not exceeded.

Specific types of tray cable are permitted to extend from a cable tray to a piece of equipment without the use of conduit. According to UL 1277, *Electrical Power and Control Tray Cables with Optional Optical-Fiber Members*, cables suitable for use as exposed wiring between cable tray and the utilization equipment are surface-marked “Type TC-ER” (tray cable for exposed runs).

The exception permits TC-ER cable to exit a cable tray without continuous support for a maximum of 6 feet. However, extension from cable tray to cable tray or from cable tray to equipment is not allowed beyond 6 feet without continuous support.

- (8) Where installed in wet locations, Type TC cable shall also be resistant to moisture and corrosive agents.
- (9) In one- and two-family dwelling units, Type TC-ER cable containing both power and control conductors that is identified for pulling through structural members shall be permitted. Type TC-ER cable used as interior wiring shall be installed per the requirements of Part II of Article 334.

Exception: Where used to connect a generator and associated equipment having terminals rated 75°C (140°F) or higher, the cable shall not be limited in ampacity by 334.80 or 340.80.

Informational Note No. 1: TC-ER cable that is suitable for pulling through structural members is marked “JP.”

Informational Note No. 2: See 725.136 for limitations on Class 2 or 3 circuits contained within the same cable with conductors of electric light, power, or Class 1 circuits.

Power conductors and control conductors are run between a generator and transfer switch or between equipment of an HVAC system.

EXHIBIT 336.1 TC-ER cable installed in accordance with Part II of Article 334. (Courtesy of Generac Power Systems, Inc.)

Type TC-ER cable allows the power and control circuit conductors to occupy the same cable. See Exhibit 336.1 for an example of TC-ER cable installed in a dwelling unit.

- (10) Direct buried, where identified for such use

Informational Note: See 310.15(A)(3) for temperature limitation of conductors.

336.12 Uses Not Permitted. Type TC tray cable shall not be installed or used as follows:

- (1) Installed where it will be exposed to physical damage
- (2) Installed outside a raceway or cable tray system, except as permitted in 336.10(4), 336.10(7), 336.10(9), and 336.10(10)
- (3) Used where exposed to direct rays of the sun, unless identified as sunlight resistant

336.24 Bending Radius. Bends in Type TC cable shall be made so as not to damage the cable. For Type TC cable without metal shielding, the minimum bending radius shall be as follows:

- (1) Four times the overall diameter for cables 25 mm (1 in.) or less in diameter
- (2) Five times the overall diameter for cables larger than 25 mm (1 in.) but not more than 50 mm (2 in.) in diameter
- (3) Six times the overall diameter for cables larger than 50 mm (2 in.) in diameter

Type TC cables with metallic shielding shall have a minimum bending radius of not less than 12 times the cable overall diameter.

336.80 Ampacity. The ampacity of Type TC tray cable shall be determined in accordance with 392.80(A) for 14 AWG and larger conductors, in accordance with 402.5 for 18 AWG through 16 AWG conductors where installed in cable tray, and in accordance with 310.15 where installed in a raceway or as messenger-supported wiring.

Part III. Construction Specifications

336.100 Construction. A metallic sheath or armor as defined in 330.116 shall not be permitted either under or over the non-metallic jacket. Metallic shield(s) shall be permitted over groups of conductors, under the outer jacket, or both.

Type TC cables are permitted to have one or more metal shields but not a metal sheath or armor.

See also

Article 320 or Article 330 for requirements for electrical cables with armor or a metal sheath

336.104 Conductors. The insulated conductors of Type TC cables shall be in sizes 18 AWG to 1000 kcmil copper, nickel, or nickel-coated copper, and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum. Insulated conductors of sizes 14 AWG, and larger copper, nickel, or nickel-coated copper, and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum shall be one of the types listed in Table 310.104(A) or Table 310.104(B) that is suitable for branch circuit and feeder circuits or one that is identified for such use.

The use of nickel and nickel-coated copper conductor material is permitted by 310.106(B) and shown in Table 310.104(A) for insulation types PFAH and TFE (and used in high-temperature applications).

(A) Fire Alarm Systems. Where used for fire alarm systems, conductors shall also be in accordance with 760.49.

(B) Thermocouple Circuits. Conductors in Type TC cable used for thermocouple circuits in accordance with Part III of Article 725 shall also be permitted to be any of the materials used for thermocouple extension wire.

(C) Class 1 Circuit Conductors. Insulated conductors of 18 AWG and 16 AWG copper shall also be in accordance with 725.49.

336.116 Jacket. The outer jacket shall be a flame-retardant, nonmetallic material.

336.120 Marking. There shall be no voltage marking on a Type TC cable employing thermocouple extension wire.

- 338.24 Bending Radius

Part III. Construction Specifications

- 338.100 Construction
- 338.120 Marking

Part I. General

338.1 Scope. This article covers the use, installation, and construction specifications of service-entrance cable.

According to the UL *Guide Information for Electrical Equipment — The White Book*, category TYLZ cable (service-entrance cable rated 600 volts) is listed in sizes 14 AWG and larger for copper and 12 AWG and larger for aluminum or copper-clad aluminum. Type SE cable contains Types RHW, RHW-2, XHHW, XHHW-2, THWN, or THWN-2 conductors. Type USE cable contains conductors with insulation equivalent to RHW or XHHW. Type USE-2 contains insulation equivalent to RHW-2 or XHHW-2 and is rated 90°C, wet or dry.

The type designation of the conductors may be marked on the cable surface. If used, this marking indicates the temperature rating for the cable corresponding to the temperature rating of the conductors. If this marking does not appear, the temperature rating of the cable is 75°C. The cables are designated as Type SE, Type USE or USE-2, and submersible water pump cable.

Type SE — Cable suitable for aboveground installations. Both the insulated conductors and the outer jacket are suitable for use where exposed to sunlight.

Type USE or USE-2 — Cable suitable for underground installations, including direct burial. Although both the conductor insulation and outer covering are suitable for use where exposed to sunlight, the cables are not suitable inside the premises or aboveground other than to terminate at service or metering equipment.

Submersible water pump cable — A multiconductor cable containing two, three, or four single-conductor, Type USE or USE-2 cables in a flat or twisted assembly. The cable is tag-marked "For use within the well

casing for wiring deep-well water pumps where the cable is not subject to repetitive handling caused by frequent servicing of the pump units.”

338.2 Definitions.

Service-Entrance Cable. A single conductor or multiconductor assembly provided with or without an overall covering, primarily used for services, and of the following types:

Type SE. Service-entrance cable having a flame-retardant, moisture-resistant covering.

Type USE. Service-entrance cable, identified for underground use, having a moisture-resistant covering, but not required to have a flame-retardant covering.

N 338.6 Listing Requirements. Type SE and USE cables and associated fittings shall be listed.

Part II. Installation

338.10 Uses Permitted.

(A) Service-Entrance Conductors. Service-entrance cable shall be permitted to be used as service-entrance conductors and shall be installed in accordance with 230.6, 230.7, and Parts II, III, and IV of Article 230.

(B) Branch Circuits or Feeders.

(1) Grounded Conductor Insulated. Type SE service-entrance cables shall be permitted in wiring systems where all of the circuit conductors of the cable are of the thermoset or thermoplastic type.

Branch circuits using Type SE cable as a wiring method are permitted only if all circuit conductors within the cable are insulated. The EGC is the only conductor permitted to be bare or covered within Type SE cable used for branch circuits.

(2) Use of Uninsulated Conductor. Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.

Exception: In existing installations, uninsulated conductors shall be permitted as a grounded conductor in accordance with 250.32 and 250.140, where the uninsulated grounded conductor of the cable originates in service equipment, and with 225.30 through 225.40.

Service-entrance cable containing a bare grounded (neutral) conductor is not permitted for new installations where it is used as a branch circuit to supply appliances such as ranges, wall-mounted ovens, counter-mounted cooking units, or clothes dryers. The exception permits a bare neutral service-entrance cable for existing installations only.

(3) Temperature Limitations. Type SE service-entrance cable used to supply appliances shall not be subject to conductor

temperatures in excess of the temperature specified for the type of insulation involved.

(4) Installation Methods for Branch Circuits and Feeders.

(a) *Interior Installations.* In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334, excluding 334.80.

For Type SE cable with ungrounded conductor sizes 10 AWG and smaller, where installed in thermal insulation, the ampacity shall be in accordance with 60°C (140°F) conductor temperature rating. The maximum conductor temperature rating shall be permitted to be used for ampacity adjustment and correction purposes, if the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.

Informational Note No. 1: See 310.15(A)(3) for temperature limitation of conductors.

Informational Note No. 2: For the installation of main power feeder conductors in dwelling units refer to 310.15(B)(7).

Type SE cable is used for a variety of interior circuits including ranges, clothes dryers, heating, and air-conditioning equipment and as feeders to supply panelboards that are not the service equipment.

While all conductors in nonmetallic-sheathed cable are required to have an insulation temperature rating of 90°C, 334.80 limits the operating (calculated load) ampacity to those contained in the 60°C column of Table 310.15(B)(16). This limitation applies to all uses of NM cable. In contrast to this restriction, Type SE cable is only limited to operating at a 60°C ampacity when the ungrounded conductor sizes are 10 AWG and smaller and it is installed in thermal insulation. Type SE cable is permitted to have conductors with either 75°C or 90°C insulation. If the cable surface does not have a temperature marking, the conductors have a 75°C insulation temperature rating, and ampacity adjustment or correction is based on that rating. If the cable is marked with a conductor insulation temperature rating, ampacity adjustment or correction of the conductor can be made based on the conductor temperature marked on the cable.

Where Type SE cable with ungrounded conductor sizes 10 AWG and smaller is installed in thermal insulation, the adjusted and/or corrected operating ampacity of the conductors cannot exceed those contained in the 60°C column of Table 310.15(B)(16). If the cable is not installed in thermal insulation, the limiting factor on conductor ampacity is the requirement, as stated in 110.14(C), for coordinating the operating ampacity of the conductor with the terminal temperature ratings of the electrical equipment.

(b) *Exterior Installations.* In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed in accordance with Part I of Article 225. The cable shall be supported in accordance with 334.30. Type USE cable installed as underground feeder and branch circuit cable shall comply with Part II of Article 340.

Exception: Single-conductor Type USE and multi-rated USE conductors shall not be subject to the ampacity limitations of Part II of Article 340.

338.12 Uses Not Permitted.

(A) Service-Entrance Cable. Service-entrance cable (SE) shall not be used under the following conditions or in the following locations:

- (1) Where subject to physical damage unless protected in accordance with 230.50(B)
- (2) Underground with or without a raceway
- (3) For exterior branch circuits and feeder wiring unless the installation complies with the provisions of Part I of Article 225 and is supported in accordance with 334.30 or is used as messenger-supported wiring as permitted in Part II of Article 396

(B) Underground Service-Entrance Cable. Underground service-entrance cable (USE) shall not be used under the following conditions or in the following locations:

- (1) For interior wiring
- (2) For aboveground installations except where USE cable emerges from the ground and is terminated in an enclosure at an outdoor location and the cable is protected in accordance with 300.5(D)
- (3) As aerial cable unless it is a multiconductor cable identified for use aboveground and installed as messenger-supported wiring in accordance with 225.10 and Part II of Article 396

Cables marked only as "Type USE service-entrance cable" are not required to have a flame-retardant covering, according to 338.2.

338.24 Bending Radius. Bends in Types USE and SE cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend, during or after installation, shall not be less than five times the diameter of the cable.

Part III. Construction Specifications

338.100 Construction. Cabled, single-conductor, Type USE constructions recognized for underground use shall be permitted to have a bare copper conductor cabled with the assembly. Type USE single, parallel, or cabled conductor assemblies recognized for underground use shall be permitted to have a bare copper concentric conductor applied. These constructions shall not require an outer overall covering.

Informational Note: See 230.41, Exception, item (2), for directly buried, uninsulated service-entrance conductors.

Type SE or USE cable containing two or more conductors shall be permitted to have one conductor uninsulated.

338.120 Marking. Service-entrance cable shall be marked as required in 310.120. Cable with the neutral conductor smaller than the ungrounded conductors shall be so marked.

Underground Feeder and Branch-Circuit Cable: Type UF

Contents

Part I. General

- 340.1 Scope
- 340.2 Definition
- 340.6 Listing Requirements

Part II. Installation

- 340.10 Uses Permitted
- 340.12 Uses Not Permitted
- 340.24 Bending Radius
- 340.80 Ampacity

Part III. Construction Specifications

- 340.104 Conductors
- 340.108 Equipment Grounding Conductor
- 340.112 Insulation
- 340.116 Sheath

Part I. General

340.1 Scope. This article covers the use, installation, and construction specifications for underground feeder and branch-circuit cable, Type UF.

340.2 Definition.

Underground Feeder and Branch-Circuit Cable, Type UF. A factory assembly of one or more insulated conductors with an integral or an overall covering of nonmetallic material suitable for direct burial in the earth.

340.6 Listing Requirements. Type UF cable and associated fittings shall be listed.

Part II. Installation

340.10 Uses Permitted. Type UF cable shall be permitted as follows:

- (1) For use underground, including direct burial in the earth. For underground requirements, see 300.5.
- (2) As single-conductor cables. Where installed as single-conductor cables, all conductors of the feeder grounded conductor or branch circuit, including the grounded conductor and equipment grounding conductor, if any, shall be installed in accordance with 300.3.

- (3) For wiring in wet, dry, or corrosive locations under the recognized wiring methods of this *Code*.
- (4) Installed as nonmetallic-sheathed cable. Where so installed, the installation and conductor requirements shall comply with **Parts II and III** of **Article 334** and shall be of the multiconductor type.

If Type UF cable is installed as nonmetallic-sheathed cable, the ampacity adjustment in **334.80** applies.

- (5) For solar photovoltaic systems in accordance with **690.31**.
- (6) As single-conductor cables as the nonheating leads for heating cables as provided in **424.43**.
- (7) Supported by cable trays. Type UF cable supported by cable trays shall be of the multiconductor type.

Informational Note: See **310.15(A)(3)** for temperature limitation of conductors.

340.12 Uses Not Permitted. Type UF cable shall not be used as follows:

- (1) As service-entrance cable
- (2) In commercial garages
- (3) In theaters and similar locations
- (4) In motion picture studios
- (5) In storage battery rooms
- (6) In hoistways or on elevators or escalators
- (7) In hazardous (classified) locations, except as specifically permitted by other articles in this *Code*
- (8) Embedded in poured cement, concrete, or aggregate, except where embedded in plaster as nonheating leads where permitted in **424.43**
- (9) Where exposed to direct rays of the sun, unless identified as sunlight resistant
- (10) Where subject to physical damage
- (11) As overhead cable, except where installed as messenger-supported wiring in accordance with **Part II** of **Article 396**

Type UF cable suitable for exposure to the direct rays of the sun is tagged and marked with the designation "Sunlight Resistant." This physical protection requirement ensures that Type UF cable, as it emerges from underground, is protected from ultraviolet damage.

340.24 Bending Radius. Bends in Type UF cable shall be so made that the cable is not damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the cable.

340.80 Ampacity. The ampacity of Type UF cable shall be that of 60°C (140°F) conductors in accordance with **310.15**.

If Type UF cable is installed as nonmetallic-sheathed cable, the ampacity of the cable is determined according to rules for Type NM cable in **334.80**.

See also

340.10(4) and its commentary

Part III. Construction Specifications

340.104 Conductors. The conductors shall be sizes 14 AWG copper or 12 AWG aluminum or copper-clad aluminum through 4/0 AWG.

340.108 Equipment Grounding Conductor. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare equipment grounding conductor.

340.112 Insulation. The conductors of Type UF shall be one of the moisture-resistant types listed in **Table 310.104(A)** that is suitable for branch-circuit wiring or one that is identified for such use. Where installed as a substitute wiring method for NM cable, the conductor insulation shall be rated 90°C (194°F).

340.116 Sheath. The overall covering shall be flame retardant; moisture, fungus, and corrosion resistant; and suitable for direct burial in the earth.

342.60 Grounding
342.100 Construction

Part III. Construction Specifications

342.120 Marking
342.130 Standard Lengths

Part I. General

342.1 Scope. This article covers the use, installation, and construction specifications for intermediate metal conduit (IMC) and associated fittings.

IMC is thinner-walled and lighter in weight than RMC and is satisfactory for uses in all locations where RMC is permitted to be used. Threaded fittings, couplings, connectors, and so forth are interchangeable between IMC and RMC. Threadless fittings for IMC are suitable only for the type of conduit indicated by the carton marking.

342.2 Definition.

Intermediate Metal Conduit (IMC). A steel threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings.

342.6 Listing Requirements. IMC, factory elbows and couplings, and associated fittings shall be listed.

Part II Installation

342.10 Uses Permitted.

(A) All Atmospheric Conditions and Occupancies. Use of IMC shall be permitted under all atmospheric conditions and occupancies.

(B) Corrosion Environments. IMC, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection approved for the condition.

Other documents, such as the Steel Tube Institute's 2015 *Guidelines for Installing Steel Conduit/Tubing*, and ANSI/NECA 101-2006, *Standard for Installing Steel Conduits (Rigid, IMC, EMT)*, should be consulted for approval guidance of corrosion-resistant materials or for requirements prior to the installation of nonferrous metal (aluminum) conduit in concrete, since chloride additives in the concrete mix may cause corrosion.

(C) Cinder Fill. IMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm (2 in.) thick; where the conduit is not less than 450 mm (18 in.) under the fill; or where protected by corrosion protection approved for the condition.

(D) Wet Locations. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

Informational Note: See 300.6 for protection against corrosion.

Galvanized IMC installed in concrete does not require supplementary corrosion protection. Similarly, galvanized IMC installed in contact with soil does not generally require supplementary corrosion protection. As a guide in the absence of experience with the corrosive effects of soil in a specific location, soils producing severe corrosive effects are generally characterized by low resistivity of less than 2000 ohm-cm.

Wherever ferrous metal conduit runs directly from concrete encasement to soil burial, the metal in contact with the soil can be severely corroded.

342.14 Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.

Aluminum fittings and enclosures shall be permitted to be used with galvanized steel IMC where not subject to severe corrosive influences. Stainless steel IMC shall only be used with stainless steel fittings and approved accessories, outlet boxes, and enclosures.

342.20 Size.

(A) Minimum. IMC smaller than metric designator 16 (trade size ½) shall not be used.

(B) Maximum. IMC larger than metric designator 103 (trade size 4) shall not be used.

Informational Note: See 300 1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

See also

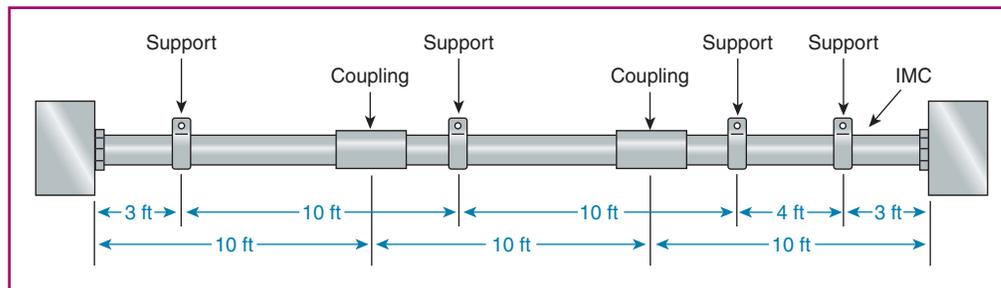

90.9 and Table 300.1(C) commentary for further explanation of metric designators

342.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following Chapter 9, Notes to Tables, Note 6.

To select the proper trade size of IMC, see the appropriate subtable for Article 342, Intermediate Metal Conduit (IMC), in Table 4 of Chapter 9. If the conductors are of the same wire size and insulation type, Tables C.4 and C.4(A) for IMC in Informative Annex C can be used instead of performing the calculations.

EXHIBIT 342.1 Minimum IMC fastening requirements.

342.24 Bends — How Made. Bends of IMC shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in [Table 2, Chapter 9](#).

342.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

The number of bends in one run is limited to reduce pulling tension on conductors. It also helps ensure easy insertion or removal of conductors during later phases of construction, when the conduit may be permanently enclosed by the building's finish.

342.28 Reaming and Threading. All cut ends shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a taper of 1 in 16 ($\frac{3}{4}$ in. aper per foot) shall be used.

Informational Note: See ANSI/ASME B 1.20.1-1983, *Standard for Pipe Threads, General Purpose (Inch)*

Conduit is cut using a saw or a roll cutter (pipe cutter). Care should be taken to ensure a straight cut, given that crooked threads result from a die not started on the pipe squarely. After the cut is made, the conduit must be reamed. Proper reaming removes burrs from the interior of the cut conduit so that as wires and cables are pulled through the conduit, no chafing of the insulation or cable jacket occurs. Finally, the conduit is threaded. The number of threads is important, because cutting too many (or not enough) threads could result in improper assembly of the conduit system. If a threaded ring gauge is not available, the same number of threads should be cut on the conduit as are present on the factory (threaded) end of the conduit.

342.30 Securing and Supporting. IMC shall be installed as a complete system in accordance with [300.18](#) and shall be securely fastened in place and supported in accordance with [342.30\(A\)](#) and (B).

(A) Securely Fastened. IMC shall be secured in accordance with one of the following:

- (1) IMC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination.
- (2) Where structural members do not readily permit fastening within 900 mm (3 ft), fastening shall be permitted to be increased to a distance of 1.5 m (5 ft).

- (3) Where approved, conduit shall not be required to be securely fastened within 900 mm (3 ft) of the service head for above-the-roof termination of a mast.

As illustrated in [Exhibit 342.1](#), IMC is required to be securely fastened within 3 feet of outlet boxes, junction boxes, cabinets, conduit bodies, or other conduit terminations. Couplings are not considered conduit terminations. However, where structural support members do not permit fastening within 3 feet, the support may be located up to 5 feet away. In addition, IMC is required to be supported at least every 10 feet unless permitted otherwise by [342.30\(B\)](#).

(B) Supports. IMC shall be supported in accordance with one of the following:

- (1) Conduit shall be supported at intervals not exceeding 3 m (10 ft).
- (2) The distance between supports for straight runs of conduit shall be permitted in accordance with [Table 344.30\(B\)\(2\)](#), provided the conduit is made up with threaded couplings and supports that prevent transmission of stresses to termination where conduit is deflected between supports
- (3) Exposed vertical risers from industrial machinery or fixed equipment shall be permitted to be supported at intervals not exceeding 6 m (20 ft) if the conduit is made up with threaded couplings, the conduit is supported and securely fastened at the top and bottom of the riser, and no other means of intermediate support is readily available.
- (4) Horizontal runs of IMC supported by openings through framing members at intervals not exceeding 3 m (10 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Lengths of IMC are permitted to be supported (but not necessarily secured) by framing members at 10-foot intervals, provided the IMC is secured and supported at least 3 feet from the box or enclosure. [Exhibit 342.2](#) illustrates an installation where the IMC is installed through the bar joists.

342.42 Couplings and Connectors.

(A) Threadless. Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be the concretetight type. Where installed in wet locations, they shall comply with [314.15](#). Threadless couplings and connectors shall not be used on threaded conduit ends unless listed for the purpose.

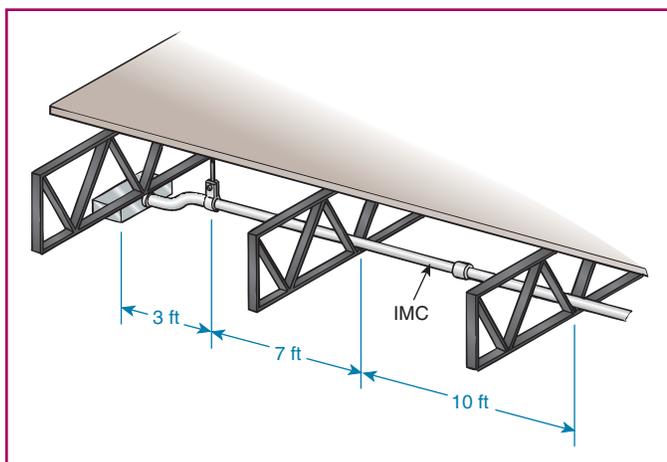

EXHIBIT 342.2 An example of IMC supported by framing members and securely fastened at the 3-foot distance from the box.

See also

344.42(A) commentary for examples of threadless fittings

(B) Running Threads. Running threads shall not be used on conduit for connection at couplings.

342.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wires from abrasion unless the box, fitting, or enclosure is designed to provide such protection.

Informational Note See **300.4(G)** for the protection of conductors 4 AWG and larger at bushings

342.56 Splices and Taps. Splices and taps shall be made in accordance with **300.15**.

342.60 Grounding. IMC shall be permitted as an equipment grounding conductor.

N 342.100 Construction. IMC shall be made of one of the following:

- (1) Steel, with protective coatings
- (2) Stainless steel

Part III. Construction Specifications

342.120 Marking. Each length shall be clearly and durably marked at least every 1.5 m (5 ft) with the letters IMC. Each length shall be marked as required in the first sentence of **110.21(A)**.

342.130 Standard Lengths. The standard length of IMC shall be 3.05 m (10 ft), including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

Part III. Construction Specifications

- 344.100** Construction
- 344.120** Marking
- 344.130** Standard Lengths

Part I. General

344.1 Scope. This article covers the use, installation, and construction specifications for rigid metal conduit (RMC) and associated fittings.

344.2 Definition.

Rigid Metal Conduit (RMC). A threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings.

344.6 Listing Requirements. RMC, factory elbows and couplings, and associated fittings shall be listed.

Part II. Installation

344.10 Uses Permitted.

(A) Atmospheric Conditions and Occupancies.

(1) **Galvanized Steel and Stainless Steel RMC.** Galvanized steel and stainless steel RMC shall be permitted under all atmospheric conditions and occupancies.

(2) **Red Brass RMC.** Red brass RMC shall be permitted to be installed for direct burial and swimming pool applications.

(3) **Aluminum RMC.** Aluminum RMC shall be permitted to be installed where approved for the environment. Rigid aluminum conduit encased in concrete or in direct contact with the earth shall be provided with approved supplementary corrosion protection.

(4) **Ferrous Raceways and Fittings.** Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.

(B) Corrosive Environments.

(1) **Galvanized Steel, Stainless Steel, and Red Brass RMC, Elbows, Couplings, and Fittings.** Galvanized steel, stainless steel, and red brass RMC elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection approved for the condition.

(2) **Supplementary Protection of Aluminum RMC.** Aluminum RMC shall be provided with approved supplementary corrosion protection where encased in concrete or in direct contact with the earth.

Other documents, such as the Steel Tube Institute's 2015 *Guidelines for Installing Steel Conduit/Tubing*, and ANSI/NECA 101-2006, *Standard for Installing Steel Conduits (Rigid, IMC, EMT)*, should be consulted for approval guidance of corrosion-resistant materials or for requirements prior to the installation of nonferrous metal (aluminum) conduit in concrete, since chloride additives in the concrete mix may cause corrosion.

(C) **Cinder Fill.** Galvanized steel, stainless steel, and red brass RMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm (2 in.) thick; where the conduit is not less than 450 mm (18 in.) under the fill; or where protected by corrosion protection approved for the condition.

Although cinder fill is not commonly used in modern construction, it is still encountered at older building sites. Cinders used as fill may contain sulfur, and when they combine with moisture, sulfuric acid is formed, which can corrode metal raceways.

(D) **Wet Locations.** All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

Informational Note: See 300.6 for protection against corrosion.

344.14 Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with galvanized steel RMC, and galvanized steel fittings and enclosures shall be permitted to be used with aluminum RMC where not subject to severe corrosive influences. Stainless steel RMC shall only be used with stainless steel fittings and approved accessories, outlet boxes, and enclosures.

Aluminum rigid conduit can be used with steel fittings and enclosures, as can aluminum fittings and enclosures with steel rigid conduit. Tests show that the galvanic corrosion at steel and aluminum interfaces is minor compared to the natural corrosion on the combination of steel and steel or of aluminum and aluminum. Stainless steel, however, can only be used with other stainless steel parts due to the increased possibility of galvanic action with other metals.

344.20 Size.

(A) **Minimum.** RMC smaller than metric designator 16 (trade size ½) shall not be used.

Exception: For enclosing the leads of motors as permitted in 430.245(B).

(B) **Maximum.** RMC larger than metric designator 155 (trade size 6) shall not be used.

Informational Note: See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

See also

90.9 and **Table 300.1(C)** commentary for further explanation of metric designators

344.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in **Table 1, Chapter 9**.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in **Table 1, Chapter 9**.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and **Table 5** provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following **Chapter 9, Notes to Tables, Note 6**.

To select the proper trade size of RMC, see the appropriate subtable for **Article 344, Rigid Metal Conduit (RMC)**, in **Table 4 of Chapter 9**. If the conductors are of the same wire size and insulation type, **Tables C.9** and **C.9(A)** for RMC in **Informative Annex C** can be used instead of performing the calculations.

344.24 Bends — How Made. Bends of RMC shall be so made that the conduit will not be damaged and so that the internal diameter of the conduit will not be effectively reduced. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in **Table 2, Chapter 9**.

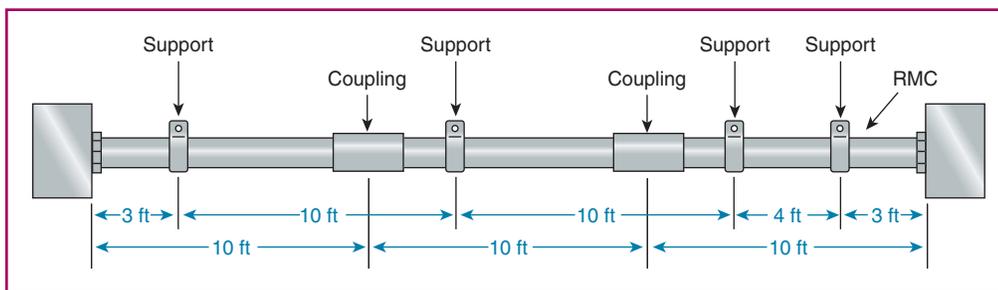

EXHIBIT 344.1 Minimum support required for RMC.

344.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

Limiting the number of bends in a conduit run reduces pulling tension on conductors. It also helps ensure easy insertion or removal of conductors during later phases of construction when the conduit may be permanently enclosed by the finish of the building.

344.28 Reaming and Threading. All cut ends shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a 1 in 16 taper ($\frac{3}{4}$ in. taper per foot) shall be used.

Informational Note: See ANSI/ASME B.1.20.1-1983, *Standard for Pipe Threads, General Purpose (Inch)*.

Conduit is cut using a saw or a roll cutter (pipe cutter). Crooked threads result from a die not started on the pipe squarely. After the cut is made, the conduit must be reamed. Proper reaming removes burrs from the interior of the cut conduit so that as wires and cables are pulled through the conduit, chafing of the insulation or cable jacket does not occur. Finally, the conduit is threaded. The number of threads is important. To determine the correct number of threads for a conduit end, the same number of threads should be cut on the conduit as are present on the factory (threaded) end of the conduit. Where excessive threads are cut on the conduit and threaded couplings are installed, the conduits within the coupling will butt, resulting in a weak mechanical joint and poor grounding continuity.

344.30 Securing and Supporting. RMC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 344.30(A) and (B).

(A) Securely Fastened. RMC shall be secured in accordance with one of the following:

- (1) RMC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination.
- (2) Fastening shall be permitted to be increased to a distance of 1.5 m (5 ft) where structural members do not readily permit fastening within 900 mm (3 ft).
- (3) Where approved, conduit shall not be required to be securely fastened within 900 mm (3 ft) of the service head for above-the-roof termination of a mast.

As illustrated in Exhibit 344.1, RMC is required to be securely fastened within 3 feet of outlet boxes, junction boxes, cabinets, and conduit bodies, or other conduit terminations. Couplings are not considered conduit terminations. However, where structural support members do not permit fastening within 3 feet, secure fastening may be located up to 5 feet away. In addition, RMC is required to be supported at least every 10 feet unless permitted otherwise by 344.30(B).

(B) Supports. RMC shall be supported in accordance with one of the following:

- (1) Conduit shall be supported at intervals not exceeding 3 m (10 ft).
- (2) The distance between supports for straight runs of conduit shall be permitted in accordance with Table 344.30(B)(2), provided the conduit is made up with threaded couplings and supports that prevent transmission of stresses to termination where conduit is deflected between supports.
- (3) Exposed vertical risers from industrial machinery or fixed equipment shall be permitted to be supported at intervals not exceeding 6 m (20 ft) if the conduit is made up with threaded couplings, the conduit is supported and securely fastened at the top and bottom of the riser, and no other means of intermediate support is readily available.
- (4) Horizontal runs of RMC supported by openings through framing members at intervals not exceeding 3 m (10 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Lengths of RMC are permitted to be supported (but not necessarily secured) by framing members at 10-foot intervals, provided the RMC is

TABLE 344.30(B)(2) Supports for Rigid Metal Conduit

Conduit Size		Maximum Distance Between Rigid Metal Conduit Supports	
Metric Designator	Trade Size	m	ft
16–21	$\frac{1}{2}$ – $\frac{3}{4}$	3.0	10
27	1	3.7	12
35–41	$1\frac{1}{4}$ – $1\frac{1}{2}$	4.3	14
53–63	2– $2\frac{1}{2}$	4.9	16
78 and larger	3 and larger	6.1	20

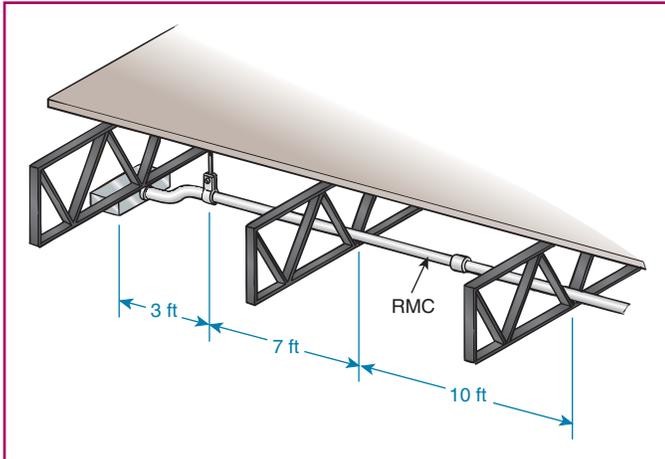

EXHIBIT 344.2 An example of RMC supported by framing members and securely fastened at the 3-foot distance from the box.

secured and supported at least 3 feet from the box or enclosure. Installations where the RMC is installed through bar joists are just one example, as illustrated in [Exhibit 344.2](#).

344.42 Couplings and Connectors.

(A) Threadless. Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be the concrete tight type. Where installed in wet locations, they shall comply with [314.15](#). Threadless couplings and connectors shall not be used on threaded conduit ends unless listed for the purpose

[Exhibit 344.3](#) illustrates two different conduit fittings: a threadless conduit coupling and a threadless conduit connector. Threadless fittings may be suitable for other applications such as in raintight or concrete-tight applications, provided the product itself or the product packaging is marked as such.

In general, threadless fittings are not intended for use over threads, because the fitting will not seat properly. The threaded end of the conduit should be cut off and reamed before installation.

[Exhibit 344.4](#) illustrates a three-piece threaded coupling (the electrical equivalent of a pipe union), which is used to join two lengths of conduit where turning either length is impossible, such as in underground or concrete slab construction. Another fitting for joining conduit is a bolted split coupling.

(B) Running Threads. Running threads shall not be used on conduit for connection at couplings.

344.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wires from abrasion unless the box, fitting, or enclosure is designed to provide such protection.

Informational Note: See [300.4\(G\)](#) for the protection of conductors sizes 4 AWG and larger at bushings.

EXHIBIT 344.3 An example of RMC threadless connector (top) and a threadless coupling (bottom). (Courtesy of Eaton, Crouse-Hinds Division)

EXHIBIT 344.4 A three-piece (union-type) coupling. (Courtesy of Appleton Electric Co., EGS Electrical Group)

344.56 Splices and Taps. Splices and taps shall be made in accordance with [300.15](#).

344.60 Grounding. RMC shall be permitted as an equipment grounding conductor.

Part III. Construction Specifications

344.100 Construction. RMC shall be made of one of the following:

- (1) Steel with protective coatings
- (2) Aluminum
- (3) Red brass
- (4) Stainless steel

344.120 Marking. Each length shall be clearly and durably identified in every 3 m (10 ft) as required in the first sentence of 110.21(A). Nonferrous conduit of corrosion-resistant material shall have suitable markings.

344.130 Standard Lengths. The standard length of RMC shall be 3.05 m (10 ft), including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

- 348.60 Grounding and Bonding

Part I. General

348.1 Scope. This article covers the use, installation, and construction specifications for flexible metal conduit (FMC) and associated fittings.

348.2 Definition.

Flexible Metal Conduit (FMC). A raceway of circular cross section made of helically wound, formed, interlocked metal strip.

348.6 Listing Requirements. FMC and associated fittings shall be listed.

Part II. Installation

348.10 Uses Permitted. FMC shall be permitted to be used in exposed and concealed locations.

FMC ½ inch and larger may be installed in unlimited lengths, provided an EGC is installed with the circuit conductors.

See also

250.118(5) and 348.60 for specific requirements related to the use of FMC as an EGC

348.12 Uses Not Permitted. FMC shall not be used in the following:

- (1) In wet locations
- (2) In hoistways, other than as permitted in 620.21(A)(1)
- (3) In storage battery rooms
- (4) In any hazardous (classified) location except as permitted by other articles in this Code
- (5) Where exposed to materials having a deteriorating effect on the installed conductors, such as oil or gasoline
- (6) Underground or embedded in poured concrete or aggregate
- (7) Where subject to physical damage

348.20 Size.

(A) Minimum. FMC less than metric designator 16 (trade size ½) shall not be used unless permitted in 348.20(A)(1) through (A)(5) for metric designator 12 (trade size ⅜).

- (1) For enclosing the leads of motors as permitted in 430.245(B)
- (2) In lengths not in excess of 1.8 m (6 ft) for any of the following uses:
 - a. For utilization equipment
 - b. As part of a listed assembly
 - c. For tap connections to luminaires as permitted in 410.117(C)

Trade size ⅜ FMC is permitted to be used as the manufactured or field-installed metal raceway (1½ feet to 6 feet in length) to enclose tap conductors between the outlet box and the terminal housing of recessed luminaires. FMC is also permitted to be used as a 6-foot luminaire whip from an outlet box to a luminaire.

- (3) For manufactured wiring systems as permitted in 604.100(A)

A smaller minimum size for manufactured wiring systems is permitted [see Exception No. 3 to 604.100(A)(2)] because the conductors are not as prone to physical damage where assembled under factory-controlled conditions.

- (4) In hoistways as permitted in 620.21(A)(1)
- (5) As part of a listed assembly to connect wired luminaire sections as permitted in 410.137(C)

(B) Maximum. FMC larger than metric designator 103 (trade size 4) shall not be used.

Informational Note: See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

348.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in **Table 1, Chapter 9**, or as permitted in **Table 348.22**, or for metric designator 12 (trade size $\frac{3}{8}$).

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in **Table 1, Chapter 9**.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and **Table 5** provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following **Chapter 9, Notes to Tables, Note 6**.

To select the proper trade size of FMC, see the appropriate subtable for **Article 348, Flexible Metal Conduit (FMC)**, in **Table 4 of Chapter 9**. If the conductors are of the same wire size and insulation type, **Tables C.3 and C.3(A)** for FMC in **Informative Annex C** can be used instead of performing the calculations.

348.24 Bends — How Made. Bends in conduit shall be made so that the conduit is not damaged and the internal diameter of the conduit is not effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the centerline of any bend shall not be less than shown in **Table 2, Chapter 9** using the column “Other Bends.”

348.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

Proper shaping and support of this flexible wiring method ensures that conductors can be easily installed or withdrawn at any time.

348.28 Trimming. All cut ends shall be trimmed or otherwise finished to remove rough edges, except where fittings that thread into the convolutions are used.

348.30 Securing and Supporting. FMC shall be securely fastened in place and supported in accordance with **348.30(A)** and **(B)**.

(A) Securely Fastened. FMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4½ ft). Where used, cable ties shall be listed and be identified for securement and support.

Listing of cable ties for securement and support of FMC is necessary because the standard requires markings that identify critical performance characteristics. These characteristics can impact their suitability for the conditions of use, including minimum and maximum operating temperature and resistance to ultraviolet light for outdoor installations.

Exception No. 1: Where FMC is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable.

Exception No. 2: Where flexibility is necessary after installation, lengths from the last point where the raceway is securely fastened shall not exceed the following:

- (1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes $\frac{1}{2}$ through $1\frac{1}{4}$)
- (2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes $1\frac{1}{2}$ through 2)
- (3) 1500 mm (5 ft) for metric designators 63 (trade size $2\frac{1}{2}$) and larger

An example of the phrase “where flexibility is necessary after installation” is an installation of FMC to a motor mounted on an adjustable or sliding frame, where the frame is required to be movable to perform drive belt maintenance. The length that the exception addresses is the length from the last point where the FMC is securely fastened.

TABLE 348.22 Maximum Number of Insulated Conductors in Metric Designator 12 (Trade Size $\frac{3}{8}$) Flexible Metal Conduit (FMC)*

Size (AWG)	Types RFH-2, SF-2		Types TF, XHHW, TW		Types TFN, THHN, THWN		Types FEP, FEBP, PF, PGF	
	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit
18	2	3	3	5	5	8	5	8
16	1	2	3	4	4	6	4	6
14	1	2	2	3	3	4	3	4
12	—	—	1	2	2	3	2	3
10	—	—	1	1	1	1	1	2

*In addition, one insulated, covered, or bare equipment grounding conductor of the same size shall be permitted.

Exception No. 3: Lengths not exceeding 1.8 m (6 ft) from a luminaire terminal connection for tap connections to luminaires as permitted in 410.117(C).

Exception No. 4: Lengths not exceeding 1.8 m (6 ft) from the last point where the raceway is securely fastened for connections within an accessible ceiling to a luminaire(s) or other equipment. For the purposes of this exception, listed flexible metal conduit fittings shall be permitted as a means of securement and support.

Securing a raceway may be different than supporting the raceway. Specifying that the listed FMC fitting provides the securement also required by this section clarifies that the listed fitting provides both securement and support of the FMC.

(B) Supports. Horizontal runs of FMC supported by openings through framing members at intervals not greater than 1.4 m (4½ ft) and securely fastened within 300 mm (12 in.) of termination points shall be permitted.

348.42 Couplings and Connectors. Angle connectors shall not be concealed.

348.56 Splices and Taps. Splices and taps shall be made in accordance with 300.15.

348.60 Grounding and Bonding. If used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.

Where flexibility is not required after installation, FMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(5).

Where required or installed, equipment grounding conductors shall be installed in accordance with 250.134(B).

Where required or installed, equipment bonding jumpers shall be installed in accordance with 250.102.

An additional EGC is always required where FMC is used for flexibility. Examples of such installations include using FMC to minimize the transmission of equipment vibration such as motors or to provide flexibility for floodlights, spotlights, or other equipment that require adjustment after installation.

According to ANSI/UL 1, *Standard for Flexible Metal Conduit*, FMC longer than 6 feet has not been judged to be suitable for grounding purposes. If the length of the total ground-fault return path exceeds 6 feet or the circuit overcurrent protection exceeds 20 amperes, a separate EGC must be installed with the circuit conductors according to 250.118(5). The upper figure in Exhibit 348.1 shows an acceptable application of FMC where the total length of any ground return path is limited to 6 feet. The lower figure shows an application that is unacceptable because the grounding return path for Luminaire 2 exceeds the permitted maximum of 6 feet to the box.

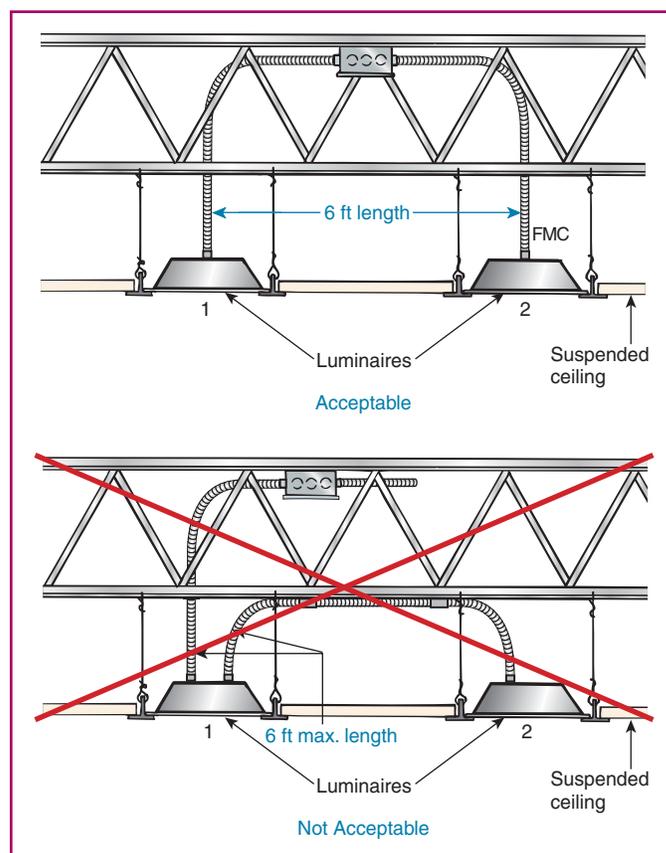

EXHIBIT 348.1 An example of acceptable and unacceptable applications of FMC without separate EGCs used as a luminaire whip, in accordance with 250.118(5)(d).

Where FMC is used in hazardous (classified) locations, a bonding jumper is required. Section 250.102(E) permits the routing of equipment bonding jumpers on the outside of the raceway in lengths that are no longer than 6 feet and bonded at each end.

Part I. General

350.1 Scope. This article covers the use, installation, and construction specifications for liquidtight flexible metal conduit (LFMC) and associated fittings.

Liquidtight flexible metal conduit (LFMC) is intended for use in wet locations or where exposed to oil or coolants, at a maximum temperature of 140°F. LFMC is not intended for use where exposed to gasoline or similar light petroleum solvents unless so marked on the product. If properly marked for the application, LFMC is permitted for direct burial in the earth. LFMC is on the permitted list of wiring methods for services (see 230.43), provided the length does not exceed 6 feet and an equipment bonding jumper is installed in accordance with 250.102. LFMC may be installed in unlimited lengths, provided it meets the other requirements of Article 350 and a separate EGC is installed with the circuit conductors.

350.2 Definition.

Liquidtight Flexible Metal Conduit (LFMC). A raceway of circular cross section having an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible metal core with associated couplings, connectors, and fittings for the installation of electric conductors.

350.6 Listing Requirements. LFMC and associated fittings shall be listed.

Part II. Installation

350.10 Uses Permitted. LFMC shall be permitted to be used in exposed or concealed locations as follows:

- (1) Where conditions of installation, operation, or maintenance require flexibility or protection from liquids, vapors, or solids

- (2) In hazardous (classified) locations where specifically permitted by Chapter 5
- (3) For direct burial where listed and marked for the purpose

350.12 Uses Not Permitted. LFMC shall not be used as follows:

- (1) Where subject to physical damage
- (2) Where any combination of ambient and conductor temperature produces an operating temperature in excess of that for which the material is approved

350.20 Size.

(A) Minimum. LFMC smaller than metric designator 16 (trade size ½) shall not be used.

Exception: LFMC of metric designator 12 (trade size ¾) shall be permitted as covered in 348.20(A).

(B) Maximum. The maximum size of LFMC shall be metric designator 103 (trade size 4).

Informational Note No. 2: See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

350.22 Number of Conductors or Cables.

(A) Metric Designators 16 through 103 (Trade Sizes ½ through 4). The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

(B) Metric Designator 12 (Trade Size ¾). The number of conductors shall not exceed that permitted in Table 348.22, “Fittings Outside Conduit” columns.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following Chapter 9, Notes to Tables, Note 6.

To select the proper trade size of LFMC, see the appropriate subtable for Article 350, Liquidtight Flexible Metal Conduit (LFMC), in Table 4 of Chapter 9. If the conductors are of the same wire size, Tables C.8 and C.8(A) for LFMC in Informative Annex C can be used instead of performing the calculations.

The exception to 350.20(A) permits the use of trade size ¾ LFMC under the limited conditions specified for flexible metal conduit (FMC) in 348.20(A).

See also

Table 348.22 for the number of conductors permitted in trade size ¾ LFMC

350.24 Bends — How Made. Bends in conduit shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Bends shall be permitted to

be made manually without auxiliary equipment. The radius of the curve to the centerline of any bend shall not be less than required in [Table 2, Chapter 9](#) using the column “Other Bends.”

350.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

N 350.28 Trimming. All cut ends of conduit shall be trimmed inside and outside to remove rough edges.

Proper trimming of the cut ends of LFMC is necessary to allow for the proper installation of the steel grounding ferrule, which is required to maintain ground continuity of the steel sheath.

350.30 Securing and Supporting. LFMC shall be securely fastened in place and supported in accordance with [350.30\(A\)](#) and (B).

(A) Securely Fastened. LFMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4½ ft). Where used, cable ties shall be listed and be identified for securement and support.

Listing of cable ties for securement and support of LFMC is necessary because the standard requires markings that identify critical performance characteristics. These characteristics can impact their suitability for the conditions of use, including minimum and maximum operating temperature and resistance to ultraviolet light for outdoor installations.

Exception No. 1: Where LFMC is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical.

Exception No. 2: Where flexibility is necessary after installation, lengths from the last point where the raceway is securely fastened shall not exceed the following:

- (1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes ½ through 1¼)
- (2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes 1½ through 2)
- (3) 1500 mm (5 ft) for metric designators 63 (trade size 2½) and larger

Exception No. 3: Lengths not exceeding 1.8 m (6 ft) from a luminaire terminal connection for tap conductors to luminaires, as permitted in [410.117\(C\)](#).

Exception No. 4: Lengths not exceeding 1.8 m (6 ft) from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) or other equipment. For the purposes of [350.30](#), listed LFMC fittings shall be permitted as a means of securement and support.

Securing LFMC may be different than supporting it. The listed fittings are now recognized to provide the securement as well as the support required by this section.

(B) Supports. Horizontal runs of LFMC supported by openings through framing members at intervals not greater than 1.4 m (4½ ft) and securely fastened within 300 mm (12 in.) of termination points shall be permitted.

350.42 Couplings and Connectors. Only fittings listed for use with LFMC shall be used. Angle connectors shall not be concealed. Straight LFMC fittings shall be permitted for direct burial where marked.

350.56 Splices and Taps. Splices and taps shall be made in accordance with [300.15](#).

350.60 Grounding and Bonding. If used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.

Where flexibility is not required after installation, LFMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with [250.118\(6\)](#).

Where required or installed, equipment grounding conductors shall be installed in accordance with [250.134\(B\)](#).

Where required or installed, equipment bonding jumpers shall be installed in accordance with [250.102](#).

Informational Note: See [501.30\(B\)](#), [502.30\(B\)](#), [503.30\(B\)](#), [505.25\(B\)](#), and [506.25\(B\)](#) for types of equipment grounding conductors.

Part III. Construction Specifications

350.120 Marking. LFMC shall be marked according to [110.21](#). The trade size and other information required by the listing shall also be marked on the conduit. Conduit suitable for direct burial shall be so marked.

352.1 Scope. This article covers the use, installation, and construction specifications for rigid polyvinyl chloride conduit (PVC) and associated fittings.

Informational Note: Refer to [Article 353](#) for High Density Polyethylene Conduit: Type HDPE, and [Article 355](#) for Reinforced Thermosetting Resin Conduit: Type RTRC.

The *UL Guide Information for Electrical Equipment — The White Book* describes rigid PVC conduit, Type PVC, for use in accordance with [Article 352](#). Schedule 40 is suitable where not subject to physical damage for underground, aboveground, indoor, and outdoor locations. Schedule 80 is suitable for the locations where the conduit will be subject to damage. Types A and EB are intended for underground installations.

352.2 Definition.

Rigid Polyvinyl Chloride Conduit (PVC). A rigid nonmetallic raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

352.6 Listing Requirements. PVC conduit, factory elbows, and associated fittings shall be listed.

Part II. Installation

352.10 Uses Permitted. The use of PVC conduit shall be permitted in accordance with [352.10\(A\)](#) through (I).

Informational Note: Extreme cold may cause some nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.

(A) Concealed. PVC conduit shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. PVC conduit shall be permitted in locations subject to severe corrosive influences as covered in [300.6](#) and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. PVC conduit shall be permitted in cinder fill.

(D) Wet Locations. PVC conduit shall be permitted in portions of dairies, laundries, canneries, or other wet locations, and in locations where walls are frequently washed, the entire conduit system, including boxes and fittings used therewith, shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. PVC conduit shall be permitted for use in dry and damp locations not prohibited by [352.12](#).

(F) Exposed. PVC conduit shall be permitted for exposed work. PVC conduit used exposed in areas of physical damage shall be identified for the use

Informational Note: PVC Conduit, Type Schedule 80, is identified for areas of physical damage.

(G) Underground Installations. For underground installations, PVC shall be permitted for direct burial and underground encased in concrete. See [300.5](#) and [300.50](#).

Schedule 40 and Schedule 80 PVC are both permitted for underground installations, such as under driveways, provided that the required burial depth is met.

(H) Support of Conduit Bodies. PVC conduit shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires or other equipment and shall not contain devices other than splicing devices as permitted by [110.14\(B\)](#) and [314.16\(C\)\(2\)](#).

(I) Insulation Temperature Limitations. Conductors or cables rated at a temperature higher than the listed temperature rating of PVC conduit shall be permitted to be installed in PVC conduit, provided the conductors or cables are not operated at a temperature higher than the listed temperature rating of the PVC conduit.

Conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating. One application is the use of 105°C-rated

medium voltage cables, Type MV, where the cable ampacity at the 105°C rating is reduced to the cable ampacity at 75°C or 90°C to match the listed operating temperature rating of the PVC conduit (75°C or 90°C).

352.12 Uses Not Permitted. PVC conduit shall not be used under the conditions specified in 352.12(A) through (E).

(A) Hazardous (Classified) Locations. In any hazardous (classified) location, except as permitted by other articles of this Code.

(B) Support of Luminaires. For the support of luminaires or other equipment not described in 352.10(H).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.

(E) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.

In addition to the conditions in 352.12(A) through (E), PVC conduits are not permitted to be installed in ducts, plenums, and other air-handling spaces.

See also

300.22 for limitations of the use of materials in ducts, plenums, and other air-handling spaces that may contribute smoke and products of combustion during a fire

352.20 Size.

(A) Minimum. PVC conduit smaller than metric designator 16 (trade size ½) shall not be used.

(B) Maximum. PVC conduit larger than metric designator 155 (trade size 6) shall not be used.

Informational Note: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).

352.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following Chapter 9, Notes to Tables, Note 6.

To select the proper trade size of PVC conduit, see the appropriate sub-table for Article 352, Rigid PVC, in Table 4 of Chapter 9. If the conductors are of the same wire size and insulation type, Tables C.10 and C.10(A) through Tables C.13 and C.13(A) can be used instead of performing the calculations provided the appropriate table for the given type of PVC conduit is used.

352.24 Bends — How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with identified bending equipment. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.

Pulling conductors in underground conduit can damage nonmetallic elbows. Metal elbows are often used to ensure the raceway's integrity. Metal elbows in runs of PVC conduit that are buried at least 18 inches are not required to be bonded to the system grounded conductor or the grounding electrode conductor.

See also

250.80 and its commentary for more information on metal elbows in service raceways and enclosures

Chapter 9, Table 2, for the common table for raceway field bend measurements

352.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

The number of bends in a conduit run is limited to reduce pulling tension on the conductors and to help ensure easy insertion or removal of conductors during later phases of construction, when the conduit may be permanently enclosed by the building finish. The NEC® does not limit the pull points to conduit bodies and boxes, which are only examples of pull points.

352.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

352.30 Securing and Supporting. PVC conduit shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. PVC conduit shall be securely fastened and supported in accordance with 352.30(A) and (B).

Expansion fittings and supports, installed as prescribed, allow for expansion/contraction cycles without damage.

See also

352.44 and its commentary for more details on expansion fittings

(A) Securely Fastened. PVC conduit shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.

(B) Supports. PVC conduit shall be supported as required in Table 352.30. Conduit listed for support at spacings other than as shown in Table 352.30 shall be permitted to be installed in accordance with the listing. Horizontal runs of PVC conduit supported by openings through framing members at intervals not exceeding those in Table 352.30 and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

TABLE 352.30 Support of Rigid Polyvinyl Chloride Conduit (PVC)

Conduit Size		Maximum Spacing Between Supports	
Metric Designator	Trade Size	mm or m	ft
16–27	½–1	900 mm	3
35–53	1¼–2	1.5 m	5
63–78	2½–3	1.8 m	6
91–129	3½–5	2.1 m	7
155	6	2.5 m	8

352.44 Expansion Fittings. Expansion fittings for PVC conduit shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with [Table 352.44](#), is expected to be 6 mm (¼ in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

Since PVC conduit exhibits a considerable change in length during a change in temperature, expansion fittings are required for specific temperature variations. According to [Table 352.44](#), a 100-foot run of PVC conduit will change 4.06 inches of length if the temperature change is 100°F.

The allowable range of expansion for many PVC conduit expansion couplings is generally 6 inches. Information concerning installation and application of this type of coupling may be obtained from manufacturers' instructions.

TABLE 352.44 Expansion Characteristics of PVC Rigid Nonmetallic Conduit Coefficient of Thermal Expansion = 6.084×10^{-5} mm/mm/°C (3.38×10^{-5} in./in./°F)

Temperature Change (°C)	Length Change of PVC Conduit (mm/m)	Temperature Change (°F)	Length Change of PVC Conduit (in./100 ft)	Temperature Change (°F)	Length Change of PVC Conduit (in./100 ft)
5	0.30	5	0.20	105	4.26
10	0.61	10	0.41	110	4.46
15	0.91	15	0.61	115	4.66
20	1.22	20	0.81	120	4.87
25	1.52	25	1.01	125	5.07
30	1.83	30	1.22	130	5.27
35	2.13	35	1.42	135	5.48
40	2.43	40	1.62	140	5.68
45	2.74	45	1.83	145	5.88
50	3.04	50	2.03	150	6.08
55	3.35	55	2.23	155	6.29
60	3.65	60	2.43	160	6.49
65	3.95	65	2.64	165	6.69
70	4.26	70	2.84	170	6.90
75	4.56	75	3.04	175	7.10
80	4.87	80	3.24	180	7.30
85	5.17	85	3.45	185	7.50
90	5.48	90	3.65	190	7.71
95	5.78	95	3.85	195	7.91
100	6.08	100	4.06	200	8.11

Expansion fittings are seldom used underground, where temperatures are relatively constant. If PVC conduit is buried or covered immediately, expansion and contraction are not considered a problem.

See also

[300.7\(B\)](#) and its commentary regarding the expansion of PVC

352.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

Informational Note: See [300.4\(G\)](#) for the protection of conductors 4 AWG and larger at bushings.

352.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

352.56 Splices and Taps.

Splices and taps shall be made in accordance with [300.15](#).

352.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in [250.134\(B\)](#), Exception No. 2, for dc circuits and [250.134\(B\)](#), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in [250.142](#).

Part III. Construction Specifications

352.100 Construction. PVC conduit shall be made of rigid (nonplasticized) polyvinyl chloride (PVC). PVC conduit and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above-ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

352.120 Marking. Each length of PVC conduit shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21(A). The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use aboveground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

Informational Note: Examples of these markings include but are not limited to “limited smoke” and “sunlight resistant.”

Part III. Construction Specifications

- 353.100 Construction
- 353.120 Marking

Part I. General

353.1 Scope. This article covers the use, installation, and construction specifications for high density polyethylene (HDPE) conduit and associated fittings.

Informational Note: Refer to Article 352 for Rigid Polyvinyl Chloride Conduit: Type PVC and Article 355 for Reinforced Thermosetting Resin Conduit: Type RTRC.

353.2 Definition.

High Density Polyethylene (HDPE) Conduit. A nonmetallic raceway of circular cross section, with associated couplings, connectors, and fittings for the installation of electrical conductors.

353.6 Listing Requirements. HDPE conduit and associated fittings shall be listed.

Part II. Installation

353.10 Uses Permitted. The use of HDPE conduit shall be permitted under the following conditions:

- (1) In discrete lengths or in continuous lengths from a reel
- (2) In locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the conduit is listed
- (3) In cinder fill
- (4) In direct burial installations in earth or concrete

Informational Note to (4): Refer to 300.5 and 300.50 for underground installations.

- (5) Above ground, except as prohibited in 353.12, where encased in not less than 50 mm (2 in.) of concrete.
- (6) Conductors or cables rated at a temperature higher than the listed temperature rating of HDPE conduit shall be permitted to be installed in HDPE conduit, provided the conductors or cables are not operated at a temperature higher than the listed temperature rating of the HDPE conduit.

Conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating.

One application of 353.10(6) is the use of 105°C-rated medium voltage cables, Type MV, where the cable ampacity at the 105°C rating is reduced to the cable ampacity at 75°C or 90°C to match the listed operating temperature rating of HDPE (75°C or 90°C).

353.12 Uses Not Permitted. HDPE conduit shall not be used under the following conditions:

- (1) Where exposed
- (2) Within a building
- (3) In any hazardous (classified) location, except as permitted by other articles in this *Code*
- (4) Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise

353.20 Size.

(A) Minimum. HDPE conduit smaller than metric designator 16 (trade size ½) shall not be used.

(B) Maximum. HDPE conduit larger than metric designator 155 (trade size 6) shall not be used.

Informational Note: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).

353.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in [Table 1, Chapter 9](#).

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in [Table 1, Chapter 9](#).

[Table 4 of Chapter 9](#) provides the usable area within the selected conduit or tubing, and [Table 5](#) provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following [Chapter 9, Notes to Tables Note 6](#).

To select the proper trade size of HDPE, see the appropriate subtables for [Articles 352 and 353, Rigid PVC Conduit \(PVC\), Schedule 40, and HDPE Conduit in Table 4 of Chapter 9](#). If the conductors are of the same wire size and insulation type, [Tables C.10 and C.10\(A\) in Informative Annex C](#) can be used instead of performing the calculations.

353.24 Bends — How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve to the centerline of such bends shall not be less than shown in [Table 354.24](#). For conduits of metric designators 129 and 155 (trade sizes 5 and 6) the allowable radii of bends shall be in accordance with specifications provided by the manufacturer.

353.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

353.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

353.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the

wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

Informational Note: See [300.4\(G\)](#) for the protection of conductors 4 AWG and larger at bushings.

353.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

Informational Note: HDPE conduit can be joined using either heat fusion, electrofusion, or mechanical fittings.

353.56 Splices and Taps. Splices and taps shall be made in accordance with [300.15](#).

353.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: The equipment grounding conductor shall be permitted to be run separately from the conduit where used for grounding dc circuits as permitted in [250.134](#), Exception No. 2.

Exception No. 2: The equipment grounding conductor shall not be required where the grounded conductor is used to ground equipment as permitted in [250.142](#).

Part III. Construction Specifications

353.100 Construction. HDPE conduit shall be composed of high density polyethylene that is resistant to moisture and chemical atmospheres. The material shall be resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

353.120 Marking. Each length of HDPE shall be clearly and durably marked at least every 3 m (10 ft) as required in [110.21](#). The type of material shall also be included in the marking.

 - (B) Nonmetallic Underground Conduit
 - (C) Conductors and Cables
 - (D) Conductor Fill
- 354.120 Marking

Part I. General

354.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic underground conduit with conductors (NUCC).

NUCC (preassembled conductors in conduit) has been used by electric utilities for outdoor lighting for several years. It is supplied in continuous lengths on coils or reels or in cartons. NUCC consists of nonmetallic conduit with the conductors pre-installed by the manufacturer. The product is designed to allow conductors to be removed and reinserted.

354.2 Definition.

Nonmetallic Underground Conduit with Conductors (NUCC). A factory assembly of conductors or cables inside a nonmetallic, smooth wall raceway with a circular cross section.

354.6 Listing Requirements. NUCC and associated fittings shall be listed.

Part II. Installation

354.10 Uses Permitted. The use of NUCC and fittings shall be permitted in the following:

- (1) For direct burial underground installation (For minimum cover requirements, see [Table 300.5](#) and [Table 300.50](#) under Rigid Nonmetallic Conduit.)
- (2) Encased or embedded in concrete
- (3) In cinder fill
- (4) In underground locations subject to severe corrosive influences as covered in [300.6](#) and where subject to chemicals for which the assembly is specifically approved
- (5) Aboveground, except as prohibited in [354.12](#), where encased in not less than 50 mm (2 in.) of concrete

354.12 Uses Not Permitted. NUCC shall not be used in the following:

- (1) In exposed locations
- (2) Inside buildings

Exception: The conductor or the cable portion of the assembly, where suitable, shall be permitted to extend within the building for termination purposes in accordance with [300.3](#).

- (3) In any hazardous (classified) location, except as permitted by other articles of this *Code*

354.20 Size.

(A) Minimum. NUCC smaller than metric designator 16 (trade size ½) shall not be used.

(B) Maximum. NUCC larger than metric designator 103 (trade size 4) shall not be used.

Informational Note: See [300.1\(C\)](#) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

354.22 Number of Conductors. The number of conductors or cables shall not exceed that permitted by the percentage fill in [Table 1, Chapter 9](#).

354.24 Bends — How Made. Bends shall be manually made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the centerline of such bends shall not be less than shown in [Table 354.24](#)

The bending radius for NUCC does not follow [Chapter 9, Table 2](#), but rather must conform to [Table 354.24](#).

354.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between termination points.

TABLE 354.24 Minimum Bending Radius for Nonmetallic Underground Conduit with Conductors (NUCC)

Conduit Size		Minimum Bending Radius	
Metric Designator	Trade Size	mm	in.
16	½	250	10
21	¾	300	12
27	1	350	14
35	1¼	450	18
41	1½	500	20
53	2	650	26
63	2½	900	36
78	3	1200	48
103	4	1500	60

354.28 Trimming. For termination, the conduit shall be trimmed away from the conductors or cables using an approved method that will not damage the conductor or cable insulation or jacket. All conduit ends shall be trimmed inside and out to remove rough edges.

354.46 Bushings. Where the NUCC enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the conductor or cable from abrasion unless the design of the box, fitting, or enclosure provides equivalent protection.

Informational Note: See 300.4(G) for the protection of conductors size 4 AWG or larger.

354.48 Joints. All joints between conduit, fittings, and boxes shall be made by an approved method.

354.50 Conductor Terminations. All terminations between the conductors or cables and equipment shall be made by an approved method for that type of conductor or cable.

354.56 Splices and Taps. Splices and taps shall be made in junction boxes or other enclosures.

354.60 Grounding. Where equipment grounding is required, an assembly containing a separate equipment grounding conductor shall be used.

Part III. Construction Specifications

354.100 Construction.

(A) General. NUCC is an assembly that is provided in continuous lengths shipped in a coil, reel, or carton.

(B) Nonmetallic Underground Conduit. The nonmetallic underground conduit shall be listed and composed of a material that is resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors.

(C) Conductors and Cables. Conductors and cables used in NUCC shall be listed and shall comply with 310.10(C). Conductors of different systems shall be installed in accordance with 300.3(C).

(D) Conductor Fill. The maximum number of conductors or cables in NUCC shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.

354.120 Marking. NUCC shall be clearly and durably marked at least every 3.05 m (10 ft) as required by 110.21. The type of conduit material shall also be included in the marking.

Identification of conductors or cables used in the assembly shall be provided on a tag attached to each end of the assembly or to the side of a reel. Enclosed conductors or cables shall be marked in accordance with 310.120.

Part III. Construction Specifications

- 355.100 Construction
- 355.120 Marking

Part I. General

355.1 Scope. This article covers the use, installation, and construction specification for reinforced thermosetting resin conduit (RTRC) and associated fittings.

Informational Note: Refer to [Article 352](#) for Rigid Polyvinyl Chloride Conduit: Type PVC, and [Article 353](#) for High Density Polyethylene Conduit: Type HDPE.

355.2 Definition.

Reinforced Thermosetting Resin Conduit (RTRC). A rigid nonmetallic raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

355.6 Listing Requirements. RTRC, factory elbows, and associated fittings shall be listed.

Part II. Installation

355.10 Uses Permitted. The use of RTRC shall be permitted in accordance with [355.10\(A\)](#) through (I).

(A) Concealed. RTRC shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. RTRC shall be permitted in locations subject to severe corrosive influences as covered in [300.6](#) and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. RTRC shall be permitted in cinder fill.

(D) Wet Locations. RTRC shall be permitted in portions of dairies, laundries, canneries, or other wet locations, and in locations where walls are frequently washed, the entire conduit system, including boxes and fittings used therewith, shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. RTRC shall be permitted for use in dry and damp locations not prohibited by [355.12](#).

(F) Exposed. RTRC shall be permitted for exposed work if identified for such use.

Informational Note: RTRC, Type XW, is identified for areas of physical damage.

(G) Underground Installations. For underground installations, see [300.5](#) and [300.50](#).

(H) Support of Conduit Bodies. RTRC shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires or other equipment and shall not contain devices other than splicing devices as permitted by [110.14\(B\)](#) and [314.16\(C\)\(2\)](#).

(I) Insulation Temperature Limitations. Conductors or cables rated at a temperature higher than the listed temperature rating of RTRC conduit shall be permitted to be installed in RTRC conduit,

if the conductors or cables are not operated at a temperature higher than the listed temperature rating of the RTRC conduit.

355.12 Uses Not Permitted. RTRC shall not be used under the following conditions.

(A) Hazardous (Classified) Locations.

- (1) In any hazardous (classified) location, except as permitted by other articles in this *Code*
- (2) In Class I, Division 2 locations, except as permitted in [501.10\(B\)\(1\)\(6\)](#)

(B) Support of Luminaires. For the support of luminaires or other equipment not described in [355.10\(H\)](#).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

RTRC installed in a location where the raceway is subject to physical damage must be marked "XW." If the location is above ground and exposed to physical damage, the conduit must be marked "AG XW RTRC."

See also

[300.50\(C\)](#), [334.15\(B\)](#), [501.10\(B\)\(1\)\(6\)](#), and [551.80\(B\)](#) for examples of requirements specifying the use of RTRC-XW

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.

(E) Theaters and Similar Locations. In theaters and similar locations, except as provided in [518.4](#) and [520.5](#).

In addition to the conditions in [355.12\(A\)](#) through (E), nonmetallic conduits are not permitted to be installed in ducts, plenums, and other air-handling spaces. The use of materials that may contribute smoke and products of combustion during a fire is limited in ducts, plenums, and other air-handling spaces in accordance with [300.22](#).

355.20 Size.

(A) Minimum. RTRC smaller than metric designator 16 (trade size ½) shall not be used.

(B) Maximum. RTRC larger than metric designator 155 (trade size 6) shall not be used.

Informational Note: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See [300.1\(C\)](#).

355.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in [Table 1, Chapter 9](#). Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in [Table 1, Chapter 9](#).

[Table 1](#) of [Chapter 9](#) specifies the maximum percent fill of conduit or tubing. No internal dimensions for Type RTRC are given in the *NEC*® for calculating the allowable number of conductors. Conductor fill calculation may be in accordance with provided dimensions marked on the

conduit. For the exact dimensions for fill calculations of RTRC, refer to the product standard or to the manufacturers' product information.

355.24 Bends — How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with identified bending equipment. The radius of the curve to the centerline of such bends shall not be less than shown in [Table 2, Chapter 9](#).

355.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

The number of bends in a conduit run is limited to reduce pulling tension on conductors and to help ensure easy insertion or removal of conductors during later phases of construction, when the conduit may be permanently enclosed by the building finish. The *NEC* does not limit the pull points to conduit bodies and boxes, which are only examples of pull points.

355.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

355.30 Securing and Supporting. RTRC shall be installed as a complete system in accordance with [300.18](#) and shall be securely fastened in place and supported in accordance with [355.30\(A\)](#) and (B).

(A) Securely Fastened. RTRC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.

(B) Supports. RTRC shall be supported as required in [Table 355.30](#). Conduit listed for support at spacing other than as shown in [Table 355.30](#) shall be permitted to be installed in accordance with the listing. Horizontal runs of RTRC supported by openings through framing members at intervals not exceeding

TABLE 355.30 Support of Reinforced Thermosetting Resin Conduit (RTRC)

Conduit Size		Maximum Spacing Between Supports	
Metric Designator	Trade Size	mm or m	ft
16–27	½–1	900 mm	3
35–53	1¼–2	1.5 m	5
63–78	2½–3	1.8 m	6
91–129	3½–5	2.1 m	7
155	6	2.5 m	8

those in [Table 355.30](#) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

355.44 Expansion Fittings. Expansion fittings for RTRC shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with [Table 355.44](#), is expected to be 6 mm (¼ in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

Since RTRC exhibits a considerable change in length per degree change in temperature, expansion fittings are required for specific variations in temperature. In some areas, outdoor temperature variations of over 100°F are common. According to [Table 355.44](#), a 100-foot run of RTRC will change 1.80 inches in length if the temperature change is 100°F. The allowable range of expansion for many conduit expansion couplings is generally 6 inches. Information concerning installation and application of this type of coupling may be obtained from manufacturers' instructions. Expansion fittings are seldom used underground, where temperatures are relatively constant.

See also

[300.7\(B\)](#) and its commentary regarding the expansion of RTRC

355.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

Informational Note: See [300.4\(G\)](#) for the protection of conductors 4 AWG and larger at bushings.

355.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fitting, and boxes, shall be made by an approved method.

355.56 Splices and Taps Splices and taps shall be made in accordance with [300.15](#).

355.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in [250.134\(B\)](#), Exception No. 2, for dc circuits and [250.134\(B\)](#), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in [250.142](#).

Part III. Construction Specifications

355.100 Construction. RTRC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use aboveground, it shall also be

TABLE 355.44 Expansion Characteristics of Reinforced Thermosetting Resin Conduit (RTRC)
Coefficient of Thermal Expansion = 2.7×10^{-5} mm/mm/°C (1.5×10^{-5} in./in./°F)

100	2.70	100	1.80	200	3.60

flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

355.120 Marking. Each length of RTRC shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21(A). The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use aboveground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

Informational Note: Examples of these markings include but are not limited to “limited smoke” and “sunlight resistant.”

Part I. General

356.1 Scope. This article covers the use, installation, and construction specifications for liquidtight flexible nonmetallic conduit (LFNC) and associated fittings.

LFNC may be prewired as a listed assembly where the conductors are installed at the manufacturing facility in which controlled conditions prevent damage to the conductor insulation. Special cutting tools are required to be used when cutting prewired Type LFNC to prevent nicking the conductor installation. This prewired assembly is shown in **Exhibit 356.1**. LFNC is also used extensively in the machine tool and related industries.

See also

13.5.5 of NFPA 79-2015, *Electrical Standard for Industrial Machinery*, for the uses permitted on an industrial machine.

356.2 Definition.

Liquidtight Flexible Nonmetallic Conduit (LFNC). A raceway of circular cross section of various types as follows:

- (1) A smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and covers, designated as Type LFNC A
- (2) A smooth inner surface with integral reinforcement within the raceway wall, designated as Type LFNC-B
- (3) A corrugated internal and external surface without integral reinforcement within the raceway wall, designated as LFNC-C

Informational Note: FNMC is an alternative designation for LFNC.

356.6 Listing Requirements. LFNC and associated fittings shall be listed.

EXHIBIT 356.1 Listed manufactured prewired assembly of LFNC, Type B. (Courtesy of Thomas and Betts, A Member of the ABB Group)

Part II. Installation

356.10 Uses Permitted. LFNC shall be permitted to be used in exposed or concealed locations for the following purposes:

Informational Note: Extreme cold can cause some types of non-metallic conduits to become brittle and therefore more susceptible to damage from physical contact.

- (1) Where flexibility is required for installation, operation, or maintenance.
- (2) Where protection of the contained conductors is required from vapors, liquids, or solids.
- (3) For outdoor locations where listed and marked as suitable for the purpose.
- (4) For direct burial where listed and marked for the purpose.
- (5) Type LFNC shall be permitted to be installed in lengths longer than 1.8 m (6 ft) where secured in accordance with **356.30**.
- (6) Type LFNC-B as a listed manufactured prewired assembly, metric designator 16 through 27 (trade size ½ through 1) conduit.
- (7) For encasement in concrete where listed for direct burial and installed in compliance with **356.42**.

356.12 Uses Not Permitted. LFNC shall not be used as follows:

- (1) Where subject to physical damage
- (2) Where any combination of ambient and conductor temperatures is in excess of that for which it is listed
- (3) In lengths longer than 1.8 m (6 ft), except as permitted by **356.10(5)** or where a longer length is approved as essential for a required degree of flexibility
- (4) In any hazardous (classified) location, except as permitted by other articles in this *Code*

356.20 Size.

(A) Minimum. LFNC smaller than metric designator 16 (trade size ½) shall not be used unless permitted in **356.20(A)(1)** or **(A)(2)** for metric designator 12 (trade size ¾).

- (1) For enclosing the leads of motors as permitted in **430.245(B)**
- (2) In lengths not exceeding 1.8 m (6 ft) as part of a listed assembly for tap connections to luminaires as required in **410.117(C)**, or for utilization equipment

(B) Maximum. LFNC larger than metric designator 103 (trade size 4) shall not be used.

Informational Note: See **300.1(C)** for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

356.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in **Table 1, Chapter 9**.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in [Table 1, Chapter 9](#).

[Table 4 of Chapter 9](#) provides the usable area within the selected conduit or tubing, and [Table 5](#) provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following [Chapter 9, Notes to Tables, Note 6](#).

To select the proper trade size of LFNC, see the appropriate subtable for [Article 356, Liquidtight Flexible Nonmetallic Conduit \(LFNC-B\)](#), or for [Article 356, Liquidtight Flexible Nonmetallic Conduit \(LFNC-A\)](#), in [Table 4 of Chapter 9](#). If the conductors are of the same wire size and insulation type, [Tables C.5 and C.5\(A\)](#) — or [C.6 and C.6\(A\)](#), for liquidtight flexible nonmetallic conduit (LFNC-B or LFNC-A) — in [Informative Annex C](#) can be used instead of performing the calculations.

356.24 Bends — How Made. Bends in conduit shall be so made that the conduit is not damaged and the internal diameter of the conduit is not effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the centerline of any bend shall not be less than shown in [Table 2, Chapter 9](#) using the column “Other Bends.”

356.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

356.28 Trimming. All cut ends of conduit shall be trimmed inside and outside to remove rough edges.

356.30 Securing and Supporting. Type LFNC shall be securely fastened and supported in accordance with one of the following:

- (1) Where installed in lengths exceeding 1.8 m (6 ft), the conduit shall be securely fastened at intervals not exceeding 900 mm (3 ft) and within 300 mm (12 in.) on each side of every outlet box, junction box, cabinet, or fitting. Where used, cable ties shall be listed as suitable for the application and for securing and supporting.

Listing of cable ties for securement and support of flexible metal conduits is necessary because the standard requires markings that identify critical performance characteristics. These characteristics can impact their suitability for the conditions of use, including minimum and maximum operating temperature and resistance to ultraviolet light for outdoor installations.

- (2) Securing or supporting of the conduit shall not be required where it is fished, installed in lengths not exceeding 900 mm (3 ft) at terminals where flexibility is required, or installed in lengths not exceeding 1.8 m (6 ft) from a luminaire terminal connection for tap conductors to luminaires permitted in [410.117\(C\)](#).
- (3) Horizontal runs of LFNC supported by openings through framing members at intervals not exceeding 900 mm (3 ft)

and securely fastened within 300 mm (12 in.) of termination points shall be permitted.

- (4) Securing or supporting of LFNC shall not be required where installed in lengths not exceeding 1.8 m (6 ft) from the last point where the raceway is securely fastened for connections within an accessible ceiling to a luminaire(s) or other equipment. For the purpose of [356.30](#), listed liquidtight flexible nonmetallic conduit fittings shall be permitted as a means of support.

356.42 Couplings and Connectors. Only fittings listed for use with LFNC shall be used. Angle connectors shall not be used for concealed raceway installations. Straight LFNC fittings are permitted for direct burial or encasement in concrete.

356.56 Splices and Taps. Splices and taps shall be made in accordance with [300.15](#).

356.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in [250.134\(B\)](#), Exception No. 2, for dc circuits and [250.134\(B\)](#), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in [250.142](#).

Part III. Construction Specifications

356.100 Construction. LFNC-B as a prewired manufactured assembly shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.

356.120 Marking. LFNC shall be marked at least every 600 mm (2 ft) in accordance with [110.21](#). The marking shall include a type designation in accordance with [356.2](#) and the trade size. Conduit that is intended for outdoor use or direct burial shall be marked.

The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with [310.120](#).

Part I. General

358.1 Scope. This article covers the use, installation, and construction specifications for electrical metallic tubing (EMT) and associated fittings.

358.2 Definition.

Electrical Metallic Tubing (EMT). An unthreaded thinwall raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed utilizing appropriate fittings.

358.6 Listing Requirements. EMT, factory elbows, and associated fittings shall be listed.

Part II. Installation**358.10 Uses Permitted.**

(A) Exposed and Concealed. The use of EMT shall be permitted for both exposed and concealed work for the following:

- (1) In concrete, in direct contact with the earth or in areas subject to severe corrosive influences where installed in accordance with 358.10(B)
- (2) In dry, damp, and wet locations
- (3) In any hazardous (classified) location as permitted by other articles in this Code

(B) Corrosive Environments.

N (1) Galvanized Steel and Stainless Steel EMT, Elbows, and Fittings. Galvanized steel and stainless steel EMT, elbows, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and approved as suitable for the condition.

N (2) Supplementary Protection of Aluminum EMT. Aluminum EMT shall be provided with approved supplementary corrosion protection where encased in concrete or in direct contact with the earth.

According to the UL Guide Information for Electrical Equipment — The White Book, category FJMX, galvanized steel EMT installed in concrete, on grade or above, generally requires no supplementary corrosion protection. However, galvanized and stainless steel EMT in concrete slab below grade level or in direct contact with earth is required to be protected from corrosion. Where galvanized steel EMT without supplementary corrosion protection extends directly from concrete encasement to soil burial, severe corrosive effects are likely to occur on the metal in contact with the soil.

Other documents, such as the Steel Tube Institute's 2015 *Guidelines for Installing Steel Conduit Tubing*, and ANSI/NECA 101-2006, *Standard for Installing Steel Conduits (Rigid, IMC, EMT)*, should be consulted for approval guidance of corrosion-resistant materials or for requirements prior to the installation of nonferrous metal (aluminum) conduit in concrete, since chloride additives in the concrete mix may cause corrosion.

N (C) Cinder Fill. Galvanized steel and stainless steel EMT shall be permitted to be installed in cinder concrete or cinder fill where subject to permanent moisture when protected on all sides by a layer of noncinder concrete at least 50 mm (2 in.) thick or when the tubing is installed at least 450 mm (18 in.) under the fill.

Although cinder fill is not commonly used in modern construction, it is still encountered at older building sites. Cinders used as fill may contain sulfur, and when they combine with moisture, sulfuric acid is formed, which can corrode metal raceways.

(D) Wet Locations. All supports, bolts, straps, screws, and so forth shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

Informational Note: See 300.6 for protection against corrosion.

358.12 Uses Not Permitted.

EMT shall not be used under the following conditions:

- (1) Where subject to severe physical damage
- (2) For the support of luminaires or other equipment except conduit bodies no larger than the largest trade size of the tubing

N 358.14 Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with galvanized steel EMT,

and galvanized steel fittings and enclosures shall be permitted to be used with aluminum EMT where not subject to severe corrosive influences. Stainless steel EMT shall only be used with stainless steel fittings and approved accessories, outlet boxes, and enclosures.

Aluminum EMT can be used with steel fittings and enclosures, as can aluminum fittings and enclosures with galvanized steel EMT. Tests show that the galvanic corrosion at steel and aluminum interfaces is minor compared to the natural corrosion on the combination of steel and steel or of aluminum and aluminum. Stainless steel, however, can only be used with other stainless steel parts due to the increased possibility of galvanic action with other metals.

358.20 Size.

(A) Minimum. EMT smaller than metric designator 16 (trade size ½) shall not be used.

Exception: For enclosing the leads of motors as permitted in 430.245(B).

(B) Maximum. The maximum size of EMT shall be metric designator 103 (trade size 4).

Informational Note: See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

358.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following Chapter 9, Notes to Tables, Note 6.

To select the proper trade size of EMT, see the appropriate subtable for Article 358, Electrical Metallic Tubing (EMT), in Table 4 of Chapter 9. If the conductors are of the same wire size and insulation type, Tables C.1 and C.1(A) for EMT in Informative Annex C can be used instead of performing the calculations.

358.24 Bends — How Made. Bends shall be made so that the tubing is not damaged and the internal diameter of the tubing

is not effectively reduced. The radius of the curve of any field bend to the centerline of the tubing shall not be less than shown in Table 2, Chapter 9 for one-shot and full shoe benders.

358.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

358.28 Reaming and Threading.

(A) Reaming. All cut ends of EMT shall be reamed or otherwise finished to remove rough edges.

In addition to a reamer, a half-round file has proved practical for removing rough edges. The steel handle of a pair of pump pliers, the nose of side-cutting pliers, or an electrician’s knife can be effective on the smaller sizes of EMT as well.

(B) Threading. EMT shall not be threaded.

Exception: EMT with factory threaded integral couplings complying with 358.100.

358.30 Securing and Supporting. EMT shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 358.30(A) and (B).

(A) Securely Fastened. EMT shall be securely fastened in place at intervals not to exceed 3 m (10 ft). In addition, each EMT run between termination points shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other tubing termination.

Type EMT is required to be “securely fastened” at the prescribed intervals as illustrated in Exhibit 358.1.

See also
344.30(A) and its commentary for more information on secure fastening

Exception No. 1: Fastening of unbroken lengths shall be permitted to be increased to a distance of 1.5 m (5 ft) where structural members do not readily permit fastening within 900 mm (3 ft).

As illustrated in Exhibit 358.2, boxes are permitted to be secured to ceiling or roof support structural members that are spaced not more than 5 feet apart to serve as support for runs of EMT perpendicular to the axis of the ceiling or roof support members.

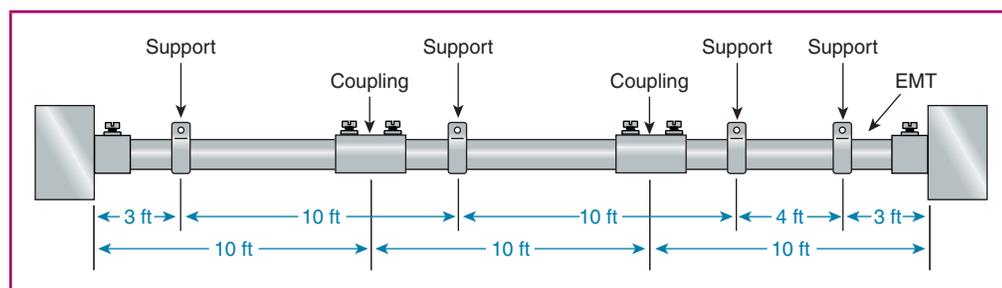

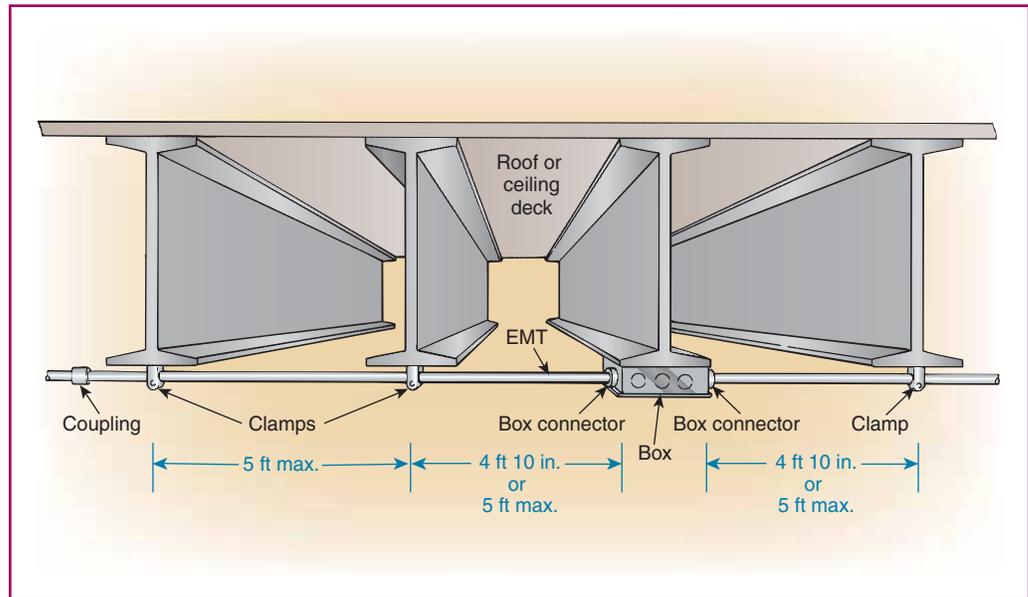

EXHIBIT 358.1 Minimum requirements for securely fastening EMT unless an exception applies.

EXHIBIT 358.2 An EMT installation in which the fastening spacing is increased to a maximum of 5 feet.

Exception No. 2: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths (without coupling) of EMT shall be permitted to be fished.

(B) Supports. Horizontal runs of EMT supported by openings through framing members at intervals not greater than 3 m (10 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Horizontal runs of EMT are permitted to be supported (but not necessarily secured) by framing members at 10 foot intervals, provided the EMT is secured at least 3 feet from the box or enclosure. See [Exhibit 342.2](#) in the commentary following [342.30\(B\)\(4\)](#) for an example.

358.42 Couplings and Connectors. Couplings and connectors used with EMT shall be made up tight. Where buried in masonry or concrete, they shall be concretetight type. Where installed in wet locations, they shall comply with [314.15](#).

Only listed fittings are permitted per [358.6](#), and [314.15](#) specifically requires that fittings for use in wet locations be listed for such use. According to ANSI/UL 797, *Electrical Metallic Tubing — Steel*, listed fittings suitable for use in poured concrete or where exposed to rain are indicated on the fitting or carton. The term *concretetight* or equivalent on the carton indicates suitability for use in poured concrete. The term *raintight* or the equivalent on the carton indicates suitability for use where directly exposed to rain.

See also

[225.22](#) and [230.54\(A\)](#) for raintight requirements as applied to raceways on exterior surfaces of buildings and to service raceways

Indentor-type fittings, utilized only with metallic-coated EMT, require a special tool supplied by the manufacturer for proper installation. Fittings are tested for use only with steel EMT, unless specific marking on the device or carton indicates the fittings are suitable for use with aluminum or other material.

358.56 Splices and Taps. Splices and taps shall be made in accordance with [300.15](#).

358.60 Grounding. EMT shall be permitted as an equipment grounding conductor.

Part III. Construction Specifications

358.100 Construction. EMT shall be made of one of the following:

- (1) Steel with protective coatings
- (2) Aluminum
- (3) Stainless steel

358.120 Marking. EMT shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of [110.21\(A\)](#).

360.24	Bends. (A) Infrequent Flexing Use. (B) Fixed Bends.
360.56	Splices and Taps.
360.60	Grounding.
Part III. Construction Specifications	
360.120	Marking.

Part I. General

360.1 Scope. This article covers the use, installation, and construction specifications for flexible metallic tubing (FMT) and associated fittings.

FMT is a type of raceway used for certain specific applications, particularly under the requirements of 300.22(B) and (C) for wiring in ducts and other air-handling spaces. Initially intended for use in these locations, FMT is an effective barrier to the gases and products of combustion. It is very flexible and rarely affected by vibration or other movement.

360.2 Definition.

Flexible Metallic Tubing (FMT). A metal raceway that is circular in cross section, flexible, and liquidtight without a non-metallic jacket.

360.6 Listing Requirements. FMT and associated fittings shall be listed.

Part II. Installation

360.10 Uses Permitted. FMT shall be permitted to be used for branch circuits as follows:

- (1) In dry locations
- (2) Where concealed
- (3) In accessible locations
- (4) For system voltages of 1000 volts maximum

The 1000-volt limitation prohibits the use of FMT for the secondary circuits of sign ballasts, sign transformers, electronic sign power supplies, or oil burner ignition transformers unless these circuits are less than 1000 volts.

360.12 Uses Not Permitted.

FMT shall not be used as follows:

- (1) In hoistways
- (2) In storage battery rooms
- (3) In hazardous (classified) locations unless otherwise permitted under other articles in this Code

- (4) Underground for direct earth burial, or embedded in poured concrete or aggregate
- (5) Where subject to physical damage
- (6) In lengths over 1.8 m (6 ft)

360.20 Size.

(A) Minimum. FMT smaller than metric designator 16 (trade size $\frac{1}{2}$) shall not be used.

Exception No. 1: FMT of metric designator 12 (trade size $\frac{3}{8}$) shall be permitted to be installed in accordance with 300.22(B) and (C).

Exception No. 2: FMT of metric designator 12 (trade size $\frac{3}{8}$) shall be permitted in lengths not in excess of 1.8 m (6 ft) as part of a listed assembly or for luminaires. See 410.117(C).

(B) Maximum. The maximum size of FMT shall be metric designator 21 (trade size $\frac{3}{4}$).

Informational Note: See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

360.22 Number of Conductors.

(A) FMT — Metric Designators 16 and 21 (Trade Sizes $\frac{1}{2}$ and $\frac{3}{4}$). The number of conductors in metric designators 16 (trade size $\frac{1}{2}$) and 21 (trade size $\frac{3}{4}$) shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following Chapter 9, Notes to Tables, Note 6.

To select the proper trade size of FMT, see the appropriate subtable for Article 348, Flexible Metal Conduit (FMC), in Table 4 of Chapter 9. If the conductors are of the same wire size and insulation type, Tables C.3 and C.3(A) for FMT sizes $\frac{1}{2}$ inch and $\frac{3}{4}$ inch in Informative Annex C can be used instead of performing the calculations.

(B) FMT — Metric Designator 12 (Trade Size $\frac{3}{8}$). The number of conductors in metric designator 12 (trade size $\frac{3}{8}$) shall not exceed that permitted in Table 348.22.

360.24 Bends.

(A) Infrequent Flexing Use. When FMT is infrequently flexed in service after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 360.24(A).

(B) Fixed Bends. Where FMT is bent for installation purposes and is not flexed or bent as required by use after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 360.24(B).

TABLE 360.24(A) Minimum Radii for Flexing Use

Metric Designator	Trade Size	Minimum Radii for Flexing Use	
		mm	in.
12	3/8	254.0	10
16	1/2	317.5	12½
21	3/4	444.5	17½

TABLE 360.24(B) Minimum Radii for Fixed Bends

Metric Designator	Trade Size	Minimum Radii for Fixed Bends	
		mm	in.
12	3/8	88.9	3½
16	1/2	101.6	4
21	3/4	127.0	5

360.56 Splices and Taps. Splices and taps shall be made in accordance with 300.15.

360.60 Grounding. FMT shall be permitted as an equipment grounding conductor where installed in accordance with 250.118(7).

Part III. Construction Specifications

360.120 Marking. FMT shall be marked according to 110.21.

- 362.120 Marking

Part I. General

362.1 Scope. This article covers the use, installation, and construction specifications for electrical nonmetallic tubing (ENT) and associated fittings.

ENT is made of the same material used for PVC conduit. The outside diameters of ENT (½-inch through 2-inch trade sizes only) are such that standard couplings and other fittings for rigid PVC conduit can be used.

Because of the corrugations, the raceway can be bent by hand and has some degree of flexibility. ENT is not intended for use where flexibility is necessary, such as at motor terminations to prevent transmission of noise and vibration, or for connection of adjustable luminaires or moving parts. ENT is suitable for the installation of conductors having a temperature rating as indicated on the product. The maximum allowable ambient temperature is 122°F. Exhibit 362.1 shows an example of ENT.

362.2 Definition.

Electrical Nonmetallic Tubing (ENT). A nonmetallic, pliable, corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings for the installation of electrical conductors. ENT is composed of a material that is resistant to moisture and chemical atmospheres and is flame retardant.

A pliable raceway is a raceway that can be bent by hand with a reasonable force but without other assistance.

362.6 Listing Requirements. ENT and associated fittings shall be listed.

EXHIBIT 362.1 Various sizes of ENT suitable for use. (Courtesy of Thomas and Betts, A Member of the ABB Group)

Part II. Installation

362.10 Uses Permitted. For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted. The use of ENT and fittings shall be permitted in the following:

- (1) In any building not exceeding three floors above grade as follows:
 - a. For exposed work, where not prohibited by 362.12
 - b. Concealed within walls, floors, and ceilings

Where exposed and subject to physical damage, ENT is required to be protected and is limited to use in buildings not exceeding three floors above grade. Where concealed or above a suspended ceiling (exposed), ENT is permitted to be installed within walls, floors, or ceilings in buildings of three floors or less without the need for fire-rated construction. The three-floor limitation is based on the likelihood that only a small quantity of ENT would be exposed to fire and that the occupants would have adequate time to exit the building before the products of combustion make the building untenable. Exhibit 362.2 illustrates permitted uses of ENT in a building of three floors or less.

- (2) In any building exceeding three floors above grade, ENT shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute-finish-rated

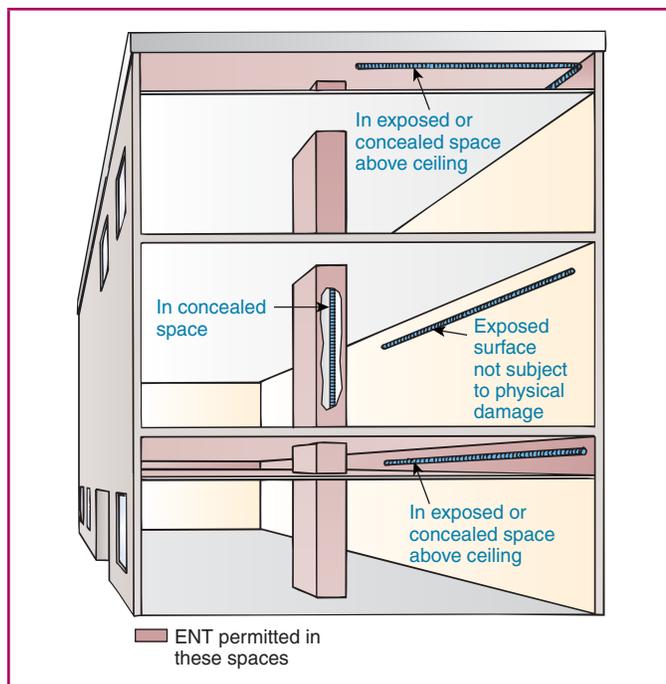

EXHIBIT 362.2 Examples of permitted uses of ENT in a building not exceeding three floors.

thermal barrier shall be permitted to be used for combustible or noncombustible walls, floors, and ceilings.

Exception to (2): Where a fire sprinkler system(s) is installed in accordance with NFPA 13-2013, Standard for the Installation of Sprinkler Systems, on all floors, ENT shall be permitted to be used within walls, floors, and ceilings, exposed or concealed, in buildings exceeding three floors above grade.

Informational Note: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

ENT is permitted to be installed within the walls, floors, or ceilings of a building of any height where the walls, floors, or ceilings provide a thermal barrier of material that has at least a 15-minute finish rating. Exposed ENT in the first three floors of a building that exceeds three floors is not permitted or intended except as permitted in 362.10(5). Where installed in a building over three floors, ENT must be installed behind the 15-minute thermal barrier on all floors. Exhibit 362.3 illustrates areas permitted to use

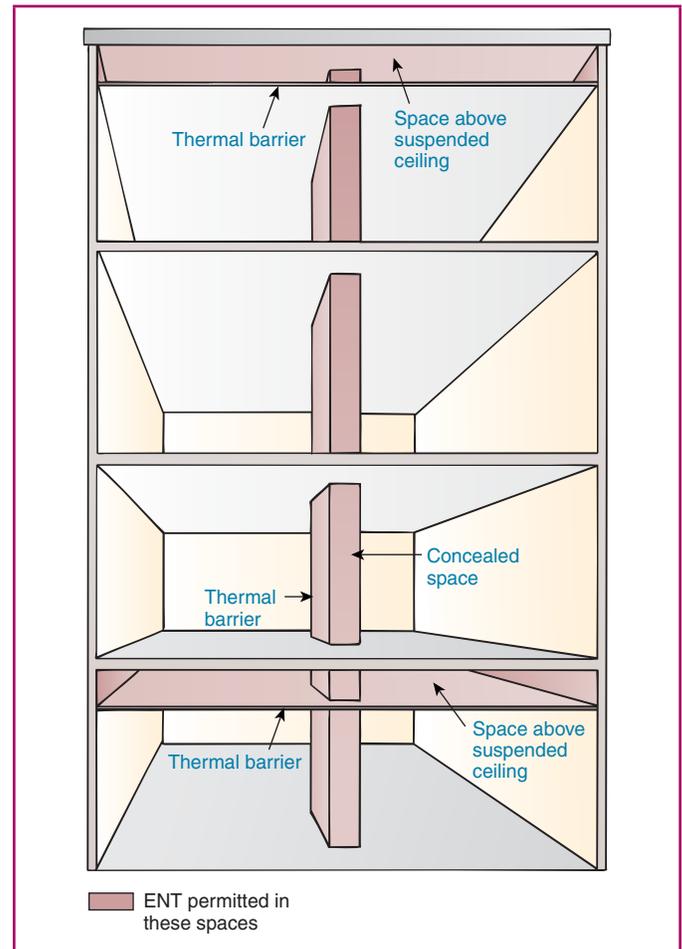

EXHIBIT 362.3 Examples of permitted uses of ENT in a building exceeding three floors.

ENT in a building exceeding three floors. In accordance with the exception, fire sprinkler systems can also be used as a construction condition under which an expanded use of ENT is allowed.

Interior finish is generally considered to consist of those materials or combinations of materials that form the exposed interior surface of walls and ceilings in a building. Common interior finish materials include plaster, gypsum wallboard, wood, plywood paneling, fibrous ceiling tiles, and a variety of wall coverings. Ordinary paint, wallpaper, or other similar wall coverings not exceeding $\frac{1}{8}$ inch in thickness are generally considered incidental to interior finish, except where the AHJ deems them a hazard.

The finish rating of a wall or ceiling finish material is the time required for the unexposed surface of the finish membrane to reach an average temperature rise of 250°F above ambient or an individual temperature rise at any one point not exceeding 325°F when the assembly is tested in accordance with ANSI/UL 263, *Standard for Fire Tests of Building Construction and Materials*, or ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*.

The finish rating of wall and ceiling finish materials tested and rated by UL as part of wall and ceiling assemblies can be found in the *UL Fire Resistance Directory*, immediately following the assembly rating and just below the design number. Only assemblies containing combustible support members, however, have published finish ratings. Obviously, limiting ENT to constructions consisting of combustible support members is not the intent. This section is intended to provide a 15-minute thermal barrier as a minimum threshold of acceptability.

Commentary Table 362.1, reproduced from the NFPA *Fire Protection Handbook*, 20th edition (Volume 2, Section 19, **Chapter 2**, Table 19.2.13), provides ratings for common finish materials. If the finish rating concealing the ENT is unknown or is less than 15 minutes, the ENT can still be used if the installation meets the criteria in **362.10**, including the three-floor limitation, where required, and the installation is not prohibited by **362.12**. For finish materials not tested and rated in the *UL Fire Resistance Directory*, use **Commentary Table 362.1**.

See also

10.2.1 of NFPA 101®, *Life Safety Code*®, for more information regarding classification of interior finish material

- (3) In locations subject to severe corrosive influences as covered in **300.6** and where subject to chemicals for which the materials are specifically approved.
- (4) In concealed, dry, and damp locations not prohibited by **362.12**.
- (5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in **362.10(1)a**.

Exception to (5): ENT shall be permitted to be used above suspended ceilings in buildings exceeding three floors above grade where the building is protected throughout by a fire sprinkler system installed in accordance with NFPA 13-2013, Standard for the Installation of Sprinkler Systems.

- (6) Encased in poured concrete, or embedded in a concrete slab on grade where ENT is placed on sand or approved screenings, provided fittings identified for this purpose are used for connections.

Gypsum-sand plaster, 1:2, 1:3, $\frac{3}{4}$ in. thick, on paper-backed metal lath	20

Note: For SI units, 1 in. = 25.4 mm.

^aFrom National Institute for Standards and Technology, BMS-92.

^bUnsanded wood-fiber plaster.

- (7) For wet locations indoors as permitted in this section or in a concrete slab on or belowgrade, with fittings listed for the purpose.
- (8) Metric designator 16 through 27 (trade size $\frac{1}{2}$ through 1) as listed manufactured prewired assembly.

Informational Note: Extreme cold may cause some types of nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.

Prewired ENT is a listed assembly whose conductors must be installed at the manufacturing facility, where controlled conditions prevent damage to the conductor insulation. Special tools are required when cutting prewired ENT to prevent nicking of the conductor insulation.

- (9) Conductors or cables rated at a temperature higher than the listed temperature rating of ENT shall be permitted to be installed in ENT, if the conductors or cables are not

operated at a temperature higher than the listed temperature rating of the ENT.

Conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating.

362.12 Uses Not Permitted. ENT shall not be used in the following:

- (1) In any hazardous (classified) location, except as permitted by other articles in this *Code*
- (2) For the support of luminaires and other equipment
- (3) Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise
- (4) For direct earth burial
- (5) In exposed locations, except as permitted by 362.10(1), 362.10(5), and 362.10(7)
- (6) In theaters and similar locations, except as provided in 518.4 and 520.5
- (7) Where exposed to the direct rays of the sun, unless identified as sunlight resistant
- (8) Where subject to physical damage

362.20 Size.

(A) Minimum. ENT smaller than metric designator 16 (trade size ½) shall not be used.

(B) Maximum. ENT larger than metric designator 63 (trade size 2½) shall not be used.

Informational Note See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

362.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 provides the required area for each conductor. Examples using these tables to calculate a conduit or tubing size are provided in the commentary following Chapter 9, Notes to Tables, Note 6.

To select the proper trade size of ENT, see the appropriate subtable for Article 362, Electrical Nonmetallic Tubing (ENT), in Table 4 of Chapter 9. If the conductors are of the same wire size and insulation type, Tables C.2 and C.2(A) for ENT in Informative Annex C can be used instead of performing the calculations.

362.24 Bends — How Made. Bends shall be so made that the tubing will not be damaged and the internal diameter of the tubing will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius

of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9 using the column “Other Bends.”

362.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

362.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

362.30 Securing and Supporting. ENT shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place by an approved means and supported in accordance with 362.30(A) and (B).

(A) Securely Fastened. ENT shall be securely fastened at intervals not exceeding 900 mm (3 ft). In addition, ENT shall be securely fastened in place within 900 mm (3 ft) of each outlet box, device box, junction box, cabinet, or fitting where it terminates. Where used, cable ties shall be listed as suitable for the application and for securing and supporting.

Exception No. 1: Lengths not exceeding a distance of 1.8 m (6 ft) from a luminaire terminal connection for tap connections to lighting luminaires shall be permitted without being secured.

Exception No. 2: Lengths not exceeding 1.8 m (6 ft) from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) or other equipment.

Exception No. 3: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths (without coupling) of ENT shall be permitted to be fished.

As illustrated in Exhibit 362.4, where run on the surface of framing members, ENT is required to be fastened to the framing member every 3 feet and within 3 feet of every box.

As illustrated in Exhibit 362.5, ENT is permitted by Exception No. 1 to be used as luminaire whip without support for lengths not exceeding 6 feet.

See also

300.4(D) for requirements for protection against physical damage
410.117(C) for details on tap conductor wiring

(B) Supports. Horizontal runs of ENT supported by openings in framing members at intervals not exceeding 900 mm (3 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

362.46 Bushings. Where a tubing enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

Informational Note See 300.4(G) for the protection of conductors size 4 AWG or larger.

362.48 Joints. All joints between lengths of tubing and between tubing and couplings, fittings, and boxes shall be by an approved method.

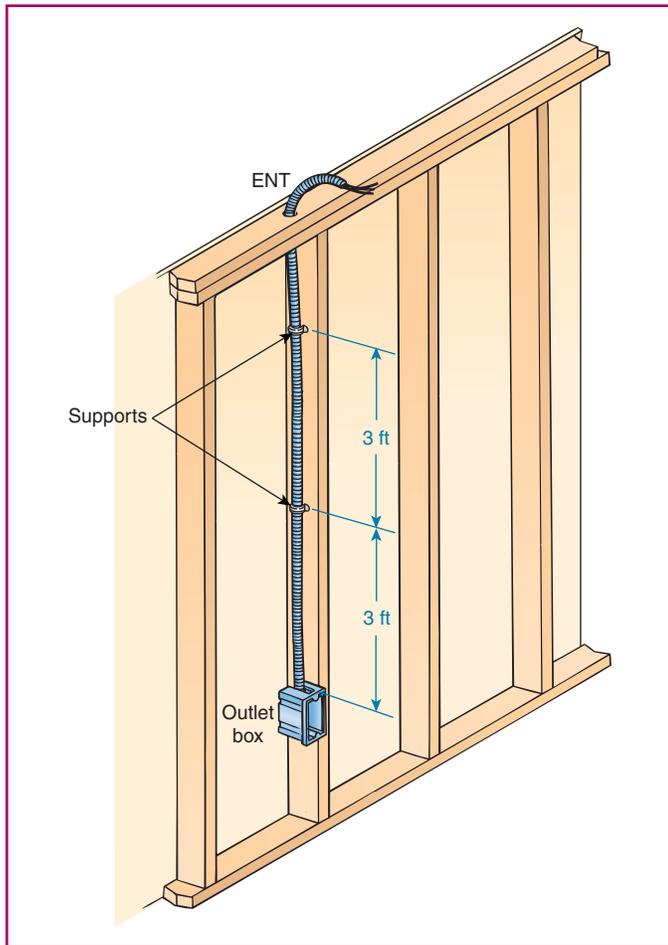

EXHIBIT 362.4 An example showing EMT supported every 3 feet and within 3 feet of the outlet box.

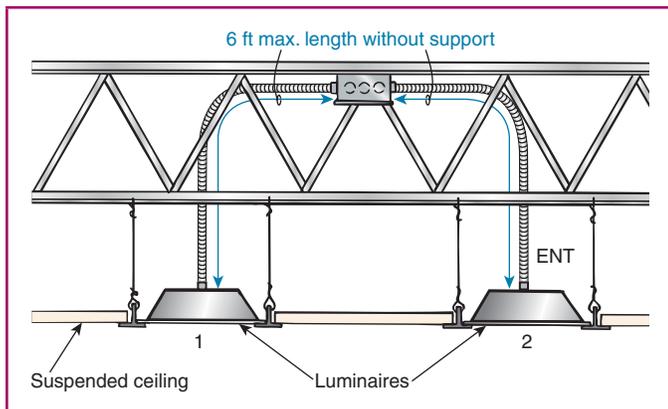

EXHIBIT 362.5 An example showing two unsupported lengths of EMT, each permitted to be installed in a length not to exceed 6 feet.

362.56 Splices and Taps. Splices and taps shall be made only in accordance with 300.15.

Informational Note: See Article 314 for rules on the installation and use of boxes and conduit bodies.

362.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the raceway in compliance with Article 250, Part VI.

Part III. Construction Specifications

362.100 Construction. EMT shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride.

EMT, as a prewired manufactured assembly, shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.

362.120 Marking. EMT shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21(A). The type of material shall also be included in the marking. Marking for limited smoke shall be permitted on the tubing that has limited smoke-producing characteristics.

The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with 310.120.

Part I. General

366.1 Scope. This article covers the use, installation, and construction requirements of metal auxiliary gutters and nonmetallic auxiliary gutters and associated fittings.

An auxiliary gutter provides additional gutter space for wiring in various types of electrical enclosures and equipment. This additional gutter space may be necessary to provide sufficient room for the number of conductors in an enclosure or to provide adequate wiring bending/deflection space where conductors connect to a terminal. Although the construction of an auxiliary gutter is no different from that of a wireway, the field application of this equipment differentiates an auxiliary gutter from a wireway.

A wireway is a raceway in accordance with the definition of raceway in Article 100. Auxiliary gutters supplement enclosure wiring spaces and are not encompassed by the definition of raceway. Therefore, NEC® requirements that apply only to raceways do not apply to auxiliary gutters. An example of such a requirement is 230.7, which prohibits service conductors from being installed in a raceway with conductors that are not service conductors. This rule applies to wireways installed in accordance with Articles 376 and 378. However, an auxiliary gutter installed to supplement the wiring space of a service equipment enclosure is not a wireway and, therefore, is not subject to 230.7.

366.2 Definitions.

Metal Auxiliary Gutter. A sheet metal enclosure used to supplement wiring spaces at meter centers, distribution centers, switchgear, switchboards, and similar points of wiring systems. The enclosure has hinged or removable covers for housing and protecting electrical wires, cable, and busbars. The enclosure is designed for conductors to be laid or set in place after the enclosures have been installed as a complete system.

Nonmetallic Auxiliary Gutter. A flame-retardant, nonmetallic enclosure used to supplement wiring spaces at meter centers,

distribution centers, switchgear, switchboards, and similar points of wiring systems. The enclosure has hinged or removable covers for housing and protecting electrical wires, cable, and busbars. The enclosure is designed for conductors to be laid or set in place after the enclosures have been installed as a complete system.

366.6 Listing Requirements.

(A) Outdoors. Nonmetallic auxiliary gutters installed outdoors shall be listed for all of the following conditions:

- (1) Exposure to sunlight
- (2) Use in wet locations
- (3) Maximum ambient temperature of the installation

(B) Indoors. Nonmetallic auxiliary gutters installed indoors shall be listed for the maximum ambient temperature of the installation.

The sections and associated fittings of auxiliary gutters are identical to those of wireways. They differ only in their intended use. If listed, these may be marked as "Wireway," "Auxiliary Gutter," or "Wireway or Auxiliary Gutter" depending on the intended application.

See also

366.1 and its commentary for a further understanding of auxiliary gutters

376.1 and its commentary for a comparative discussion on metal wireways

Part II. Installation

366.10 Uses Permitted.

(A) Sheet Metal Auxiliary Gutters

(1) Indoor and Outdoor Use. Sheet metal auxiliary gutters shall be permitted for indoor and outdoor use.

(2) Wet Locations. Sheet metal auxiliary gutters installed in wet locations shall be suitable for such locations.

(B) Nonmetallic Auxiliary Gutters. Nonmetallic auxiliary gutters shall be listed for the maximum ambient temperature of the installation and marked for the installed conductor insulation temperature rating.

Informational Note: Extreme cold may cause nonmetallic auxiliary gutters to become brittle and therefore more susceptible to damage from physical contact.

(1) Outdoors. Nonmetallic auxiliary gutters shall be permitted to be installed outdoors where listed and marked as suitable for the purpose.

(2) Indoors. Nonmetallic auxiliary gutters shall be permitted to be installed indoors.

366.12 Uses Not Permitted.

- Auxiliary gutters shall not be used:
- (1) To enclose switches, overcurrent devices, appliances, or other similar equipment
 - (2) To extend a greater distance than 9 m (30 ft) beyond the equipment that it supplements

Exception: As permitted in 620.35 for elevators, an auxiliary gutter shall be permitted to extend a distance greater than 9 m (30 ft) beyond the equipment it supplements.

Informational Note: For wireways, see Articles 376 and 378. For busways, see Article 368.

N 366.20 Conductors Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.10(H), the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Conductors connected in parallel in auxiliary gutters must be installed in groups, with each group consisting of a single conductor from each phase and one from the neutral or ground. Proper grouping of phases can reduce inductive heating and result in a more balanced load between conductors within the same phase group.

366.22 Number of Conductors.

No limit is placed on the size of conductors that may be installed in an auxiliary gutter. The dimensions of insulated conductors, found in Tables 5 and 5A of Chapter 9, can be used to calculate the size of auxiliary gutters.

See also

376.22 commentary for an example for calculating the size of a wireway, which is also applicable to auxiliary gutters

(A) Sheet Metal Auxiliary Gutters. The sum of the cross-sectional areas of all contained conductors and cables at any cross section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter. The adjustment factors in 310.15(B)(3)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(5), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

Where sheet metal auxiliary gutters contain 30 or fewer current-carrying conductors, the correction factors in 310.15(B)(2) do not apply. However, if more than 30 conductors are installed in the same cross-sectional area of a sheet metal auxiliary gutter, the ampacity adjustment factors of 310.15(B)(3)(a) apply, and the number of current-carrying conductors is not limited up to the 20-percent fill.

See also

366.23(A) for ampacity limitations of bare copper or aluminum busbars enclosed in gutters

(B) Nonmetallic Auxiliary Gutters. The sum of cross-sectional areas of all contained conductors and cables at any cross section of the nonmetallic auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic auxiliary gutter.

The requirements for nonmetallic auxiliary gutters limit the cross-sectional area of all conductors to 20 percent. There is no 30-conductor allowance. The derating factors specified in 310.15(B)(3)(a) must be applied as stated in 366.23(B).

366.23 Ampacity of Conductors.

(A) Sheet Metal Auxiliary Gutters. Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the adjustment factors specified in 310.15(B)(3)(a) shall not apply. The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes/mm² (1000 amperes/in.²) of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/mm² (700 amperes/in.²) of cross section of the conductor.

(B) Nonmetallic Auxiliary Gutters. The adjustment factors specified in 310.15(B)(3)(a) shall be applicable to the current-carrying conductors in the nonmetallic auxiliary gutter.

366.30 Securing and Supporting.

(A) Sheet Metal Auxiliary Gutters. Sheet metal auxiliary gutters shall be supported and secured throughout their entire length at intervals not exceeding 1.5 m (5 ft).

(B) Nonmetallic Auxiliary Gutters. Nonmetallic auxiliary gutters shall be supported and secured at intervals not to exceed 900 mm (3 ft) and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 m (10 ft).

366.44 Expansion Fittings. Expansion fittings shall be installed where expected length change, due to expansion and contraction due to temperature change, is more than 6 mm (0.25 in.).

Both metal and nonmetallic gutters must have expansion fittings where temperature fluctuations are expected to change gutter length more than ¼ inch.

See also

Table 352.44 for expansion characteristics of nonmetallic gutters similar to those of PVC conduit

300.7(B) commentary for more on expansion fittings

366.56 Splices and Taps. Splices and taps shall comply with 366.56(A) through (D).

(A) Within Gutters. Splices or taps shall be permitted within gutters where they are accessible by means of removable covers or doors. The conductors, including splices and taps, shall not fill the gutter to more than 75 percent of its area.

(B) Bare Conductors. Taps from bare conductors shall leave the gutter opposite their terminal connections, and conductors shall not be brought in contact with uninsulated current-carrying parts of different voltages.

(C) Suitably Identified. All taps shall be suitably identified at the gutter as to the circuit or equipment that they supply.

(D) Overcurrent Protection. Tap connections from conductors in auxiliary gutters shall be provided with overcurrent protection as required in 240.21.

366.58 Insulated Conductors.

(A) Deflected Insulated Conductors. Where insulated conductors are deflected within an auxiliary gutter, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the gutter, or where the direction of the gutter is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 312.6(A) shall apply.

(B) Auxiliary Gutters Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through an auxiliary gutter, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required in 314.28(A)(1) for straight pulls and 314.28(A)(2) for angle pulls.

366.60 Grounding. Metal auxiliary gutters shall be connected to an equipment grounding conductor(s), to an equipment bonding jumper, or to the grounded conductor where permitted or required by 250.92(B)(1) or 250.142.

Part III. Construction Specifications

366.100 Construction.

(A) Electrical and Mechanical Continuity. Gutters shall be constructed and installed so that adequate electrical and mechanical continuity of the complete system is secured.

(B) Substantial Construction. Gutters shall be of substantial construction and shall provide a complete enclosure for the contained conductors. All surfaces, both interior and exterior, shall be suitably protected from corrosion. Corner joints shall be made tight, and where the assembly is held together by rivets, bolts, or screws, such fasteners shall be spaced not more than 300 mm (12 in.) apart.

(C) Smooth Rounded Edges. Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors pass between gutters, through partitions, around bends, between gutters and cabinets or junction boxes, and at other locations where necessary to prevent abrasion of the insulation of the conductors.

(D) Covers. Covers shall be securely fastened to the gutter.

(E) Clearance of Bare Live Parts. Bare conductors shall be securely and rigidly supported so that the minimum clearance between bare current-carrying metal parts of different voltages mounted on the same surface will not be less than 50 mm (2 in.), nor less than 25 mm (1 in.) for parts that are held free in the air. A clearance not less than 25 mm (1 in.) shall be secured between bare current-carrying metal parts and any metal surface. Adequate provisions shall be made for the expansion and contraction of busbars.

366.120 Marking.

(A) Outdoors. Nonmetallic auxiliary gutters installed outdoors shall have the following markings:

- (1) Suitable for exposure to sunlight
- (2) Suitable for use in wet locations
- (3) Installed conductor insulation temperature rating

(B) Indoors. Nonmetallic auxiliary gutters installed indoors shall be marked with the installed conductor insulation temperature rating.

Part I. General Requirements

368.1 Scope. This article covers service-entrance, feeder, and branch-circuit busways and associated fittings.

Exhibit 368.1 illustrates a typical busway covered in this article. See also **Exhibit 100.1**.

368.2 Definition.

Busway. A raceway consisting of a metal enclosure containing factory-mounted, bare or insulated conductors, which are usually copper or aluminum bars, rods, or tubes.

Informational Note: For cablebus, refer to **Article 370**.

Four busway designs are available:

1. A lighting busway, with a maximum current rating of 50 amperes, supplies and supports industrial and commercial luminaires.
2. A trolley busway allows continuous contact with a trolley through a slot in the enclosure and may also be marked as "Lighting Busway" if intended for use with industrial and commercial luminaires.
3. A continuous plug-in busway allows for the insertion of plug-in devices at any point along its length. This busway, limited to a maximum current rating of 225 amperes, is intended for general use and may be installed within reach of persons.
4. A short-run busway is intended primarily to feed switchboards and is limited to a run of 30 feet horizontal or 10 feet vertical.

Part II. Installation

368.10 Uses Permitted. Busways shall be permitted to be installed where they are located in accordance with **368.10(A)** through (C).

Informational Note: See **300.21** for information concerning the spread of fire or products of combustion.

(A) Exposed. Busways shall be permitted to be located in the open where visible, except as permitted in **368.10(C)**.

(B) Behind Access Panels. Busways shall be permitted to be installed behind access panels, provided the busways are totally enclosed, of nonventilating-type construction, and installed so that the joints between sections and at fittings are accessible for maintenance purposes. Where installed behind access panels, means of access shall be provided, and either of the following conditions shall be met:

- (1) The space behind the access panels shall not be used for air-handling purposes.
- (2) Where the space behind the access panels is used for environmental air, other than ducts and plenums, there shall be no provisions for plug-in connections, and the conductors shall be insulated.

Busways are commonly used as feeders and are mounted horizontally in industrial buildings or mounted vertically in high-rise buildings. See **Exhibit 368.2** for an illustration of a busway installed in the space above a dropped or hung ceiling. The space is not being used as an "other space for environmental air" and can contain the plug-in devices for supplying luminaires or other electrical equipment.

(C) Through Walls and Floors. Busways shall be permitted to be installed through walls or floors in accordance with (C)(1) and (C)(2).

(1) Walls. Unbroken lengths of busway shall be permitted to be extended through dry walls.

(2) Floors. Floor penetrations shall comply with (a) and (b):

(a) Busways shall be permitted to be extended vertically through dry floors if totally enclosed (unventilated) where passing through and for a minimum distance of 1.8 m (6 ft) above the floor to provide adequate protection from physical damage.

(b) In other than industrial establishments, where a vertical riser penetrates two or more dry floors, a minimum 100-mm (4-in.) high curb shall be installed around all floor openings for riser busways to prevent liquids from entering the opening. The curb shall be installed within 300 mm (12 in.) of the floor opening. Electrical equipment shall be located so that it will not be damaged by liquids that are retained by the curb.

A busway or fitting containing a vapor seal has not been investigated for passage through a fire-rated wall or floor unless marked for such use.

EXHIBIT 368.1 A section of feeder busway, which is one of four types of busways covered. (Courtesy of Square D™ by Schneider Electric)

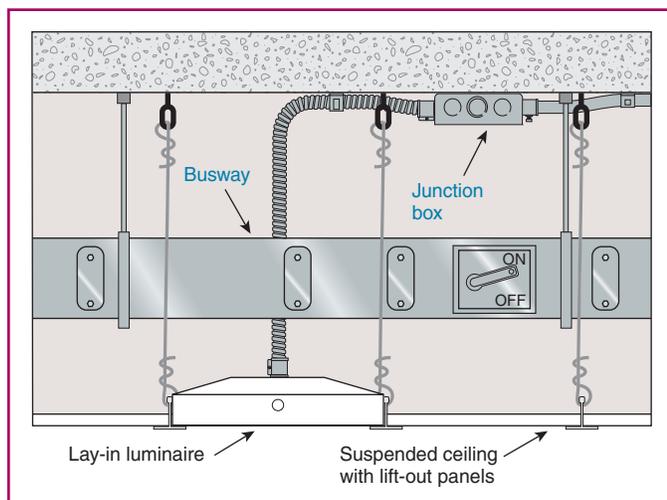

EXHIBIT 368.2 An example of a busway mounted in the space above a hung ceiling.

The requirements of 300.21 are extremely important in order to confine a fire and the products of combustion at their origin.

368.12 Uses Not Permitted.

(A) Physical Damage. Busways shall not be installed where subject to severe physical damage or corrosive vapors.

(B) Hoistways. Busways shall not be installed in hoistways.

(C) Hazardous Locations. Busways shall not be installed in any hazardous (classified) location, unless specifically approved for such use.

Informational Note: See 501.10(B).

(D) Wet Locations. Busways shall not be installed outdoors or in wet or damp locations unless identified for such use.

(E) Working Platform. Lighting busway and trolley busway shall not be installed less than 2.5 m (8 ft) above the floor or working platform unless provided with an identified cover.

368.17 Overcurrent Protection. Overcurrent protection shall be provided in accordance with 368.17(A) through (D).

(A) Rating of Overcurrent Protection — Feeders. A busway shall be protected against overcurrent in accordance with the allowable current rating of the busway.

Exception No. 1: The applicable provisions of 240.4 shall be permitted.

Exception No. 2: Where used as transformer secondary ties, the provisions of 450.6(A)(3) shall be permitted.

Busways not intended for use ahead of service equipment are marked with the maximum rating of overcurrent protection required on the supply side. The current rating of a busway can be determined in the field only by reference to the nameplate data. The applicable sections of 240.4 referenced in Exception No. 1 are 240.4(B) and (C).

(B) Reduction in Ampacity Size of Busway. Overcurrent protection shall be required where busways are reduced in ampacity.

Exception: For industrial establishments only, omission of overcurrent protection shall be permitted at points where busways are reduced in ampacity, provided that the length of the busway having the smaller ampacity does not exceed 15 m (50 ft) and has an ampacity at least equal to one-third the rating or setting of the overcurrent device next back on the line, and provided that such busway is free from contact with combustible material.

In industrial establishments, where the size of a smaller busway is kept within the specified limits, providing overcurrent protection at the point where the size is changed is not required. For example, a busway protected by a 1200-ampere overcurrent device may be reduced in size, provided the smaller busway has a current rating of at least 400 amperes ($\frac{1}{3}$ of 1200 amperes) and does not extend more than 50 feet.

(C) Feeder or Branch Circuits. Where a busway is used as a feeder, devices or plug-in connections for tapping off feeder or branch circuits from the busway shall contain the overcurrent devices required for the protection of the feeder or branch circuits. The plug-in device shall consist of an externally operable circuit breaker or an externally operable fusible switch. Where such devices are mounted out of reach and contain disconnecting means, suitable means such as ropes, chains, or sticks shall be provided for operating the disconnecting means from the floor.

Exception No. 1: As permitted in 240.21.

Exception No. 2: For fixed or semifixed luminaires, where the branch-circuit overcurrent device is part of the luminaire cord plug on cord-connected luminaires.

Exception No. 3: Where luminaires without cords are plugged directly into the busway and the overcurrent device is mounted on the luminaire.

Exception No. 4: Where the branch-circuit overcurrent plug-in device is directly supplying a readily accessible disconnect, a method of floor operation shall not be required.

Exception No. 4 allows alternative methods of providing ready access to disconnects with an equivalent level of safety. Receptacles may be used as a disconnecting means where permitted.

(D) Rating of Overcurrent Protection — Branch Circuits. A busway used as a branch circuit shall be protected against overcurrent in accordance with 210.20.

368.30 Support. Busways shall be securely supported at intervals not exceeding 1.5 m (5 ft) unless otherwise designed and marked.

Busways are marked when suitable for installation in a specified position, for use in vertical runs, or for support at intervals greater than 5 feet.

368.56 Branches from Busways. Branches from busways shall be permitted to be made in accordance with 368.56(A), (B), and (C).

(A) General. Branches from busways shall be permitted to use any of the following wiring methods:

- (1) Type AC armored cable
- (2) Type MC metal-clad cable
- (3) Type MI mineral-insulated, metal-sheathed cable
- (4) Type IMC intermediate metal conduit
- (5) Type RMC rigid metal conduit
- (6) Type FMC flexible metal conduit
- (7) Type LFMC liquidtight flexible metal conduit
- (8) Type PVC rigid polyvinyl chloride conduit
- (9) Type RTRC reinforced thermosetting resin conduit
- (10) Type LFNC liquidtight flexible nonmetallic conduit
- (11) Type EMT electrical metallic tubing
- (12) Type ENT electrical nonmetallic tubing
- (13) Busways
- (14) Strut-type channel raceway
- (15) Surface metal raceway
- (16) Surface nonmetallic raceway

Where a separate equipment grounding conductor is used, connection of the equipment grounding conductor to the busway shall comply with 250.8 and 250.12.

(B) Cord and Cable Assemblies. Suitable cord and cable assemblies approved for extra-hard usage or hard usage and listed bus drop cable shall be permitted as branches from busways for the connection of portable equipment or the connection of stationary equipment to facilitate their interchange in accordance with 400.10 and 400.12 and the following conditions:

- (1) The cord or cable shall be attached to the building by an approved means.
- (2) The length of the cord or cable from a busway plug-in device to a suitable tension take-up support device shall not exceed 1.8 m (6 ft).
- (3) The cord and cable shall be installed as a vertical riser from the tension take-up support device to the equipment served.
- (4) Strain relief cable grips shall be provided for the cord or cable at the busway plug-in device and equipment terminations.

Exception to (B)(2): In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, lengths exceeding 1.8 m (6 ft) shall be permitted between the busway plug-in device and the tension take-up support device where the cord or cable is supported at intervals not exceeding 2.5 m (8 ft).

Exhibit 368.3 illustrates a cable or cord branch from a busway installed according to the requirements of 368.56(B)(2). Exhibit 368.4 illustrates a cable or cord branch from a busway installed according to 368.56(B)(2), Exception.

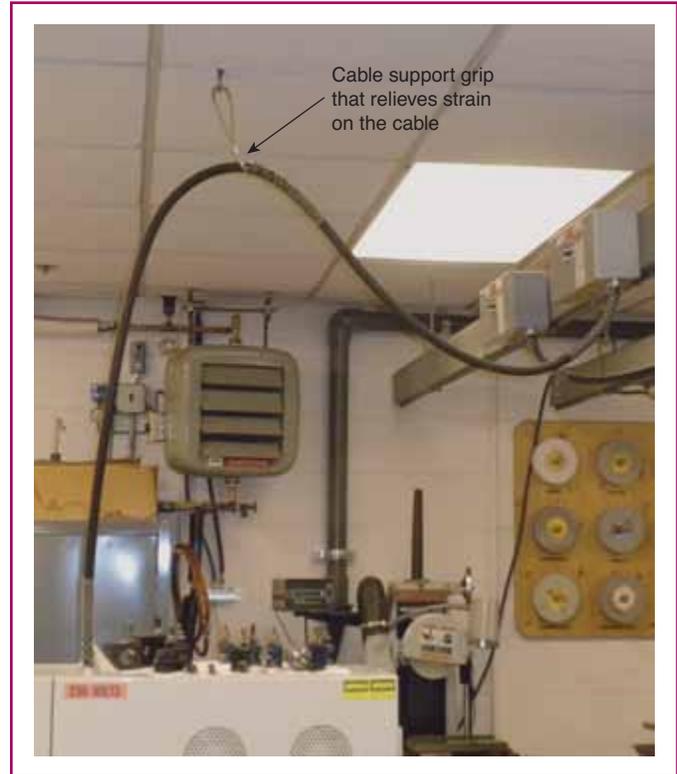

EXHIBIT 368.3 An example of a cable or cord branch from a busway installed according to 368.56(B).

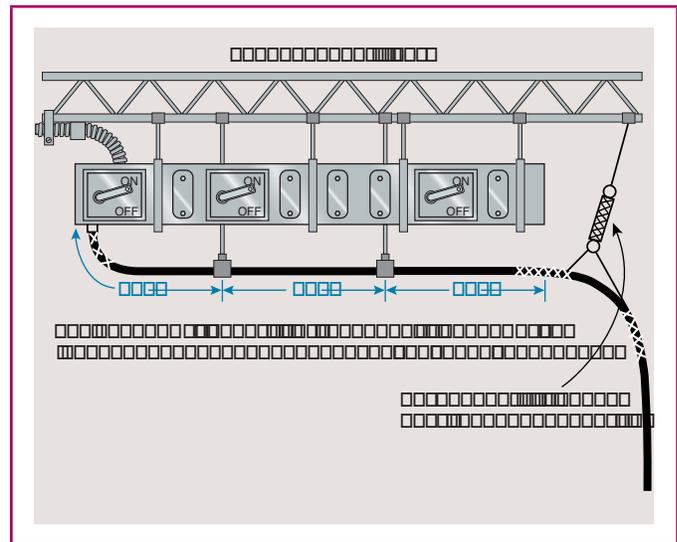

EXHIBIT 368.4 An example of an installation permitted only in industrial occupancies with other restrictions.

(C) Branches from Trolley-Type Busways. Suitable cord and cable assemblies approved for extra-hard usage or hard usage and listed bus drop cable shall be permitted as branches from trolley-type busways for the connection of movable equipment in accordance with 400.10 and 400.12.

368.58 Dead Ends. A dead end of a busway shall be closed.

368.60 Grounding. Busway shall be connected to an equipment grounding conductor(s), to an equipment bonding jumper, or to the grounded conductor where permitted or required by 250.92(B)(1) or 250.142.

The metal enclosure of a listed busway is intended for use as an EGC. In some cases, an additional grounding bus may also act as an EGC.

Part III. Construction

368.120 Marking. Busways shall be marked with the voltage and current rating for which they are designed, and with the manufacturer's name or trademark in such a manner as to be visible after installation.

Part IV. Requirements for Over 1000 Volts, Nominal

368.214 Adjacent and Supporting Structures. Metal-enclosed busways shall be installed so that temperature rise from induced circulating currents in adjacent ferrous metal parts will not be hazardous to personnel or constitute a fire hazard.

368.234 Barriers and Seals.

(A) Vapor Seals. Busway runs that have sections located both inside and outside of buildings shall have a vapor seal at the building wall to prevent interchange of air between indoor and outdoor sections.

Exception: Vapor seals shall not be required in forced-cooled bus.

(B) Fire Barriers. Fire barriers shall be provided where fire walls, floors, or ceilings are penetrated.

Informational Note: See 300.21 for information concerning the spread of fire or products of combustion.

A busway or fitting containing a vapor seal has not been investigated for passage through a fire-rated wall unless marked otherwise.

368.236 Drain Facilities. Drain plugs, filter drains, or similar methods shall be provided to remove condensed moisture from low points in busway run.

368.237 Ventilated Bus Enclosures. Ventilated busway enclosures shall be installed in accordance with Article 110, Part III, and 490.24.

368.238 Terminations and Connections. Where bus enclosures terminate at machines cooled by flammable gas, seal-off bushings, baffles, or other means shall be provided to prevent accumulation of flammable gas in the busway enclosures.

All conductor termination and connection hardware shall be accessible for installation, connection, and maintenance.

368.239 Switches. Switching devices or disconnecting links provided in the busway run shall have the same momentary rating as the busway. Disconnecting links shall be plainly marked to be removable only when bus is de-energized. Switching devices that are not load-break shall be interlocked to prevent operation under load, and disconnecting link enclosures shall be interlocked to prevent access to energized parts.

368.240 Wiring 1000 Volts or Less, Nominal. Secondary control devices and wiring that are provided as part of the metal-enclosed bus run shall be insulated by fire-retardant barriers from all primary circuit elements with the exception of short lengths of wire, such as at instrument transformer terminals.

368.244 Expansion Fittings. Flexible or expansion connections shall be provided in long, straight runs of bus to allow for temperature expansion or contraction, or where the busway run crosses building vibration insulation joints.

368.258 Neutral Conductor. Neutral bus, where required, shall be sized to carry all neutral load current, including harmonic currents, and shall have adequate momentary and short-circuit rating consistent with system requirements.

368.260 Grounding. Metal-enclosed busway shall be grounded.

368.320 Marking. Each busway run shall be provided with a permanent nameplate on which the following information shall be provided:

- (1) Rated voltage.
- (2) Rated continuous current; if bus is forced-cooled, both the normal forced-cooled rating and the self-cooled (not forced-cooled) rating for the same temperature rise shall be given.
- (3) Rated frequency.
- (4) Rated impulse withstand voltage.
- (5) Rated 60-Hz withstand voltage (dry).
- (6) Rated momentary current.
- (7) Manufacturer's name or trademark.

Informational Note: See ANSI C37.23-1987 (R1991), *Guide for Metal-Enclosed Bus and Calculating Losses in Isolated-Phase Bus*, for construction and testing requirements for metal-enclosed buses.

Part I. General

370.1 Scope. This article covers the use and installation requirements of cablebus and associated fittings.

Cablebus consists of a metal structure or framework installed in a manner similar to that of a cable tray support system. As illustrated in Exhibit 370.1, insulated conductors of 1/0 AWG or larger are field installed within the framework on special insulating blocks at specified intervals to provide controlled spacing between conductors. A ventilated top cover is attached to the framework to completely enclose the conductors.

EXHIBIT 370.1 A section of cablebus with conductors in place and the ventilated top cover ready to be attached to the busway frame. (Courtesy of MP Husky Cable Bus & Cable Tray)

370.2 Definition.

Cablebus. An assembly of units or sections with insulated conductors having associated fittings forming a structural system used to securely fasten or support conductors and conductor terminations in a completely enclosed, ventilated, protective metal housing. This assembly is designed to carry fault current and to withstand the magnetic forces of such current.

Informational Note: Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer in accordance with instructions for the specific job.

Part II. Installation

370.10 Uses Permitted. Approved cablebus shall be permitted:

- (1) At any voltage or current for which spaced conductors are rated and where installed only for exposed work, except as permitted in 370.18
- (2) For branch circuits, feeders, and services
- (3) To be installed outdoors or in corrosive, wet, or damp locations where identified for the use

370.12 Uses Not Permitted. Cablebus shall not be permitted to be installed in the following:

- (1) Hoistways
- (2) Hazardous (classified) locations, unless specifically permitted in Chapter 5

370.18 Cablebus Installation.

(A) Transversely Routed. Cablebus shall be permitted to extend transversely through partitions or walls, other than fire walls, provided that the section within the wall is continuous, protected against physical damage, and unventilated.

(B) Through Dry Floors and Platforms. Except where firestops are required, cablebus shall be permitted to extend vertically through dry floors and platforms, provided that the cablebus is totally enclosed at the point where it passes through the floor or platform and for a distance of 1.8 m (6 ft) above the floor or platform.

(C) Through Floors and Platforms in Wet Locations. Except where firestops are required, cablebus shall be permitted to extend vertically through floors and platforms in wet locations where:

- (1) There are curbs or other suitable means to prevent water-flow through the floor or platform opening, and
- (2) Where the cablebus is totally enclosed at the point where it passes through the floor or platform and for a distance of 1.8 m (6 ft) above the floor or platform.

370.20 Conductor Size and Termination.

(A) Conductors. The current-carrying conductors in cablebus shall:

- (1) Have an insulation rating of 75°C (167°F) or higher and be of an approved type suitable for the application.
- (2) Be sized in accordance with the design of the cablebus but in no case be smaller than 1/0.

(B) Termination. Approved terminating means shall be used for connections to cablebus conductors.

370.22 Number of Conductors. The number of conductors shall be that for which the cablebus is designed.

370.23 Overcurrent Protection. Cablebus shall be protected against overcurrent in accordance with the allowable ampacity of the cablebus conductors in accordance with 240.4.

Exception: Overcurrent protection shall be permitted in accordance with 240.100 and 240.101.

370.30 Securing and Supporting.

(A) Cablebus Supports. Cablebus shall be securely supported at intervals not exceeding 3.7 m (12 ft). Where spans longer than 3.7 m (12 ft) are required, the structure shall be specifically designed for the required span length.

(B) Conductor Supports. The insulated conductors shall be supported on blocks or other identified mounting means.

The individual conductors in a cablebus shall be supported at intervals not greater than 900 mm (3 ft) for horizontal runs and 450 mm (1½ ft) for vertical runs. Vertical and horizontal spacing between supported conductors shall be not less than one conductor diameter at the points of support.

370.42 Fittings. A cablebus system shall include approved fittings for the following:

- (1) Changes in horizontal or vertical direction of the run
- (2) Dead ends
- (3) Terminations in or on connected apparatus or equipment or the enclosures for such equipment
- (4) Additional physical protection where required, such as guards where subject to severe physical damage

370.60 Grounding. A cablebus system shall be grounded and/or bonded as applicable:

- (1) Cablebus framework, where bonded, shall be permitted to be used as the equipment grounding conductor for branch circuits and feeders.
- (2) A cablebus installation shall be grounded and bonded in accordance with Article 250, excluding 250.86, Exception No. 2.

370.80 Ampacity of Conductors. The ampacity of conductors in cablebus shall be in accordance with Table 310.15(B)(17) and Table 310.15(B)(19) for installations up to and including 2000 volts, or with Table 310.60(C)(69) and Table 310.60(C)(70) for installations 2001 to 35,000 volts.

Where these conductors terminate at circuit breakers, distribution switchgear, and similar electrical equipment, the temperature limitations of the electrical equipment terminals should be coordinated with the conductor ampacity.

Part III. Construction Specifications

370.120 Marking. Each section of cablebus shall be marked with the manufacturer's name or trade designation and the maximum diameter, number, voltage rating, and ampacity of the conductors to be installed. Markings shall be located so as to be visible after installation.

- 372.22 Maximum Number of Conductors
- 372.23 Ampacity of Conductors
- 372.56 Splices and Taps
- 372.58 Discontinued Outlets

Part I. General

372.1 Scope. This article covers cellular concrete floor raceways, the hollow spaces in floors constructed of precast cellular concrete slabs, together with suitable metal fittings designed to provide access to the floor cells.

Cellular concrete floor raceways are a form of floor deck construction commonly used in high-rise office buildings. This construction method is very similar in design, application, and adaptation to cellular metal floor raceways. Basically, this wiring method consists of floor cells (that are part of the structural floor system), header ducts laid at right angles to the cells (used to carry conductors from cabinets to cells), and junction boxes.

372.2 Definitions.

Cell. A single, enclosed tubular space in a floor made of precast cellular concrete slabs, the direction of the cell being parallel to the direction of the floor member.

Header. Transverse metal raceways for electrical conductors, providing access to predetermined cells of a precast cellular concrete floor, thereby permitting the installation of electrical conductors from a distribution center to the floor cells.

Part II. Installations

372.12 Uses Not Permitted. Conductors shall not be installed in precast cellular concrete floor raceways as follows:

- (1) Where subject to corrosive vapor
- (2) In any hazardous (classified) location, except as permitted by other articles in this *Code*
- (3) In commercial garages, other than for supplying ceiling outlets or extensions to the area below the floor but not above

Informational Note: See 300.8 for installation of conductors with other systems.

N 372.18 Cellular Concrete Floor Raceways Installation.

Installation of cellular concrete floor raceways shall comply with 372.18(A) through 372.18(E).

(A) Header. The header shall be installed in a straight line at right angles to the cells. The header shall be mechanically secured to the top of the precast cellular concrete floor. The end joints shall be closed by a metal closure fitting and sealed against the entrance of concrete. The header shall be electrically continuous throughout its entire length and shall be electrically bonded to the enclosure of the distribution center.

(B) Connection to Cabinets and Other Enclosures. Connections from headers to cabinets and other enclosures shall be made by means of listed metal raceways and listed fittings.

(C) Junction Boxes. Junction boxes shall be leveled to the floor grade and sealed against the free entrance of water or concrete. Junction boxes shall be of metal and shall be mechanically and electrically continuous with the header.

(D) Inserts. Inserts shall be leveled and sealed against the entrance of concrete. Inserts shall be of metal and shall be fitted with grounded-type receptacles. A grounding conductor shall connect the insert receptacles to a positive ground connection provided on the header. Where cutting through the cell wall for setting inserts or other purposes (such as providing access openings between header and cells), chips and other dirt shall not be allowed to remain in the raceway, and the tool used shall be designed so as to prevent the tool from entering the cell and damaging the conductors.

(E) Markers. A suitable number of markers shall be installed for the future location of cells.

372.20 Size of Conductors. No conductor larger than 1/0 AWG shall be installed, except by special permission.

372.22 Maximum Number of Conductors. The combined cross-sectional area of all conductors or cables shall not exceed 40 percent of the cross-sectional area of the cell or header.

372.23 Ampacity of Conductors. The ampacity adjustment factors as provided in 310.15(B)(3) shall apply to conductors installed in cellular concrete floor raceways.

372.56 Splices and Taps. Splices and taps shall be made only in header access units or junction boxes. A continuous unbroken conductor connecting the individual outlets is not a splice or tap.

372.58 Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

- 374.58 Discontinued Outlets

Part III. Construction Specifications

- 374.100 General

Part I. General

374.1 Scope. This article covers the use and installation requirements for cellular metal floor raceways.

Cellular metal floor raceways, as shown in Exhibit 374.1, are a form of metal floor deck construction designed for use in steel-frame buildings and consist of sheet metal formed into shapes that are combined to form cells or raceways. The cells extend across the building and, depending on the structural strength required, can have various shapes and sizes.

Connections to the cells are made by means of headers extending across the cells and connecting only to those cells to be used as raceways for the conductors. Two or three separate headers, connecting to different sets of cells, may be used for different systems, such as light and power, signaling, and communications systems.

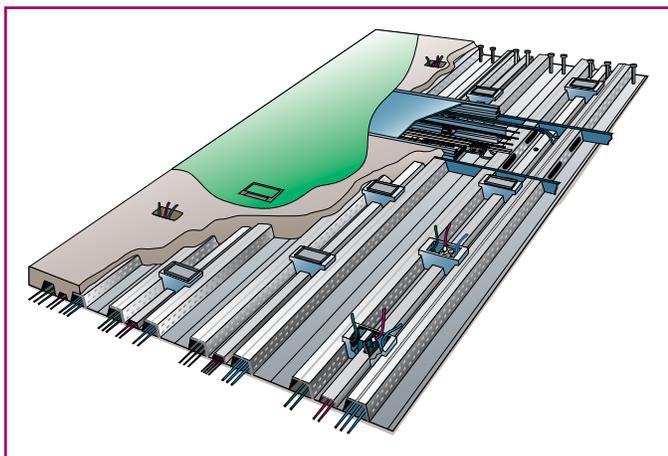

EXHIBIT 374.1 An illustration of a cross section of cellular metal floor raceway system. (Courtesy of H.H. Robertson Floor Systems)

374.2 Definitions.

Cellular Metal Floor Raceway. The hollow spaces of cellular metal floors, together with suitable fittings, that may be approved as enclosed channel for electrical conductors.

Cell. A single enclosed tubular space in a cellular metal floor member, the axis of the cell being parallel to the axis of the metal floor member.

Header. A transverse raceway for electrical conductors, providing access to predetermined cells of a cellular metal floor, thereby permitting the installation of electrical conductors from a distribution center to the cells

Part II. Installation

374.12 Uses Not Permitted. Conductors shall not be installed in cellular metal floor raceways as follows:

- (1) Where subject to corrosive vapor
- (2) In any hazardous (classified) location, except as permitted by other articles in this *Code*
- (3) In commercial garages, other than for supplying ceiling outlets or extensions to the area below the floor but not above

Informational Note: See 300.8 for installation of conductors with other systems.

374.18 Cellular Metal Floor Raceways Installations. Installation of cellular metal floor raceways shall comply with 374.18(A) through 374.18(D).

(A) Connection to Cabinets and Extensions from Cells. Connections between raceways and distribution centers and wall outlets shall be made by means of liquidtight flexible metal conduit, flexible metal conduit where not installed in concrete, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, or

approved fittings. Where there are provisions for the termination of an equipment grounding conductor, rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit, electrical non-metallic tubing, or liquidtight flexible nonmetallic conduit shall be permitted. Where installed in concrete, liquidtight flexible metal conduit and liquidtight flexible nonmetallic conduit shall be listed and marked for direct burial.

(B) Junction Boxes. Junction boxes shall be leveled to the floor grade and sealed against the free entrance of water or concrete. Junction boxes used with these raceways shall be of metal and shall be electrically continuous with the raceway.

(C) Inserts. Inserts shall be leveled to the floor grade and sealed against the entrance of concrete. Inserts shall be of metal and shall be electrically continuous with the raceway. In cutting through the cell wall and setting inserts, chips and other dirt shall not be allowed to remain in the raceway, and tools shall be used that are designed to prevent the tool from entering the cell and damaging the conductors.

(D) Markers. A suitable number of markers shall be installed for locating cells in the future.

374.20 Size of Conductors. No conductor larger than 1/0 AWG shall be installed, except by special permission.

374.22 Maximum Number of Conductors in Raceway. The combined cross-sectional area of all conductors or cables shall not exceed 40 percent of the interior cross-sectional area of the cell or header.

374.23 Ampacity of Conductors. The ampacity adjustment factors in 310.15(B)(3) shall apply to conductors installed in cellular metal floor raceways.

374.56 Splices and Taps. Splices and taps shall be made only in header access units or junction boxes.

For the purposes of this section, so-called loop wiring (continuous unbroken conductor connecting the individual outlets) shall not be considered to be a splice or tap.

374.58 Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or re-insulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

Part III. Construction Specifications

374.100 General. Cellular metal floor raceways shall be constructed so that adequate electrical and mechanical continuity of the complete system will be secured. They shall provide a complete enclosure for the conductors. The interior surfaces shall be free from burrs and sharp edges, and surfaces over which conductors are drawn shall be smooth. Suitable bushings or fittings having smooth rounded edges shall be provided where conductors pass.

 - (C) Smooth Rounded Edges
 - (D) Covers
- 376.120 Marking

Part I. General

376.1 Scope. This article covers the use, installation, and construction specifications for metal wireways and associated fittings.

Wireways are sheet-metal enclosures equipped with hinged or removable covers and are manufactured in 1-foot to 10-foot lengths and various widths and depths. Couplings, elbows, end plates, and accessories such as T and X fittings are available. Unlike auxiliary gutters, which are not permitted to extend more than 30 feet from the equipment they supplement, wireways may be run throughout an entire area.

See also

366.1 and its commentary for more information on the differences between wireways and auxiliary gutters

376.2 Definition.

Metal Wireways. Sheet metal troughs with hinged or removable covers for housing and protecting electrical wires and cable and in which conductors are laid in place after the raceway has been installed as a complete system.

Part II. Installation

376.10 Uses Permitted. The use of metal wireways shall be permitted as follows:

- (1) For exposed work.
- (2) In any hazardous (classified) location, as permitted by other articles in this *Code*.
- (3) In wet locations where wireways are listed for the purpose.
- (4) In concealed spaces as an extension that passes transversely through walls, if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.

376.12 Uses Not Permitted. Metal wireways shall not be used in the following:

- (1) Where subject to severe physical damage
- (2) Where subject to severe corrosive environments

N 376.20 Conductors Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.10(H), the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

376.21 Size of Conductors. No conductor larger than that for which the wireway is designed shall be installed in any wireway.

376.22 Number of Conductors and Ampacity. The number of conductors or cables and their ampacity shall comply with 376.22(A) and (B).

The requirements for the number of conductors for metal wireways are as follows:

- All conductors count in determining wireway fill.
- Total conductor fill must not exceed 20 percent of the wireway.

The conductor ampacity requirements are as follows:

- Conductor ampacity is determined according to 310.15.
- The adjustment factors of 310.15(B)(3)(a) only apply when the number of current-carrying conductors at the same cross-sectional area, including any current-carrying neutrals, exceeds 30.

- Signaling circuit conductors are not considered current-carrying conductors.
- Conductors used only for motor-starting duty are not considered current-carrying conductors.

(A) Cross-Sectional Areas of Wireway. The sum of the cross-sectional areas of all contained conductors and cables at any cross section of a wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.

(B) Adjustment Factors. The adjustment factors in 310.15(B)(3)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(5), exceeds 30 at any cross section of the wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

376.23 Insulated Conductors. Insulated conductors installed in a metal wireway shall comply with 376.23(A) and (B).

(A) Deflected Insulated Conductors. Where insulated conductors are deflected within a metal wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the metal wireway, or where the direction of the metal wireway is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 312.6(A) shall apply.

(B) Metal Wireways Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required by 314.28(A)(1) for straight pulls and 314.28(A)(2) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

The same minimum dimension requirements associated with raceway entries of pull boxes apply to metal wireways.

376.30 Securing and Supporting. Metal wireways shall be supported in accordance with 376.30(A) and (B).

(A) Horizontal Support. Wireways shall be supported where run horizontally at each end and at intervals not to exceed 1.5 m (5 ft) or for individual lengths longer than 1.5 m (5 ft) at each end or joint, unless listed for other support intervals. The distance between supports shall not exceed 3 m (10 ft).

(B) Vertical Support. Vertical runs of wireways shall be securely supported at intervals not exceeding 4.5 m (15 ft) and shall not have more than one joint between supports. Adjoining

wireway sections shall be securely fastened together to provide a rigid joint.

376.56 Splices, Taps, and Power Distribution Blocks.

(A) Splices and Taps. Splices and taps shall be permitted within a wireway, provided they are accessible. The conductors, including splices and taps, shall not fill the wireway to more than 75 percent of its area at that point.

(B) Power Distribution Blocks.

(1) Installation. Power distribution blocks installed in metal wireways shall be listed. Power distribution blocks installed on the line side of the service equipment shall be marked “suitable for use on the line side of service equipment” or equivalent.

(2) Size of Enclosure. In addition to the wiring space requirement in 376.56(A), the power distribution block shall be installed in a wireway with dimensions not smaller than specified in the installation instructions of the power distribution block.

(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with 312.6(B).

(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a wireway, whether or not the wireway cover is installed.

(5) Conductors. Conductors shall be arranged so the power distribution block terminals are unobstructed following installation.

376.58 Dead Ends. Dead ends of metal wireways shall be closed

376.70 Extensions from Metal Wireways. Extensions from wireways shall be made with cord pendants installed in accordance with 400.14 or with any wiring method in Chapter 3 that includes a means for equipment grounding. Where a separate equipment grounding conductor is employed, connection of the equipment grounding conductors in the wiring method to the wireway shall comply with 250.8 and 250.12.

Extensions from wireways are made through knockouts provided on the wireway or field punched. The extension wiring method must provide for equipment grounding. Cables and nonmetallic raceways as well as the wireway must include a wire-type equipment grounding conductor (EGC) to ensure effective continuation of the ground path.

Part III. Construction Specifications

376.100 Construction.

(A) Electrical and Mechanical Continuity. Wireways shall be constructed and installed so that electrical and mechanical continuity of the complete system are assured.

(B) Substantial Construction. Wireways shall be of substantial construction and shall provide a complete enclosure for the contained conductors. All surfaces, both interior and exterior, shall be suitably protected from corrosion. Corner joints shall be made tight, and where the assembly is held together by rivets, bolts, or screws, such fasteners shall be spaced not more than 300 mm (12 in.) apart.

(C) Smooth Rounded Edges. Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors pass between wireways, through partitions, around bends, between wireways and cabinets or junction boxes, and at other locations where necessary to prevent abrasion of the insulation of the conductors.

(D) Covers. Covers shall be securely fastened to the wireway.

These requirements aid in the construction of custom-made wireways and fittings.

376.120 Marking. Metal wireways shall be so marked that their manufacturer's name or trademark will be visible after installation.

Part III. Construction Specifications

- 378.120 Marking

Part I. General

378.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic wireways and associated fittings.

378.2 Definition.

Nonmetallic Wireways. Flame-retardant, nonmetallic troughs with removable covers for housing and protecting electrical wires and cables in which conductors are laid in place after the raceway has been installed as a complete system.

378.6 Listing Requirements. Nonmetallic wireways and associated fittings shall be listed.

Part II. Installation

378.10 Uses Permitted. The use of nonmetallic wireways shall be permitted in the following:

- (1) Only for exposed work, except as permitted in 378.10(4).
- (2) Where subject to corrosive environments where identified for the use.
- (3) In wet locations where listed for the purpose.

Informational Note: Extreme cold may cause nonmetallic wireways to become brittle and therefore more susceptible to damage from physical contact.

- (4) As extensions to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.

378.12 Uses Not Permitted. Nonmetallic wireways shall not be used in the following:

- (1) Where subject to physical damage
- (2) In any hazardous (classified) location, except as permitted by other articles in this *Code*
- (3) Where exposed to sunlight unless listed and marked as suitable for the purpose
- (4) Where subject to ambient temperatures other than those for which nonmetallic wireway is listed
- (5) For conductors whose insulation temperature limitations would exceed those for which the nonmetallic wireway is listed

378.20 Conductors Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.10(H), the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

378.21 Size of Conductors. No conductor larger than that for which the nonmetallic wireway is designed shall be installed in any nonmetallic wireway.

378.22 Number of Conductors. The sum of cross-sectional areas of all contained conductors or cables at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

The adjustment factors specified in 310.15(B)(3)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified in the first paragraph of this section.

The requirements for the number of conductors for nonmetallic wireways are as follows:

- All conductors count in determining wireway fill.
- Total conductor fill must not exceed 20 percent of the wireway.

The conductor ampacity requirements are as follows:

- Conductor ampacity is determined according to 310.15.
- The adjustment factors of 310.15(B)(3)(a) apply when the number of current-carrying conductors is four or more.
- Signaling circuit conductors are not considered current-carrying conductors.
- Conductors used only for motor-starting duty are not considered current-carrying conductors.

378.23 Insulated Conductors. Insulated conductors installed in a nonmetallic wireway shall comply with 378.23(A) and (B).

(A) Deflected Insulated Conductors. Where insulated conductors are deflected within a nonmetallic wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the nonmetallic wireway, or where the direction of the nonmetallic wireway is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 312.6(A) shall apply.

(B) Nonmetallic Wireways Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required in 314.28(A)(1) for straight pulls and in 314.28(A)(2) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

These requirements provide adequate space for installing and bending conductors without damaging the conductor insulation. Section 378.23(A) requires that the Table 312.6(A) column of one wire per terminal be used. Section 378.23(B) requires that the same adequate space requirements that apply to conduits entering boxes also apply to cables as they enter a wireway. Where wireways are used as pull boxes,

cable entries are converted to a minimum raceway trade size to determine wireway dimensions.

378.30 Securing and Supporting. Nonmetallic wireway shall be supported in accordance with 378.30(A) and (B).

(A) Horizontal Support. Nonmetallic wireways shall be supported where run horizontally at intervals not to exceed 900 mm (3 ft), and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 m (10 ft).

(B) Vertical Support. Vertical runs of nonmetallic wireway shall be securely supported at intervals not exceeding 1.2 m (4 ft), unless listed for other support intervals, and shall not have more than one joint between supports. Adjoining nonmetallic wireway sections shall be securely fastened together to provide a rigid joint.

378.44 Expansion Fittings. Expansion fittings for nonmetallic wireway shall be provided to compensate for thermal expansion and contraction where the length change is expected to be 6 mm (0.25 in.) or greater in a straight run.

Informational Note: See Table 352.44 for expansion characteristics of PVC conduit. The expansion characteristics of PVC nonmetallic wireway are identical.

378.56 Splices and Taps. Splices and taps shall be permitted within a nonmetallic wireway, provided they are accessible. The conductors, including splices and taps, shall not fill the nonmetallic wireway to more than 75 percent of its area at that point.

378.58 Dead Ends. Dead ends of nonmetallic wireway shall be closed using listed fittings.

378.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the nonmetallic wireway. A separate equipment grounding conductor shall not be required where the grounded conductor is used to ground equipment as permitted in 250.142.

378.70 Extensions from Nonmetallic Wireways. Extensions from nonmetallic wireway shall be made with cord pendants or any wiring method of Chapter 3. A separate equipment grounding conductor shall be installed in, or an equipment grounding connection shall be made to, any of the wiring methods used for the extension.

Part III. Construction Specifications

378.120 Marking. Nonmetallic wireways shall be marked so that the manufacturer's name or trademark and interior cross-sectional area in square inches shall be visible after installation. Marking for limited smoke shall be permitted on the nonmetallic wireways that have limited smoke-producing characteristics.

380.76 Metal Multioutlet Assembly Through Dry Partitions

Part I. General

380.1 Scope. This article covers the use and installation requirements for multioutlet assemblies.

Informational Note: See the definition of multioutlet assembly in [Article 100](#).

Multioutlet assemblies are metal or nonmetallic raceways that are usually surface mounted and designed to contain branch-circuit conductors and receptacles. [Exhibit 380.1](#) provides an illustration of a multioutlet assembly. Receptacles may be spaced at desired intervals and may be assembled at the factory or in the field.

See also

[220.14\(H\)](#) and [Exhibit 220 4](#) for load calculations

Part II. Installation

380.10 Uses Permitted. The use of a multioutlet assembly shall be permitted in dry locations.

380.12 Uses Not Permitted. A multioutlet assembly shall not be installed as follows:

- (1) Where concealed, except that it shall be permissible to surround the back and sides of a metal multioutlet assembly by the building finish or recess a nonmetallic multioutlet assembly in a baseboard

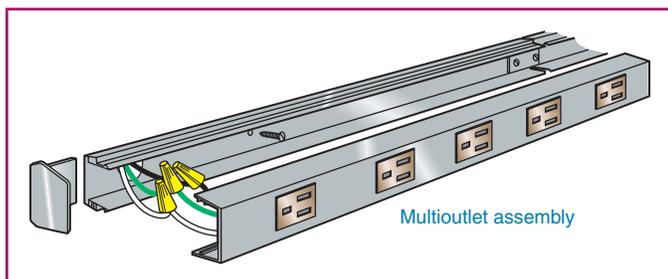

EXHIBIT 380.1 A typical multioutlet assembly shown in an exploded view.

- (2) Where subject to severe physical damage
- (3) Where the voltage is 300 volts or more between conductors unless the assembly is of metal having a thickness of not less than 1.02 mm (0.040 in.)
- (4) Where subject to corrosive vapors
- (5) In hoistways
- (6) In any hazardous (classified) location, except as permitted by other articles in this *Code*

380.23 Insulated Conductors. For field-assembled multioutlet assemblies, insulated conductors shall comply with [380.23\(A\)](#) and (B), as applicable.

(A) Deflected Insulated Conductors. Where insulated conductors are deflected within a multioutlet assembly, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the multioutlet assembly, or where the direction of the multioutlet assembly is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in [Table 312.6\(A\)](#) shall apply.

(B) Multioutlet Assemblies Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a multioutlet assembly, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required by [314.28\(A\)\(1\)](#) for straight pulls and [314.28\(A\)\(2\)](#) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

Safeguards to prevent overfill are provided by limiting the number of conductors that can be installed in multioutlet assemblies. For deflected insulated conductors dimensions corresponding to the minimum width of wiring gutters must be maintained.

Where a multioutlet assembly is used as a pull box for insulated conductors of 4 AWG or larger, the distance between the raceway and the cable entries enclosing the conductor must not be less than eight times the trade size or metric designator of the raceway for straight pulls. For angle pulls, the distance must be six times the trade size or metric designator of the raceway.

380.76 Metal Multioutlet Assembly Through Dry Partitions. It shall be permissible to extend a metal multioutlet assembly through (not run within) dry partitions if arrangements are made for removing the cap or cover on all exposed portions and no outlet is located within the partitions.

Part I. General

382.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic extensions.

382.2 Definitions.

Concealable Nonmetallic Extension. A listed assembly of two, three, or four insulated circuit conductors within a nonmetallic jacket, an extruded thermoplastic covering, or a sealed nonmetallic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings, and concealed with paint, texture, joint compound, plaster, wallpaper, tile, wall paneling, or other similar materials.

Nonmetallic Extension. An assembly of two insulated conductors within a nonmetallic jacket or an extruded thermoplastic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings.

382.6 Listing Requirements. Concealable nonmetallic extensions and associated fittings and devices shall be listed. The

starting/source tap device for the extension shall contain and provide the following protection for all load-side extensions and devices:

- (1) Supplementary overcurrent protection
- (2) Level of protection equivalent to a Class A GFCI
- (3) Level of protection equivalent to a portable GFCI
- (4) Line and load-side miswire protection
- (5) Provide protection from the effects of arc faults

Part II. Installation

382.10 Uses Permitted. Nonmetallic extensions shall be permitted only in accordance with 382.10(A), (B), and (C).

(A) From an Existing Outlet. The extension shall be from an existing outlet on a 15- or 20-ampere branch circuit. Where a concealable nonmetallic extension originates from a non-grounding-type receptacle, the installation shall comply with 250.130(C), 406.4(D)(2)(b), or 406.4(D)(2)(c).

(B) Exposed and in a Dry Location. The extension shall be run exposed, or concealed as permitted in 382.15, and in a dry location.

(C) Residential or Offices. For nonmetallic surface extensions mounted directly on the surface of walls or ceilings, the building shall be occupied for residential or office purposes and shall not exceed three floors abovegrade. Where identified for the use, concealable nonmetallic extensions shall be permitted more than three floors abovegrade.

Informational Note No. 1: See 310.15(A)(3) for temperature limitation of conductors.

Informational Note No. 2: See 362.10 for definition of *First Floor*.

382.12 Uses Not Permitted. Nonmetallic extensions shall not be used as follows:

- (1) In unfinished basements, attics, or roof spaces
- (2) Where the voltage between conductors exceeds 150 volts for nonmetallic surface extensions and 300 volts for aerial cable
- (3) Where subject to corrosive vapors
- (4) Where run through a floor or partition, or outside the room in which it originates

382.15 Exposed.

(A) Nonmetallic Extensions. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 50 mm (2 in.) from the floor.

(B) Concealable Nonmetallic Extensions. Where identified for the use, nonmetallic extensions shall be permitted to be concealed with paint, texture, concealing compound, plaster, wallpaper, tile, wall paneling, or other similar materials and installed in accordance with 382.15(A).

382.26 Bends.

(A) Nonmetallic Extensions. A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from physical damage.

(B) Concealable Nonmetallic Extensions. Concealable extensions shall be permitted to be folded back over themselves and flattened as required for installation.

382.30 Securing and Supporting.

(A) Nonmetallic Extensions. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 200 mm (8 in.), with an allowance for 300 mm (12 in.) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to only woodwork or plaster finish and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.

(B) Concealable Nonmetallic Extensions. All surface-mounted concealable nonmetallic extension components shall be firmly anchored to the wall or ceiling using an adhesive or mechanical anchoring system identified for this use.

382.40 Boxes and Fittings. Each run shall terminate in a fitting, connector, or box that covers the end of the assembly. All fittings, connectors, and devices shall be of a type identified for the use.

382.42 Devices.

(A) Receptacles. All receptacles, receptacle housings, and self-contained devices used with concealable nonmetallic extensions shall be identified for this use.

(B) Receptacles and Housings. Receptacle housings and self-contained devices designed either for surface or for recessed mounting shall be permitted for use with concealable nonmetallic extensions. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of concealable nonmetallic extensions and for electrically connecting the housing or device. Receptacle and self-contained devices shall comply with 406.4. Power and communications outlets installed together in common housing shall be permitted in accordance with 800.133(A)(1)(d), Exception No. 2.

382.56 Splices and Taps. Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings, connectors, or devices. Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.

Part III. Construction Specifications (Concealable Nonmetallic Extensions Only)

382.100 Construction. Concealable nonmetallic extensions shall be a multilayer flat conductor design consisting of a center ungrounded conductor enclosed by a sectioned grounded conductor, and an overall sectioned grounding conductor.

382.104 Flat Conductors. Concealable nonmetallic extensions shall be constructed, using flat copper conductors equivalent to 14 AWG or 12 AWG conductor sizes, and constructed per 382.104(A), (B), and (C).

(A) Ungrounded Conductor (Center Layer). The ungrounded conductor shall consist of one or more ungrounded flat conductor(s) enclosed in accordance with 382.104(B) and (C) and identified in accordance with 310.110(C).

(B) Grounded Conductor (Inner Sectioned Layers). The grounded conductor shall consist of two sectioned inner flat conductors that enclose the center ungrounded conductor(s). The sectioned grounded conductor shall be enclosed by the sectioned grounding conductor and identified in accordance with 200.6.

(C) Grounding Conductor (Outer Sectioned Layers). The grounding conductor shall consist of two overall sectioned conductors that enclose the grounded conductor and ungrounded conductor(s) and shall comply with 250.4(A)(5). The grounding conductor layers shall be identified by any one of the following methods:

- (1) As permitted in 250.119
- (2) A clear covering
- (3) One or more continuous green stripes or hash marks
- (4) The term “Equipment Ground” printed at regular intervals throughout the cable

A multilayer flat conductor is a complete assembly of branch-circuit conductors, thinner than a business card and yet flexible enough to bend to any angle required for a customized installation. Exhibit 382.1

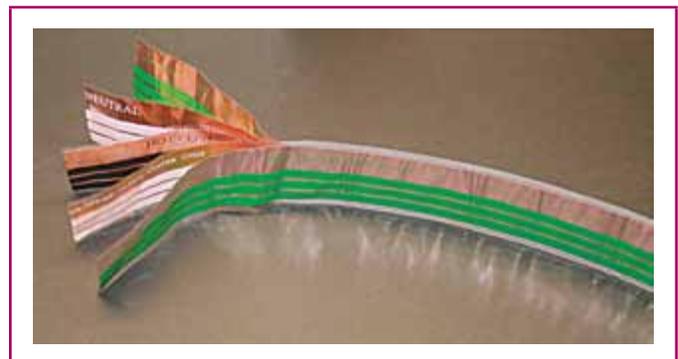

EXHIBIT 382.1 One example of a flat conductor cable assembly used as a concealable nonmetallic extension. (Courtesy of FlatWire Technologies, a division of Southwire®)

is one example of a concealable nonmetallic extension circuit conductor assembly of flat conductors meeting the requirements of Article 382.

A concealable extension is a five-layer design for circuit integrity and protection. Flat sectioned EGC layers fully encase the ungrounded conductor and grounded conductor layers of the cable. By design, any penetration in the flat wire cable assembly will penetrate the EGC layer first, then the grounded conductor layer, then the ungrounded conductor layer. A penetration will result in a short circuit between the three conductors described that will immediately trip the OCPD, causing automatic disconnection of the circuit.

382.112 Insulation. The ungrounded and grounded flat conductor layers shall be individually insulated and comply with 310.15(A)(3). The grounding conductor shall be covered or insulated.

382.120 Marking.

(A) **Cable.** Concealable nonmetallic extensions shall be clearly and durably marked on both sides at intervals of not more than 610 mm (24 in.) with the information required by 310.120(A) and with the following additional information:

- (1) Material of conductors
- (2) Maximum temperature rating
- (3) Ampacity

(B) **Conductor Identification.** Conductors shall be clearly and durably identified on both sides throughout their length as specified in 382.104.

Part I. General

384.1 Scope. This article covers the use, installation, and construction specifications of strut-type channel raceway.

384.2 Definition.

Strut-Type Channel Raceway. A metal raceway that is intended to be mounted to the surface of or suspended from a structure, with associated accessories for the installation of electrical conductors and cables.

384.6 Listing Requirements. Strut-type channel raceways and accessories shall be listed and identified for such use.

Part II. Installation

384.10 Uses Permitted. The use of strut-type channel raceways shall be permitted in the following:

- (1) Where exposed.
- (2) In dry locations.
- (3) In locations subject to corrosive vapors where protected by finishes approved for the condition.
- (4) As power poles.
- (5) In hazardous (classified) locations as permitted in Chapter 5.
- (6) As extensions of unbroken lengths through walls, partitions, and floors where closure strips are removable from either side and the portion within the wall, partition, or floor remains covered.
- (7) Ferrous channel raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors.

The installation shown in Exhibit 384.1 is typical of how a strut-type channel raceway can be used.

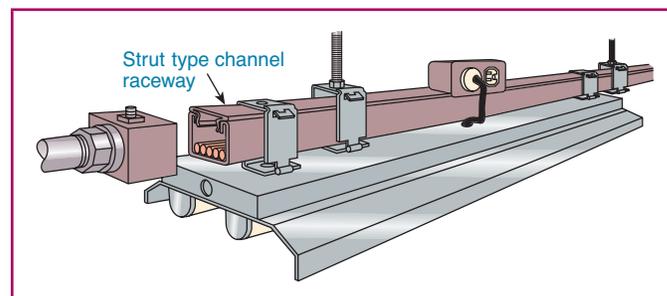

EXHIBIT 384.1 An example of a strut-type channel raceway using accessories to support and supply power to luminaires.

384.12 Uses Not Permitted. Strut-type channel raceways shall not be used as follows:

- (1) Where concealed.
- (2) Ferrous channel raceways and fittings protected from corrosion solely by enamel shall not be permitted where subject to severe corrosive influences.

384.21 Size of Conductors. No conductor larger than that for which the raceway is listed shall be installed in strut-type channel raceways.

384.22 Number of Conductors. The number of conductors or cables permitted in strut-type channel raceways shall not exceed the percentage fill using [Table 384.22](#) and applicable cross-sectional area of specific types and sizes of wire given in the tables in [Chapter 9](#).

The adjustment factors of [310.15\(B\)\(3\)\(a\)](#) shall not apply to conductors installed in strut-type channel raceways where all of the following conditions are met:

- (1) The cross-sectional area of the raceway exceeds 2500 mm² (4 in.²).
- (2) The current-carrying conductors do not exceed 30 in number.
- (3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the strut-type channel raceways.

TABLE 384.22 Channel Size and Inside Cross-Sectional Area

Size Channel	Area		40% Area*		25% Area [†]	
	in. ²	mm ²	in. ²	mm ²	in. ²	mm ²
1 $\frac{5}{8}$ × 1 $\frac{5}{16}$	0.887	572	0.355	229	0.222	143
1 $\frac{5}{8}$ × 1	1.151	743	0.460	297	0.288	186
1 $\frac{5}{8}$ × 1 $\frac{3}{8}$	1.677	1076	0.671	433	0.419	270
1 $\frac{5}{8}$ × 1 $\frac{1}{8}$	2.028	1308	0.811	523	0.507	327
1 $\frac{5}{8}$ × 2 $\frac{1}{16}$	3.169	2045	1.267	817	0.792	511
1 $\frac{5}{8}$ × 3 $\frac{1}{4}$	4.308	2780	1.723	1112	1.077	695
1 $\frac{1}{2}$ × 3 $\frac{1}{4}$	0.849	548	0.340	219	0.212	137
1 $\frac{1}{2}$ × 1 $\frac{1}{2}$	1.828	1179	0.731	472	0.457	295
1 $\frac{1}{2}$ × 1 $\frac{3}{8}$	2.301	1485	0.920	594	0.575	371
1 $\frac{1}{2}$ × 3	3.854	2487	1.542	995	0.964	622

*Raceways with external joiners shall use a 40 percent wire fill calculation to determine the number of conductors permitted.

[†]Raceways with internal joiners shall use a 25 percent wire fill calculation to determine the number of conductors permitted.

384.30 Securing and Supporting.

(A) Surface Mount. A surface mount strut-type channel raceway shall be secured to the mounting surface with retention straps

external to the channel at intervals not exceeding 3 m (10 ft) and within 900 mm (3 ft) of each outlet box, cabinet, junction box, or other channel raceway termination.

(B) Suspension Mount. Strut-type channel raceways shall be permitted to be suspension mounted in air with identified methods at intervals not to exceed 3 m (10 ft) and within 900 mm (3 ft) of channel raceway terminations and ends.

384.56 Splices and Taps. Splices and taps shall be permitted in raceways that are accessible after installation by having a removable cover. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. All splices and taps shall be made by approved methods.

384.60 Grounding. Strut-type channel raceway enclosures providing a transition to or from other wiring methods shall have a means for connecting an equipment grounding conductor. Strut-type channel raceways shall be permitted as an equipment grounding conductor in accordance with [250.118\(13\)](#). Where a snap-fit metal cover for strut-type channel raceways is used to achieve electrical continuity in accordance with the listing, this cover shall not be permitted as the means for providing electrical continuity for a receptacle mounted in the cover.

Part III. Construction Specifications

384.100 Construction. Strut-type channel raceways and their accessories shall be of a construction that distinguishes them from other raceways. Raceways and their elbows, couplings, and other fittings shall be designed such that the sections can be electrically and mechanically coupled together and installed without subjecting the wires to abrasion. They shall comply with [384.100\(A\)](#), [\(B\)](#), and [\(C\)](#).

(A) Material. Raceways and accessories shall be formed of steel, stainless steel, or aluminum.

(B) Corrosion Protection. Steel raceways and accessories shall be protected against corrosion by galvanizing or by an organic coating.

Informational Note: Enamel and PVC coatings are examples of organic coatings that provide corrosion protection.

(C) Cover. Covers of strut-type channel raceways shall be either metal or nonmetallic.

384.120 Marking. Each length of strut-type channel raceway shall be clearly and durably identified as required in the first sentence of [110.21\(A\)](#).

Part I. General

386.1 Scope. This article covers the use, installation, and construction specifications for surface metal raceways and associated fittings.

The installation shown in Exhibit 386.1 is an example of how a surface metal raceway can be used to extend branch-circuit wiring to new switch-controlled outlets.

386.2 Definition.

Surface Metal Raceway. A metal raceway that is intended to be mounted to the surface of a structure, with associated couplings, connectors, boxes, and fittings for the installation of electrical conductors.

386.6 Listing Requirements. Surface metal raceway and associated fittings shall be listed.

Part II. Installation

386.10 Uses Permitted. The use of surface metal raceways shall be permitted in the following:

- (1) In dry locations.
- (2) In Class I, Division 2 hazardous (classified) locations as permitted in 501.10(B)(3).
- (3) Under raised floors, as permitted in 645.5(E)(2).

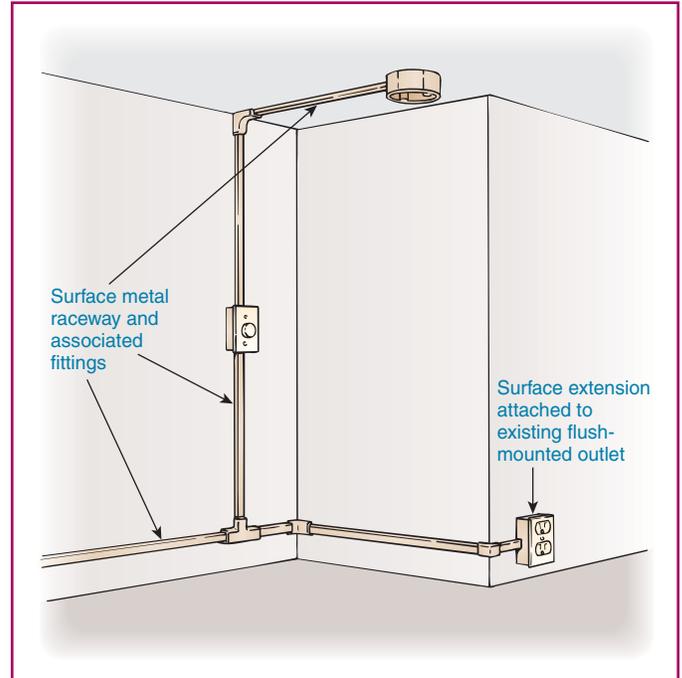

EXHIBIT 386.1 An example of a surface metal raceway extending from an existing receptacle outlet.

- (4) Extension through walls and floors. Surface metal raceway shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition or floor.

386.12 Uses Not Permitted. Surface metal raceways shall not be used in the following:

- (1) Where subject to severe physical damage, unless otherwise approved
- (2) Where the voltage is 300 volts or more between conductors, unless the metal has a thickness of not less than 1.02 mm (0.040 in.) nominal
- (3) Where subject to corrosive vapors
- (4) In hoistways
- (5) Where concealed, except as permitted in 386.10

386.21 Size of Conductors. No conductor larger than that for which the raceway is designed shall be installed in surface metal raceway.

386.22 Number of Conductors or Cables. The number of conductors or cables installed in surface metal raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles.

The adjustment factors of 310.15(B)(3)(a) shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:

- (1) The cross-sectional area of the raceway exceeds 2500 mm² (4 in.²).
- (2) The current-carrying conductors do not exceed 30 in number.
- (3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the surface metal raceway.

The number, type, and sizes of conductors permitted to be installed in a listed surface metal raceway are marked on the raceway or on the package in which it is shipped.

386.30 Securing and Supporting. Surface metal raceways and associated fittings shall be supported in accordance with the manufacturer's installation instructions.

386.56 Splices and Taps. Splices and taps shall be permitted in surface metal raceways having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. Splices and taps in surface metal raceways without removable covers shall be made only in boxes. All splices and taps shall be made by approved methods.

Taps of Type FC cable installed in surface metal raceway shall be made in accordance with 322.56(B).

386.60 Grounding Surface metal raceway enclosures providing a transition from other wiring methods shall have a means for connecting an equipment grounding conductor.

As the example in Exhibit 386.2 shows, where a surface metal raceway is supplied by Type MC or NM cable, a means (e.g., grounding terminal screw or lug) for terminating the EGC must be available at the surface metal raceway.

386.70 Combination Raceways. When combination surface metal raceways are used for both signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by stamping, imprinting, or color coding of the interior finish.

Part III. Construction Specifications

386.100 Construction. Surface metal raceways shall be of such construction as will distinguish them from other raceways. Surface metal raceways and their elbows, couplings, and similar fittings shall be designed so that the sections can be electrically and mechanically coupled together and installed without subjecting the wires to abrasion.

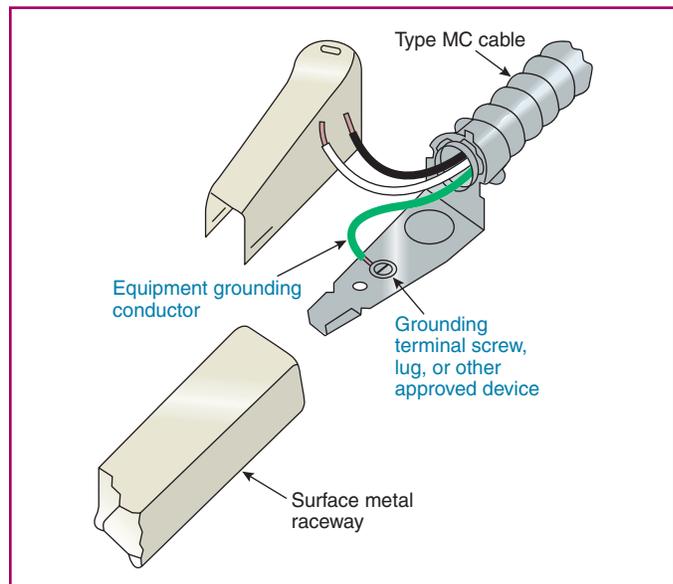

EXHIBIT 386.2 One means for terminating an EGC at a surface metal raceway.

Where covers and accessories of nonmetallic materials are used on surface metal raceways, they shall be identified for such use.

386.120 Marking. Each length of surface metal raceway shall be clearly and durably identified as required in the first sentence of 110.21(A).

EXHIBIT 388.1 An example of a surface nonmetallic raceway, resembling base molding, that supplies a receptacle outlet on the top and CATV and communications on the bottom. (Courtesy of Legrand/Wiremold®)

Part I. General

388.1 Scope. This article covers the use, installation, and construction specifications for surface nonmetallic raceways and associated fittings.

Surface nonmetallic raceways may resemble base or chair rail molding and allow for circuit conductors to be installed without the need for wall penetration. The installation shown in Exhibit 388.1 is typical of how a surface nonmetallic raceway can be used to supply power, CATV, and communications outlets.

388.2 Definition.

Surface Nonmetallic Raceway. A nonmetallic raceway that is intended to be mounted to the surface of a structure, with associated couplings, connectors, boxes, and fittings for the installation of electrical conductors.

388.6 Listing Requirements. Surface nonmetallic raceway and associated fittings shall be listed.

Part II. Installation

388.10 Uses Permitted. Surface nonmetallic raceways shall be permitted as follows:

- (1) The use of surface nonmetallic raceways shall be permitted in dry locations.
- (2) Extension through walls and floors shall be permitted. Surface nonmetallic raceway shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.

388.12 Uses Not Permitted. Surface nonmetallic raceways shall not be used in the following:

- (1) Where concealed, except as permitted in 388.10(2)
- (2) Where subject to severe physical damage
- (3) Where the voltage is 300 volts or more between conductors, unless listed for higher voltage
- (4) In hoistways
- (5) In any hazardous (classified) location, except as permitted by other articles in this Code
- (6) Where subject to ambient temperatures exceeding those for which the nonmetallic raceway is listed
- (7) For conductors whose insulation temperature limitations would exceed those for which the nonmetallic raceway is listed

388.21 Size of Conductors. No conductor larger than that for which the raceway is designed shall be installed in surface nonmetallic raceway.

388.22 Number of Conductors or Cables. The number of conductors or cables installed in surface nonmetallic raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles.

388.30 Securing and Supporting. Surface nonmetallic raceways and associated fittings shall be supported in accordance with the manufacturer's installation instructions.

388.56 Splices and Taps. Splices and taps shall be permitted in surface nonmetallic raceways having a cover capable of being opened in place that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. Splices and taps in surface nonmetallic raceways without covers capable of being opened in place shall be made only in boxes. All splices and taps shall be made by approved methods.

388.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the raceway.

388.70 Combination Raceways. When combination surface nonmetallic raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by stamping, imprinting, or color coding of the interior finish.

Part III. Construction Specifications

388.100 Construction. Surface nonmetallic raceways shall be of such construction as will distinguish them from other raceways. Surface nonmetallic raceways and their elbows, couplings, and similar fittings shall be designed so that the sections can be

mechanically coupled together and installed without subjecting the wires to abrasion.

Surface nonmetallic raceways and fittings are made of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. It shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low-temperature effects.

388.120 Marking. Surface nonmetallic raceways that have limited smoke-producing characteristics shall be permitted to be so identified. Each length of surface nonmetallic raceway shall be clearly and durably identified as required in the first sentence of 110.21(A).

390.17	Ampacity of Conductors

390.1 Scope. This article covers the use and installation requirements for underfloor raceways.

An underfloor raceway is a practical means of bringing light, power, and signal and communications systems to desks, work benches, or tables that are not located adjacent to wall space. This wiring method offers flexibility in layout where used with movable partitions and is commonly used in large retail stores and office buildings to supply power at any desired location.

Underfloor raceways are permitted beneath the surface of concrete, wood, or other flooring material. The wiring method between

raceway junction boxes and cabinets or outlet boxes may be any appropriate Chapter 3 wiring method.

390.2 Definition.

Underfloor Raceway. A raceway and associated components designed and intended for installation beneath or flush with the surface of a floor for the installation of cables and electrical conductors.

390.3 Use.

(A) Permitted. The installation of underfloor raceways shall be permitted beneath the surface of concrete or other flooring material or in office occupancies where laid flush with the concrete floor and covered with linoleum or equivalent floor covering.

(B) Not Permitted. Underfloor raceways shall not be installed (1) where subject to corrosive vapors or (2) in any hazardous (classified) locations, except as permitted by 504.20 and in Class I, Division 2 locations as permitted in 501.10(B)(3). Unless made of a material approved for the condition or unless corrosion protection approved for the condition is provided, metal underfloor raceways, junction boxes, and fittings shall not be installed in concrete or in areas subject to severe corrosive influences.

390.4 Covering. Raceway coverings shall comply with 390.4(A) through (D).

(A) Raceways Not over 100 mm (4 in.) Wide. Half-round and flat-top raceways not over 100 mm (4 in.) in width shall have not less than 20 mm ($\frac{3}{4}$ in.) of concrete or wood above the raceway.

Exception: As permitted in 390.4(C) and (D) for flat-top raceways.

(B) Raceways over 100 mm (4 in.) Wide But Not over 200 mm (8 in.) Wide. Flat-top raceways over 100 mm (4 in.) but not over 200 mm (8 in.) wide with a minimum of 25 mm (1 in.) spacing between raceways shall be covered with concrete to a depth of not less than 25 mm (1 in.). Raceways spaced less than 25 mm (1 in.) apart shall be covered with concrete to a depth of 38 mm (1½ in.).

As Exhibit 390.1 illustrates, flat-top underfloor raceways over 4 inches wide and spaced less than 1 inch apart must be covered with at least 1½ inches of concrete.

Approved trench-type underfloor raceways may be installed flush with the floor surface, provided they have covers that provide protection at least equal to those of junction box covers. Approved metal flat-top underfloor raceways, if not over 4 inches wide, may be installed flush with a concrete floor, provided they are equipped with covers that afford mechanical protection and rigidity equal to or exceeding that of junction box covers.

(C) Trench-Type Raceways Flush with Concrete. Trench-type flush raceways with removable covers shall be permitted to be laid flush with the floor surface. Such approved raceways shall be designed so that the cover plates provide adequate mechanical protection and rigidity equivalent to junction box covers.

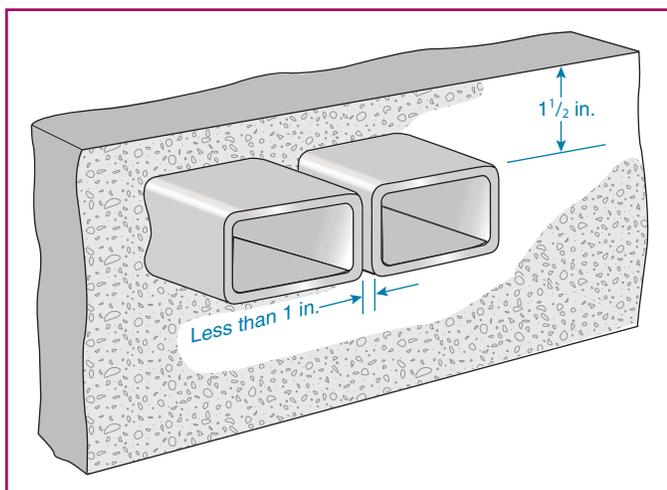

EXHIBIT 390.1 Two side-by-side underfloor raceways over 4 inches installed with the required covering. (Courtesy of Legrand/Wiremold®)

(D) Other Raceways Flush with Concrete. In office occupancies, approved metal flat-top raceways, if not over 100 mm (4 in.) in width, shall be permitted to be laid flush with the concrete floor surface, provided they are covered with substantial linoleum that is not less than 1.6 mm ($1/16$ in.) thick or with equivalent floor covering. Where more than one and not more than three single raceways are each installed flush with the concrete, they shall be contiguous with each other and joined to form a rigid assembly.

390.5 Size of Conductors. No conductor larger than that for which the raceway is designed shall be installed in underfloor raceways

390.6 Maximum Number of Conductors in Raceway. The combined cross-sectional area of all conductors or cables shall not exceed 40 percent of the interior cross-sectional area of the raceway.

390.7 Splices and Taps. Splices and taps shall be made only in junction boxes.

For the purposes of this section, so-called loop wiring (continuous, unbroken conductor connecting the individual outlets) shall not be considered to be a splice or tap.

Exception: Splices and taps shall be permitted in trench-type flush raceway having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill more than 75 percent of the raceway area at that point.

390.8 Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

390.9 Laid in Straight Lines. Underfloor raceways shall be laid so that a straight line from the center of one junction box to

the center of the next junction box coincides with the centerline of the raceway system. Raceways shall be firmly held in place to prevent disturbing this alignment during construction.

390.10 Markers at Ends. A suitable marker shall be installed at or near each end of each straight run of raceways to locate the last insert.

390.11 Dead Ends. Dead ends of raceways shall be closed.

390.13 Junction Boxes. Junction boxes shall be leveled to the floor grade and sealed to prevent the free entrance of water or concrete. Junction boxes used with metal raceways shall be metal and shall be electrically continuous with the raceways.

390.14 Inserts. Inserts shall be leveled and sealed to prevent the entrance of concrete. Inserts used with metal raceways shall be metal and shall be electrically continuous with the raceway. Inserts set in or on fiber raceways before the floor is laid shall be mechanically secured to the raceway. Inserts set in fiber raceways after the floor is laid shall be screwed into the raceway. When cutting through the raceway wall and setting inserts, chips and other dirt shall not be allowed to remain in the raceway, and tools shall be used that are designed so as to prevent the tool from entering the raceway and damaging conductors that may be in place.

390.15 Connections to Cabinets and Wall Outlets. Connections from underfloor raceways to distribution centers and wall outlets shall be made by approved fittings or by any of the wiring methods in [Chapter 3](#), where installed in accordance with the provisions of the respective articles

390.17 Ampacity of Conductors. The ampacity adjustment factors, in [310.15\(B\)\(3\)](#), shall apply to conductors installed in underfloor raceways.

Part I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

Informational Note: For further information on cable trays, see ANSI/NEMA-VE 1-2009, *Metal Cable Tray Systems*; NECA/

EXHIBIT 392.1 MC cable installed in a cable tray. (Courtesy of Legrand®)

NEMA 105-2015, *Standard for Installing Metal Cable Tray Systems*; and NEMA-FG 1-1993, *Nonmetallic Cable Tray Systems*.

Cable trays are mechanical support systems and not raceways. See the definition of *raceway* in [Article 100](#). Cable tray installations are typically an industrial-type wiring method. However, they are sometimes installed in commercial facilities as a wire-and-cable management system for telecommunications/data installations and for feeder and branch-circuit wiring. [Exhibit 392.1](#) is one example of MC cable installed in a wire mesh-type cable tray.

392.2 Definition.

Cable Tray System A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

Part II. Installation

392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.

(A) Wiring Methods. The wiring methods in [Table 392.10\(A\)](#) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Cable tray is rarely used as a major raceway support system. For raceway support systems, the versatility of strut systems exceeds that of cable tray support systems.

Metal cable trays can be used in other spaces used for environmental air (plenums) to support only the recognized wiring methods permitted in these spaces. Metal cable trays are not the limiting factor; rather, the cable or wiring method is the limiting factor.

TABLE 392.10(A) Wiring Methods

Wiring Method	Article
Armored cable: Type AC	320
CATV cables	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	725, 770, and 800
Electrical metallic tubing: Type EMT	358
Electrical nonmetallic tubing: Type ENT	362
Fire alarm cables	760
Flexible metal conduit: Type FMC	348
Flexible metallic tubing: Type FMT	360
Instrumentation tray cable: Type ITC	727
Intermediate metal conduit: Type IMC	342
Liquidtight flexible metal conduit: Type LFMC	350
Liquidtight flexible nonmetallic conduit: Type LFNC	356
Metal-clad cable: Type MC	330
Mineral-insulated, metal-sheathed cable: Type MI	332
Network-powered broadband communications cables	830
Nonmetallic-sheathed cable: Types NM, NMC, and NMS	334
Non-power-limited fire alarm cable	760
Optical fiber cables	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Power and control tray cable: Type TC	336
Power-limited fire alarm cable	760
Power-limited tray cable	725
Rigid metal conduit: Type RMC	344
Rigid polyvinyl chloride conduit: Type PVC	352
Reinforced thermosetting resin conduit: Type RTRC	355
Service-entrance cable: Types SE and USE	338
Underground feeder and branch-circuit cable: Type UF	340

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

Cable trays used to support welding cables are required by 630.42 to be dedicated for welding cable installation.

(2) Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).

(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types and raceways permitted by other articles in this Code.

(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

Fiberglass cable trays are often used to support cables in corrosive environments or in electrolytic cell rooms where voltage isolation is required.

(E) Airfield Lighting Cable Tray. In airports where maintenance and supervision conditions ensure that only qualified persons can access, install, or service the cable, airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by constant current regulators shall be permitted to be installed in cable trays.

Informational Note: Federal Aviation Administration (FAA) Advisory Circulars (ACs) provide additional practices and methods for airport lighting.

See also AC 150/5345-7F, *Specification for L-824 Underground Electrical Cable for Airport Lighting Circuits*; AC 150/5345-42H, *Specification for Airport Light Bases, Transformer Housings, Junction Boxes, and Accessories*; and AC 150/5345-26D, *FAA Specification For L-823 Plug And Receptacle, Cable Connectors*, which are available or free download from www.faa.gov.

392.12 Uses Not Permitted. Cable tray systems shall not be used in hoistways or where subject to severe physical damage.

392.18 Cable Tray Installation.

(A) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment.

Runs of cable tray are not required to be mechanically continuous from the equipment source to the equipment termination. Breaks in the mechanical continuity of cable tray systems are permitted and often occur at tees, crossovers, elevation changes, or firestops, or for thermal contraction and expansion. Also, cable tray systems are not required to be mechanically connected to the equipment they serve.

(B) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(C) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(D) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(E) Exposed and Accessible. Cable trays shall be exposed and accessible, except as permitted by 392.18(D).

(F) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(G) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article. For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

Conduit and cable termination supports as well as outlet boxes are permitted to be supported solely by the cable tray in qualifying industrial facilities only. These items are not permitted to be supported solely by the cable tray in commercial installations.

For commercial installations (and nonqualifying industrial facilities), conduit must be supported within 3 feet of the cable tray, or within 5 feet if structural members do not permit fastening within 3 feet of the cable tray. Cables connecting to equipment outside the cable tray system must be supported according to their respective article.

(H) Marking. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notice carrying the wording “DANGER — HIGH VOLTAGE — KEEP AWAY” placed in a readily visible position on all cable trays, with the spacing of warning notices not to exceed 3 m (10 ft). The danger marking(s) or labels shall comply with 110.21(B).

Exception: Where not accessible (as applied to equipment), in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, cable tray system warning notices shall be located where necessary for the installation to ensure safe maintenance and operation.

392.20 Cable and Conductor Installation.

(A) Multiconductor Cables Operating at 1000 Volts or Less. Multiconductor cables operating at 1000 volts or less shall be permitted to be installed in the same tray.

(B) Cables Operating at Over 1000 Volts. Cables operating at over 1000 volts and those operating at 1000 volts or less installed in the same cable tray shall comply with either of the following:

- (1) The cables operating at over 1000 volts are Type MC.
- (2) The cables operating at over 1000 volts are separated from the cables operating at 1000 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(C) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.10(H), the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

Binding can be accomplished with cable straps, cable ties, or other means that would avoid causing damage to the cables.

(D) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.22 Number of Conductors or Cables.

(A) Number of Multiconductor Cables Rated 2000 Volts or Less, in Cable Trays. The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes shall apply to both aluminum and copper conductors. Where dividers are used, fill calculations shall apply to each divided section of the cable tray.

(1) Ladder or Ventilating Trough Cable Trays Containing Any Mixture of Cables. Where ladder or ventilating trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.80(A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

TABLE 392.22(A) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables							
		Ladder or Ventilated Trough or Wire Mesh Cable Trays, 392.22(A)(1)				Solid Bottom Cable Trays, 392.22(A)(3)			
		Column 1 Applicable for 392.22(A)(1)(b) Only		Column 2 ^a Applicable for 392.22(A)(1)(c) Only		Column 3 Applicable for 392.22(A)(3)(b) Only		Column 4 ^a Applicable for 392.22(A)(3)(c) Only	
mm	in.	mm ²	in. ²	mm ²	in. ²	mm ²	in. ²	mm ²	in. ²
50	2.0	1,500	2.5	1,500 – (30 Sd) ^b	2.5 – (1.2 Sd) ^b	1,200	2.0	1,200 – (25 Sd) ^b	2.0 – Sd ^b

450	18.0	13,500	21.0	13,500 – (30 Sd)	21 – (1.2 Sd)	10,600	16.5	10,600 – (25 Sd)	16.5 – Sd
500	20.0	15,000	23.5	15,000 – (30 Sd)	23.5 – (1.2 Sd)	11,800	18.5	11,800 – (25 Sd)	18.5 – Sd
600	24.0	18,000	28.0	18,000 – (30 Sd)	28 – (1.2 Sd)	14,200	22.0	14,200 – (25 Sd)	22.0 – Sd
750	30.0	22,500	35.0	22,500 – (30 Sd)	35 – (1.2 Sd)	17,700	27.5	17,700 – (25 Sd)	27.5 – Sd
900	36.0	27,000	42.0	27,000 – (30 Sd)	42 – (1.2 Sd)	21,300	33.0	21,300 – (25 Sd)	33.0 – Sd

^aThe maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm² for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

^bThe term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Ladder or Ventilated Trough Cable Trays Containing Multiconductor Control and/or Signal Cables Only. Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Solid Bottom Cable Trays Containing Any Mixture of Cables. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(4) Solid Bottom Cable Tray Containing Multiconductor Control and/or Signal Cables Only. Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

TABLE 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables			
		Column 1 One Cable		Column 2 More than One Cable	
mm	in.	mm ²	in. ²	mm ²	in. ²
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(5) Ventilated Channel Cable Trays Containing Multiconductor Cables of Any Type. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of [Table 392.22\(A\)\(5\)](#).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of [Table 392.22\(A\)\(5\)](#).

(6) Solid Channel Cable Trays Containing Multiconductor Cables of Any Type. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of [Table 392.22\(A\)\(6\)](#).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of [Table 392.22\(A\)\(6\)](#).

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays. The number of single conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed

TABLE 392.22(A)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm ²	in. ²	mm ²	in. ²
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

across the cable tray. The conductor sizes shall apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of [Table 392.22\(B\)\(1\)](#) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of [Table 392.22\(B\)\(1\)](#) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.30 Securing and Supporting.

(A) Cable Trays. Cable trays shall be supported at intervals in accordance with the installation instructions.

(B) Cables and Conductors. Cables and conductors shall be secured to and supported by the cable tray system in accordance with (1), (2) and (3) as applicable:

(1) In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable runs.

TABLE 392.22(B)(1) Allowable Cable Fill Area for Single-Conductor Cables in Ladder, Ventilated Trough, or Wire Mesh Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Single-Conductor Cables in Ladder, Ventilated Trough, or Wire Mesh Cable Trays					
Inside Width of Cable Tray		Column 1		Column 2 ^a	
		Applicable for 392.22(B)(1)(b) Only		Applicable for 392.22(B)(1)(c) Only

50	2	1,400	2.0	1,400 – (28 Sd) ^b	2.0 – (1.1 Sd) ^b
100	4	2,800	4.5	2,800 – (28 Sd)	4.5 – (1.1 Sd)
150	6	4,200	6.5	4,200 – (28 Sd) ^b	6.5 – (1.1 Sd) ^b
200	8	5,600	8.5	5,600 – (28 Sd)	8.5 – (1.1 Sd)
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
400	16	11,200	17.5	11,200 – (28 Sd)	17.5 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
500	20	14,000	21.5	14,000 – (28 Sd)	21.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

^aThe maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm², for a 150-mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

^bThe term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm² (in inches, of all 1000 kcmil) and larger single-conductor cables in the same cable tray with small cables.

- (2) Supports shall be provided to prevent stress on cables where they enter raceways from cable tray systems.
- (3) The system shall provide for the support of cables and raceway wiring methods in accordance with their corresponding articles. Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between the cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

The 6-foot distance limit applies to mechanically discontinuous cable tray segments for individual conductors but not to trays containing multiconductor cables. Cables installed within cable tray systems must meet the support requirements of the applicable article that covers the cables. This requirement either limits the gap distance in cable tray runs and between the cable tray and the equipment enclosures or requires intermediate cable supports at the appropriate distances in place of the cable tray.

See also

336.10(7) for further information regarding multiconductor Type TC tray cable used with discontinuous cable tray

392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

392.56 Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.

392.60 Grounding and Bonding.

(A) Metal Cable Trays. Metal cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metal cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with **250.96** and **Part IV** of **Article 250**. Metal cable trays containing only non-power conductors shall be electrically continuous through approved connections or the use of a bonding jumper.

Informational Note: Examples of non-power conductors include nonconductive optical fiber cables and Class 2 and Class 3 Remote Control Signaling and Power Limiting Circuits.

Section 392.60(A), together with **250.96**, requires all cable tray systems that support electrical conductors (whether mechanically continuous or with isolated segments) to be electrically continuous and effectively bonded and grounded. This requirement applies whether the cable tray is used as an EGC or is used for service conductors and connected to the grounded system conductor (or the grounding electrode conductor for ungrounded systems). Where a metal cable tray contains only non-power conductors, such as fire alarm, communications, CATV, or broadband conductors, the tray must be maintained electrically continuous.

TABLE 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal ^a

100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50 ^b	258	0.40
1000	—	—	387	0.60
1200	—	—	645	1.00
1600	—	—	967.5	1.50
2000	—	—	1290	2.00 ^b

^aTotal cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

^bSteel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met

- (1) The cable tray sections and fittings are identified as an equipment grounding conductor.
- (2) The minimum cross-sectional area of cable trays conform to the requirements in [Table 392.60\(A\)](#).
- (3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.
- (4) Cable tray sections, fittings, and connected raceways are bonded in accordance with [250.96](#), using bolted mechanical connectors or bonding jumpers sized and installed in accordance with [250.102](#).

Designers of cable tray systems, for use in establishments that qualify, can specify cables without EGCs and use the cable tray system as the required EGC, provided the cable tray system meets the requirements of [392.60\(A\)](#) and (B). [Exhibit 392.2](#) illustrates an example of the grounding and bonding of multiconductor cables in cable trays with conduit runs to power equipment. Bonding jumpers connecting discontinuous sections of cable tray used as an EGC are on the load side of the overcurrent device. The equipment bonding jumper must be sized in accordance with [250.102\(D\)](#).

(C) Transitions. Where metal cable tray systems are mechanically discontinuous, as permitted in [392.18\(A\)](#), a bonding jumper sized in accordance with [250.102](#) shall connect the two sections of the cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with [250.96](#).

The bonding of the entire cable tray system is important, especially for discontinuous cable tray segments. According to [250.96\(A\)](#), properly sized and installed bonding conductors must be installed across any mechanical discontinuities in the cable tray system and across any space between the cable tray and the conductor termination equipment enclosure or its equipment ground bus.

392.80 Ampacity of Conductors.

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

Informational Note: See [110.14\(C\)](#) for conductor temperature limitations due to termination provisions.

(1) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of [392.22\(A\)](#) shall be as given in [Table 310.15\(B\)\(16\)](#) and [Table 310.15\(B\)\(18\)](#), subject to the provisions of (A)(1)(a), (b), (c), and [310.15\(A\)\(2\)](#).

(a) The adjustment factors of [310.15\(A\)\(3\)\(a\)](#) shall apply only to multiconductor cables with more than three current-carrying conductors. Adjustment factors shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of [Table 310.15\(B\)\(16\)](#) and [Table 310.15\(B\)\(18\)](#) shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with [310.15\(C\)](#).

Informational Note: See [Table B.310.15\(B\)\(2\)\(3\)](#).

The cables in [Exhibit 392.3](#), rated 2000 volts or less, are installed in a single layer in an uncovered tray, with not less than one cable diameter between cables and not more than three conductors per cable.

See also

[Table B.310.15\(B\)\(2\)\(3\)](#) in [Informative Annex B](#) for the ampacity of the conductors in this configuration

(2) Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by [310.15\(A\)\(2\)](#). The adjustment factors of [310.15\(B\)\(3\)\(a\)](#) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed),

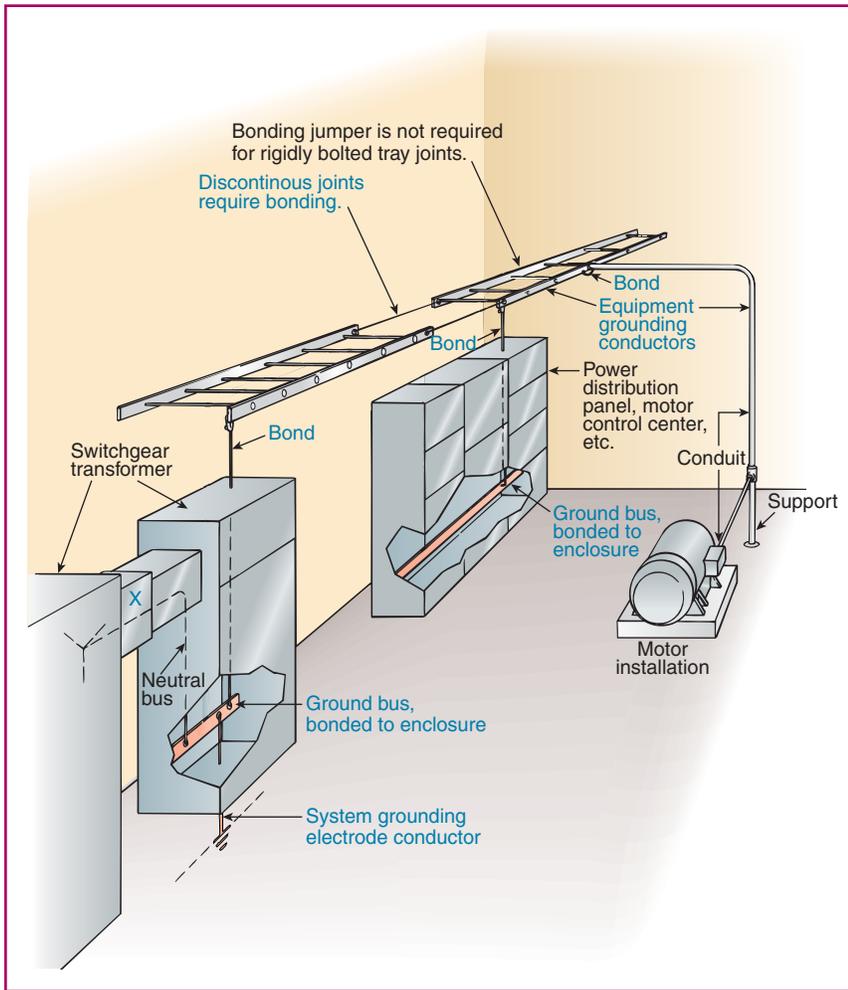

EXHIBIT 392.2 An example of multiconductor cables in cable trays with conduit runs to power equipment where bonding is provided.

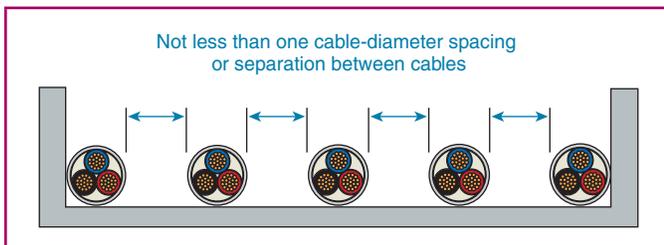

EXHIBIT 392.3 Multiconductor cables, 2000 volts or less, with not more than three conductors per cable [ampacity to be determined from Table B.310.15(B)(2)(3) in Informative Annex B].

quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19). Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed

70 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19).

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19). Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19).

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19).

Exception to (2)(3)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained

free airspace of not less than 2.15 times one conductor diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

Informational Note: See Table 310.15(B)(20).

The configuration of the conductors in the cable tray is the basis when determining the cable's ampacity. The installation must be consistent with the specifications used in the design of the cable tray system. Section 392.80(A)(2)(d) recognizes single conductors in a triangular configuration installed in a cable tray with maintained spacing as having the same ampacity as three single insulated conductors on a messenger. The maintained spacing allows air to circulate around the cable.

Where three single conductors, nominally rated 2000 volts or less, are cabled together in a triangular configuration, with not less than 2.15 times the conductor diameter ($2.15 \times \text{OD}$) between groups, as illustrated in Exhibit 392.4, the ampacity of the conductors is determined in accordance with Table 310.15(B)(20).

Where single conductors are installed in cable trays, their ampacities are permitted to be calculated using the applicable table. Where these single-conductor cables emerge from a cable tray installation and are terminated at circuit breakers, distribution switchgear, and similar electrical equipment, the temperature limitations of the electrical equipment terminals should be coordinated with the ampacity of the single-conductor cables. As stated in both the *UL Guide Information for Electrical Equipment Directory — The White Book* and in 110.14(C)(1), unless the equipment is listed and marked otherwise, conductor ampacities used in determining equipment terminations must be based on Table 310.15(B)(16) as modified by 310.15(B)() through (B)(7).

(3) Combinations of Multiconductor and Single-Conductor Cables. Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.80(A)(1) for multiconductor cables and 392.80(A)(2) for single-conductor cables, provided that the following conditions apply:

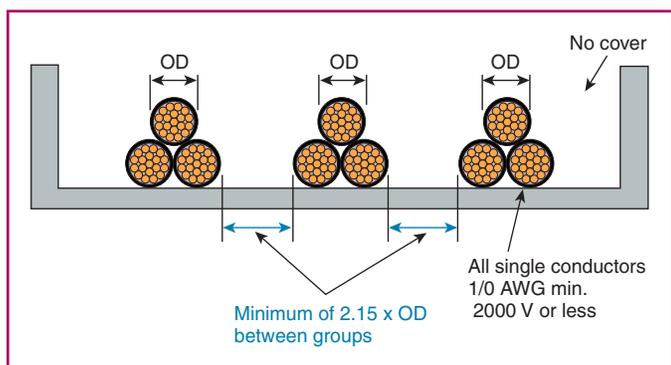

EXHIBIT 392.4 Three single conductors installed in a triangular configuration with spacing between groups of not less than 2.15 times the conductor diameter [ampacities to be determined from Table 310.15(B)(20)].

- (1) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated in accordance with 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated in accordance with 392.22(B), totals not more than 100 percent.
- (2) Multiconductor cables are installed according to 392.22(A), and single-conductor cables are installed according to 392.22(B) and 392.22(C).

Multiconductor and single-conductor cable installed in the same tray must not exceed the cable tray fill requirements for the area that each type of cable occupies.

(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.

Informational Note: See 110.40 for conductor temperature limitations due to termination provisions.

(1) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 310.60(C)(75) and Table 310.60(C)(76), subject to the following provisions:

- (1) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.60(C)(75) and Table 310.60(C)(76) shall be permitted for multiconductor cables.
- (2) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.60(C)(71) and Table 310.60(C)(72).

(2) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

- (1) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.60(C)(69) and Table 310.60(C)(70). Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.60(C)(69) and Table 310.60(C)(70).
- (2) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.60(C)(69) and Table 310.60(C)(70).

- (3) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in [Table 310.60\(C\)\(67\)](#) and [Table 310.60\(C\)\(68\)](#).

Part III. Construction Specifications

392.100 Construction.

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(B) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

(C) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by [300.6](#).

(D) Side Rails. Cable trays shall have side rails or equivalent structural members.

(E) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(F) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

 (A) Load Side Utilization Conductor Size
 (B) Power Feed Bus Rail Conductor Size

Part I. General

393.1 Scope. This article covers the installation of low-voltage suspended ceiling power distribution systems.

Low-voltage suspended ceiling power distribution systems are suspended ceiling assemblies that include a distribution bus within the supporting structure for the ceiling tiles. The bus distributes Class 2 power, which can be used for lighting and other applications. [Exhibit 393.1](#) illustrates a typical system. [Exhibit 393.2](#) illustrates the connection to the distribution grid bus rail.

393.2 Definitions.

Busbar. A noninsulated conductor electrically connected to the source of supply and physically supported on an insulator providing a power rail for connection to utilization equipment, such as sensors, actuators, A/V devices, low-voltage luminaire assemblies, and similar electrical equipment.

Busbar Support. An insulator that runs the length of a section of suspended ceiling bus rail that serves to support and isolate the busbars from the suspended grid rail.

Connector. A term used to refer to an electromechanical fitting.

Connector, Load. An electromechanical connector used for power from the busbar to utilization equipment.

Connector, Pendant. An electromechanical or mechanical connector used to suspend low-voltage luminaire or utilization equipment below the grid rail and to supply power to connect from the busbar to utilization equipment.

EXHIBIT 393.1 An illustration of a suspended ceiling distribution system. (Courtesy of EMerge Alliance)

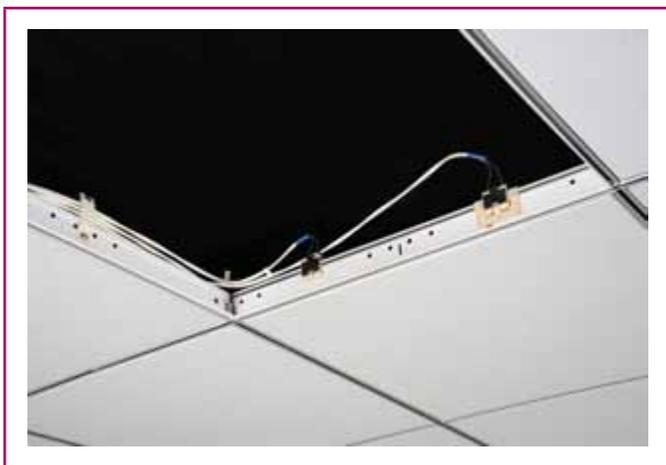

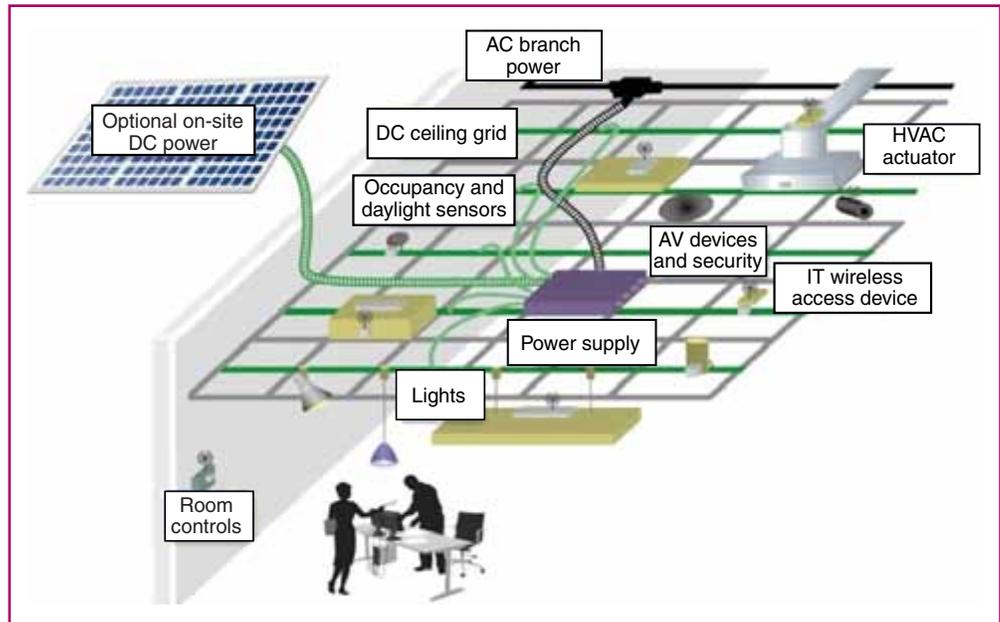

EXHIBIT 393.2 Connectors used in a suspended ceiling distribution system. (Courtesy of Armstrong® Ceiling Solutions)

Connector, Power Feed. An electromechanical connector used to connect the power supply to a power distribution cable, to connect directly to the busbar, or to connect from a power distribution cable to the busbar.

Connector, Rail to Rail. An electromechanical connector used to interconnect busbars from one ceiling grid rail to another grid rail.

Grid Bus Rail. A combination of the busbar, the busbar support, and the structural suspended ceiling grid system.

Low-Voltage Suspended Ceiling Power Distribution System. A system that serves as a support for a finished ceiling surface and consists of a busbar and busbar support system to distribute power to utilization equipment supplied by a Class 2 power supply.

Power Supply. A Class 2 power supply connected between the branch-circuit power distribution system and the busbar low-voltage suspended ceiling power distribution system.

Rail. The structural support for the suspended ceiling system typically forming the ceiling grid supporting the ceiling tile and listed utilization equipment, such as sensors, actuators, A/V devices, and low-voltage luminaires and similar electrical equipment.

Reverse Polarity Protection (Backfeed Protection). A system that prevents two interconnected power supplies, connected positive to negative, from passing current from one power source into a second power source.

Suspended Ceiling Grid. A system that serves as a support for a finished ceiling surface and other utilization equipment.

393.6 Listing Requirements. Suspended ceiling power distribution systems and associated fittings shall be listed as in 393.6(A) or (B).

(A) Listed System. Low-voltage suspended ceiling distribution systems operating at 30 volts ac or less or 60 volts dc or less shall be listed as a complete system, with the utilization equipment, power supply, and fittings as part of the same identified system.

(B) Assembly of Listed Parts. A low-voltage suspended ceiling power distribution system assembled from the following parts, listed according to the appropriate function, shall be permitted:

- (1) Listed low-voltage utilization equipment
- (2) Listed Class 2 power supply
- (3) Listed or identified fittings, including connectors and grid rails with bare conductors
- (4) Listed low-voltage cables in accordance with 725.179, conductors in raceways, or other fixed wiring methods for the secondary circuit

Part II. Installation

393.10 Uses Permitted. Low-voltage suspended ceiling power distribution systems shall be permanently connected and shall be permitted as follows:

- (1) For listed utilization equipment capable of operation at a maximum of 30 volts ac (42.4 volts peak) or 60 volts dc (24.8 volts peak for dc interrupted at a rate of 10 Hz to 200 Hz) and limited to Class 2 power levels in **Chapter 9, Table 11(A)** and **Table 11(B)** for lighting, control, and signaling circuits.
- (2) In indoor dry locations.
- (3) For residential, commercial, and industrial installations.
- (4) In other spaces used for environmental air in accordance with **300.22(C)**, electrical equipment having a metal enclosure, or with a nonmetallic enclosure and fittings, shall be listed for use within an air-handling space and shall have adequate fire-resistant and low-smoke-producing characteristics and associated wiring material suitable for the ambient temperature.

Informational Note: One method of defining adequate fire-resistant and low-smoke producing characteristics for electrical equipment with a nonmetallic enclosure is in ANSI/UL 2043-2008, *Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces*.

393.12 Uses Not Permitted. Suspended ceiling power distribution systems shall not be installed in the following:

- (1) In damp or wet locations
- (2) Where subject to corrosive fumes or vapors, such as storage battery rooms
- (3) Where subject to physical damage
- (4) In concealed locations
- (5) In hazardous (classified) locations
- (6) As part of a fire-rated floor-ceiling or roof-ceiling assembly, unless specifically listed as part of the assembly
- (7) For lighting in general or critical patient care areas

393.14 Installation.

(A) General Requirements. Support wiring shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable is not damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable.

Informational Note: Suspended ceiling low-voltage power grid distribution systems should be installed by qualified persons in accordance with the manufacturer's installation instructions.

(B) Insulated Conductors. Exposed insulated secondary circuit conductors shall be listed, of the type, and installed as described as follows:

- (1) Class 2 cable supplied by a listed Class 2 power source and installed in accordance with **Parts I and III of Article 725**
- (2) Wiring methods described in **Chapter 3**

393.21 Disconnecting Means.

(A) Location. A disconnecting means for the Class 2 supply to the power grid system shall be located so as to be accessible and within sight of the Class 2 power source for servicing or maintenance of the grid system.

(B) Multiwire Branch Circuits. Where connected to a multiwire branch circuit, the disconnecting means shall simultaneously disconnect all the supply conductors, including the grounded conductors.

393.30 Securing and Supporting.

(A) Attached to Building Structure. A suspended ceiling low-voltage power distribution system shall be secured to the mounting surface of the building structure by hanging wires, screws, or bolts in accordance with the installation and operation instructions. Mounting hardware, such as screws or bolts, shall be either packaged with the suspended ceiling low-voltage lighting power distribution system, or the installation instructions shall specify the types of mounting fasteners to be used.

(B) Attachment of Power Grid Rails. The individual power grid rails shall be mechanically secured to the overall ceiling grid assembly.

393.40 Connectors and Enclosures.

(A) Connectors. Connections to busbar grid rails, cables, and conductors shall be made with listed insulating devices, and these connections shall be accessible after installation. A soldered connection shall be made mechanically secure before being soldered. Other means of securing leads, such as push-on terminals and spade-type connectors, shall provide a secure mechanical connection. The following connectors shall be permitted to be used as connection or interconnection devices:

- (1) Load connectors shall be used for power from the busbar to listed utilization equipment.
- (2) A pendant connector shall be permitted to suspend low-voltage luminaires or utilization equipment below the grid rail and to supply power from the busbar to the utilization equipment.
- (3) A power feed connector shall be permitted to connect the power supply directly to a power distribution cable and to the busbar.
- (4) Rail-to-rail connectors shall be permitted to interconnect busbars from one ceiling grid rail to another grid rail.

Informational Note: For quick-connect terminals, see UL 310, *Standard for Electrical Quick-Connect*, and for mechanical splicing devices, see UL 486A, *Standard for Wire Connectors and Soldering Lugs for Use with Copper Conductors*, and 486B, *Standard for Wire Connectors*.

(B) Enclosures. Where made in a wall, connections shall be installed in an enclosure in accordance with **Parts I, II, and III of Article 314**.

393.45 Overcurrent and Reverse Polarity (Backfeed) Protection.

(A) Overcurrent Protection. The listed Class 2 power supply or transformer primary shall be protected at not greater than 20 amperes.

(B) Interconnection of Power Sources. Listed Class 2 sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection.

(C) Reverse Polarity (Backfeed) Protection of Direct-Current Systems. A suspended ceiling low-voltage power distribution system shall be permitted to have reverse polarity (backfeed) protection of dc circuits by one of the following means:

- (1) If the power supply is provided as part of the system, the power supply is provided with reverse polarity (backfeed) protection; or
- (2) If the power supply is not provided as part of the system, reverse polarity or backfeed protection can be provided as part of the grid rail busbar or as a part of the power feed connector.

393.56 Splices. A busbar splice shall be provided with insulation and mechanical protection equivalent to that of the grid rail busbars involved.

393.57 Connections. Connections in busbar grid rails, cables, and conductors shall be made with listed insulating devices and be accessible after installation. Where made in a wall, connections shall be installed in an enclosure in accordance with **Parts I, II, and III** of **Article 314**, as applicable.

393.60 Grounding.

(A) Grounding of Supply Side of Class 2 Power Source. The supply side of the Class 2 power source shall be connected to an equipment grounding conductor in accordance with the applicable requirements in **Part IV** of **Article 250**.

(B) Grounding of Load Side of Class 2 Power Source. Class 2 load side circuits for suspended ceiling low-voltage power grid distribution systems shall not be grounded.

Part III. Construction Specifications

393.104 Sizes and Types of Conductors.

(A) Load Side Utilization Conductor Size. Current-carrying conductors for load side utilization equipment shall be copper and shall be 18 AWG minimum.

Exception: Conductors of a size smaller than 18 AWG, but not smaller than 24 AWG, shall be permitted to be used for Class 2 circuits. Where used, these conductors shall be installed using a **Chapter 3** wiring method, shall be totally enclosed, shall not

be subject to movement or strain, and shall comply with the ampacity requirements in **Table 522.22**.

(B) Power Feed Bus Rail Conductor Size. The power feed bus rail shall be 16 AWG minimum or equivalent. For a busbar with a circular cross section, the diameter shall be 1.29 mm (0.051 in.) minimum, and, for other than circular busbars, the area shall be 1.32 mm² (0.002 in.²) minimum.

Part III. Construction Specifications

- 394.104 Conductors

Part I. General

394.1 Scope. This article covers the use, installation, and construction specifications of concealed knob-and-tube wiring.

394.2 Definition.

Concealed Knob-and-Tube Wiring. A wiring method using knobs, tubes, and flexible nonmetallic tubing for the protection and support of single insulated conductors.

Knob-and-tube wiring is allowed to be concealed, while open wiring on insulators (**Article 398**) is required to be exposed. Concealed knob-and-tube wiring is designed for use in hollow spaces of walls, ceilings, and attics and utilizes the free air in such spaces for heat dissipation.

Part II. Installation

394.10 Uses Permitted. Concealed knob-and-tube wiring shall be permitted to be installed in the hollow spaces of walls and ceilings, or in unfinished attics and roof spaces as provided by 394.23, only as follows:

- (1) For extensions of existing installations
- (2) Elsewhere by special permission

Concealed knob-and-tube wiring is permitted to be installed only for extensions of existing installations or where special permission is granted by the AHJ. See the definition of *special permission* in Article 100.

394.12 Uses Not Permitted. Concealed knob-and-tube wiring shall not be used in the following:

- (1) Commercial garages
- (2) Theaters and similar locations
- (3) Motion picture studios
- (4) Hazardous (classified) locations
- (5) Hollow spaces of walls, ceilings, and attics where such spaces are insulated by loose, rolled, or foamed-in-place insulating material that envelops the conductors

Blown-in, foamed-in, or rolled insulation prevents the dissipation of heat into the free air space, resulting in higher conductor temperature, which could cause insulation breakdown and possible insulation ignition. This section prohibits installation of knob-and-tube wiring in hollow spaces that have been weatherized.

394.17 Through or Parallel to Framing Members. Conductors shall comply with 398.17 where passing through holes in structural members. Where passing through wood cross members in plastered partitions, conductors shall be protected by noncombustible, nonabsorbent, insulating tubes extending not less than 75 mm (3 in.) beyond the wood member.

394.19 Clearances.

(A) General. A clearance of not less than 75 mm (3 in.) shall be maintained between conductors and a clearance of not less than 25 mm (1 in.) between the conductor and the surface over which it passes.

(B) Limited Conductor Space. Where space is too limited to provide these minimum clearances, such as at meters, panelboards, outlets, and switch points, the individual conductors shall be enclosed in flexible nonmetallic tubing, which shall be continuous in length between the last support and the enclosure or terminal point.

(C) Clearance from Piping, Exposed Conductors, and So Forth. Conductors shall comply with 398.19 for clearances from other exposed conductors, piping, and so forth.

394.23 In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with 394.23(A) or (B).

Informational Note: See 310.15(A)(3) for temperature limitation of conductors.

(A) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2.1 m (7 ft) above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm (1 in.) on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required where conductors are installed along the sides of joists, studs, or rafters.

(B) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 900 mm (3 ft), the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

394.30 Securing and Supporting.

(A) Supporting. Conductors shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed as follows:

- (1) Within 150 mm (6 in.) of each side of each tap or splice, and
- (2) At intervals not exceeding 1.4 m (4½ ft).

Where it is impracticable to provide supports, conductors shall be permitted to be fished through hollow spaces in dry locations, provided each conductor is individually enclosed in flexible nonmetallic tubing that is in continuous lengths between supports, between boxes, or between a support and a box.

(B) Securing. Where solid knobs are used, conductors shall be securely tied thereto by tie wires having insulation equivalent to that of the conductor.

394.42 Devices. Switches shall comply with 404.4 and 404.10(B).

394.56 Splices and Taps. Splices shall be soldered unless approved splicing devices are used. In-line or strain splices shall not be used.

Part III. Construction Specifications

394.104 Conductors. Conductors shall be of a type specified by Article 310.

Part II. Installation

- 396.10 Uses Permitted
 (A) Cable Types
 (B) In Industrial Establishments
 (C) Hazardous (Classified) Locations
396.12 Uses Not Permitted
396.30 Messenger
 (A) Support
 (B) Neutral Conductor
 (C) Equipment Grounding Conductor
396.56 Conductor Splices and Taps
396.60 Grounding

Part I. General

396.1 Scope. This article covers the use, installation, and construction specifications for messenger-supported wiring.

For many years, messenger-supported wiring systems have been used in industrial installations as well as to supply services for commercial and residential installations.

See also

225.6(A)(1) and **(B)** for references to messenger-supported wiring

396.2 Definitions.

Insulated Conductor. For the purposes of this article, an insulated conductor includes the following:

- (1) Conductor types described in **310.104**, and
- (2) Overhead service conductors encased in a polymeric material that has been evaluated for the applied nominal voltage.

Informational Note: Evidence of evaluation for the applied nominal voltage can be given by certification that the conductors have met the requirements of ICEA S-76-474-2011, *Standard for Neutral Supported Power Cable Assemblies with Weather-Resistant Extruded Insulation Rated 600 Volts*.

Messenger-Supported Wiring. An exposed wiring support system using a messenger wire to support insulated conductors by any one of the following:

- (1) A messenger with rings and saddles for conductor support
- (2) A messenger with a field-installed lashing material for conductor support
- (3) Factory-assembled aerial cable
- (4) Multiplex cables utilizing a bare conductor, factory assembled and twisted with one or more insulated conductors, such as duplex, triplex, or quadruplex type of construction

Part II. Installation**396.10 Uses Permitted.**

(A) Cable Types. The cable types in **Table 396.10(A)** shall be permitted to be installed in messenger-supported wiring under the conditions described in the article or section referenced for each.

TABLE 396.10(A) Cable Types

Cable Type	Section	Article
Medium-voltage cable		328
Metal-clad cable		330
Mineral-insulated, metal-sheathed cable		332
Multiconductor service-entrance cable		338
Multiconductor underground feeder and branch-circuit cable		340
Other factory-assembled, multiconductor control, signal, or power cables that are identified for the use		
Power and control tray cable		336
Power-limited tray cable	Table 725.154, 725.135(J), and 725.179(E)	

(B) In Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed messenger-supported wiring, the following shall be permitted:

- (1) Any of the conductor types shown in **Table 310.104(A)** or **Table 310.104(B)**
- (2) MV cable

Where exposed to weather, conductors shall be listed for use in wet locations. Where exposed to direct rays of the sun, conductors or cables shall be sunlight resistant.

Some of the triplex and quadruplex cable used by utilities as service-drop cable do not use conductors recognized in **Table 310.104(A)** and do not meet the requirements of **Article 310**.

See also

310.15(B) and **Table 310.15(B)(20)** for two or three single-insulated conductors supported on a messenger wire

310.15(C) and **Table B.310.15(B)(2)(3)** in **Informative Annex B** for ampacities of conductors for other cable types

(C) Hazardous (Classified) Locations. Messenger-supported wiring shall be permitted to be used in hazardous (classified) locations where the contained cables and messenger-supported wiring are specifically permitted by other articles in this *Code*.

396.12 Uses Not Permitted. Messenger-supported wiring shall not be used in hoistways or where subject to physical damage.

396.30 Messenger.

(A) **Support.** The messenger shall be supported at dead ends and at intermediate locations so as to eliminate tension on the conductors. The conductors shall not be permitted to come into contact with the messenger supports or any structural members, walls, or pipes.

(B) **Neutral Conductor.** Where the messenger is used as a neutral conductor, it shall comply with the requirements of 225.4, 250.184(A), 250.184(B)(7), and 250.187(B).

(C) **Equipment Grounding Conductor.** Where the messenger is used as an equipment grounding conductor, it shall comply with the requirements of 250.32(B), 250.118, 250.184(B)(8), and 250.187(D).

396.56 Conductor Splices and Taps. Conductor splices and taps made and insulated by approved methods shall be permitted in messenger-supported wiring.

396.60 Grounding. The messenger shall be grounded as required by 250.80 and 250.86 for enclosure grounding.

Part III. Construction Specifications

- 398.104 Conductors

Part I. General

398.1 Scope. This article covers the use, installation, and construction specifications of open wiring on insulators.

398.2 Definition.

Open Wiring on Insulators. An exposed wiring method using cleats, knobs, tubes, and flexible tubing for the protection and support of single insulated conductors run in or on buildings.

Part II. Installation

398.10 Uses Permitted. Open wiring on insulators shall be permitted only for industrial or agricultural establishments on systems of 1000 volts, nominal, or less, as follows:

- (1) Indoors or outdoors
- (2) In wet or dry locations
- (3) Where subject to corrosive vapors
- (4) For services

Open wiring on insulators is an exposed wiring method that is not permitted to be concealed by the building structure or finish. It is permitted indoors or outdoors, in dry or wet locations, and where subject to corrosive vapors, provided the insulation choice from Table 310.104(A) is suitable for use in a corrosive environment.

This wiring method is not permitted for temporary lighting and power circuits on construction sites but is permitted for lighting and power circuits in agricultural buildings [see 547.5(A)]. It may also be used for services (see 230.43).

See also

Tables 310.15(B)(17) and 310.15(B)(19) for ampacities of conductors

398.12 Uses Not Permitted. Open wiring on insulators shall not be installed where concealed by the building structure.

398.15 Exposed Work.

(A) **Dry Locations.** In dry locations, where not exposed to physical damage, conductors shall be permitted to be separately enclosed in flexible nonmetallic tubing. The tubing shall be in continuous lengths not exceeding 4.5 m (15 ft) and secured to the surface by straps at intervals not exceeding 1.4 m (4½ ft).

(B) **Entering Spaces Subject to Dampness, Wetness, or Corrosive Vapors.** Conductors entering or leaving locations subject to dampness, wetness, or corrosive vapors shall have drip loops formed on them and shall then pass upward and inward from the outside of the buildings, or from the damp, wet, or corrosive location, through noncombustible, nonabsorbent insulating tubes.

Informational Note: See 230.52 for individual conductors entering buildings or other structures.

(C) **Exposed to Physical Damage.** Conductors within 2.1 m (7 ft) from the floor shall be considered exposed to physical damage. Where open conductors cross ceiling joists and wall studs

and are exposed to physical damage, they shall be protected by one of the following methods:

- (1) Guard strips not less than 25 mm (1 in.) nominal in thickness and at least as high as the insulating supports, placed on each side of and close to the wiring.
- (2) A substantial running board at least 13 mm (½ in.) thick in back of the conductors with side protections. Running boards shall extend at least 25 mm (1 in.) outside the conductors, but not more than 50 mm (2 in.), and the protecting sides shall be at least 50 mm (2 in.) high and at least 25 mm (1 in.), nominal, in thickness.
- (3) Boxing made in accordance with 398.15(C)(1) or (C)(2) and furnished with a cover kept at least 25 mm (1 in.) away from the conductors within. Where protecting vertical conductors on side walls, the boxing shall be closed at the top and the holes through which the conductors pass shall be bushed.
- (4) Rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing. When installed in metal piping, the conductors shall be encased in continuous lengths of approved flexible tubing.

398.17 Through or Parallel to Framing Members. Open conductors shall be separated from contact with walls, floors, wood cross members, or partitions through which they pass by tubes or bushings of noncombustible, nonabsorbent insulating material. Where the bushing is shorter than the hole, a waterproof sleeve of noninductive material shall be inserted in the hole and an insulating bushing slipped into the sleeve at each end in such a manner as to keep the conductors absolutely out of contact with the sleeve. Each conductor shall be carried through a separate tube or sleeve.

Informational Note: See 310.15(A)(3) for temperature limitation of conductors.

398.19 Clearances. Open conductors shall be separated at least 50 mm (2 in.) from metal raceways, piping, or other conducting material, and from any exposed lighting, power, or signaling conductor, or shall be separated therefrom by a continuous and firmly fixed nonconductor in addition to the insulation of the conductor. Where any insulating tube is used, it shall be secured at the ends. Where practicable, conductors shall pass over rather than under any piping subject to leakage or accumulations of moisture.

The requirement for additional protective insulation on open wiring is to prevent contact with metal piping, metal objects, or exposed conductors of other circuits.

398.23 In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with 398.23(A) or (B).

(A) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes

in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2.1 m (7 ft) above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm (1 in.) on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required for conductors installed along the sides of joists, studs, or rafters.

(B) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, in attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 900 mm (3 ft), the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

398.30 Securing and Supporting.

(A) Conductor Sizes Smaller Than 8 AWG. Conductors smaller than 8 AWG shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed as follows:

- (1) Within 150 mm (6 in.) from a tap or splice
- (2) Within 300 mm (12 in.) of a dead-end connection to a lampholder or receptacle
- (3) At intervals not exceeding 1.4 m (4½ ft) and at closer intervals sufficient to provide adequate support where likely to be disturbed

(B) Conductor Sizes 8 AWG and Larger. Supports for conductors 8 AWG or larger installed across open spaces shall be permitted up to 4.5 m (15 ft) apart if noncombustible, nonabsorbent insulating spacers are used at least every 1.4 m (4½ ft) to maintain at least 65 mm (2½ in.) between conductors.

Where not likely to be disturbed in buildings of mill construction, 8 AWG and larger conductors shall be permitted to be run across open spaces if supported from each wood cross member on approved insulators maintaining 150 mm (6 in.) between conductors.

Mill construction is generally considered to be a building in which the floors and ceilings are supported by wood timbers or beams or wood cross members spaced approximately 15 feet apart. This type of construction is sometimes referred to as plank-on-timber construction. Conductors 8 AWG and larger are permitted to span the 15-foot distance where the ceilings are high and free of obstructions and the conductors are unlikely to come into contact with other objects.

(C) Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the system, conductors of sizes 250 kcmil and larger shall be permitted to be run across open spaces where supported at intervals up to 9.0 m (30 ft) apart.

The installation of open feeders on insulators mounted on the bottom of roof trusses at every bay location was once common in industrial buildings. Many bays are more than 15 feet wide. Therefore, size 250 kcmil and larger conductors are permitted to be supported at 30-foot intervals in industrial buildings where qualified persons must service the system.

In addition to the ease and economy of installation or alteration of open wiring, the close spacing of conductors reduces the reactance of a circuit and, hence, reduces the voltage drop.

(D) Mounting of Conductor Supports. Where nails are used to mount knobs, they shall not be smaller than tenpenny. Where screws are used to mount knobs, or where nails or screws are used to mount cleats, they shall be of a length sufficient to penetrate the wood to a depth equal to at least one-half the height of the knob and the full thickness of the cleat. Cushion washers shall be used with nails.

(E) Tie Wires. Conductors 8 AWG or larger and supported on solid knobs shall be securely tied thereto by tie wires having an insulation equivalent to that of the conductor.

398.42 Devices. Surface-type snap switches shall be mounted in accordance with 404.10(A), and boxes shall not be required. Other type switches shall be installed in accordance with 404.4.

Part III. Construction Specifications

398.104 Conductors. Conductors shall be of a type specified by Article 310.

399.2	Definition
399.10	Uses Permitted
399.30	Support
	(A) Conductors
	(B) Structures
	(C) Insulators

399.1 Scope. This article covers the use and installation for outdoor overhead conductors over 1000 volts, nominal.

399.2 Definition.

Outdoor Overhead Conductors. Single conductors, insulated, covered, or bare, installed outdoors on support structures in free air.

399.10 Uses Permitted. Outdoor overhead conductors over 1000 volts, nominal, shall be permitted only for systems rated over 1000 volts, nominal, as follows:

- (1) Outdoors in free air
- (2) For service conductors, feeders, or branch circuits

Informational Note: For additional information on outdoor overhead conductors over 1000 volts, see IEEE C2-2012, *National Electrical Safety Code*, and ANSI/IEEE 3001.2, *Recommended Practice for Evaluating the Electrical Service Requirements of Industrial and Commercial Power Systems*.

399.30 Support.

(A) Conductors. Documentation of the engineered design by a licensed professional engineer engaged primarily in the design of such systems for the spacing between conductors shall be available upon request of the authority having jurisdiction and shall include consideration of the following:

- (1) Applied voltage
- (2) Conductor size
- (3) Distance between support structures
- (4) Type of structure
- (5) Wind/ice loading
- (6) Surge protection

(B) Structures. Structures of wood, metal, concrete, or combinations of those materials, shall be provided for support of overhead conductors over 1000 volts, nominal. Documentation of the engineered design by a licensed professional engineer engaged primarily in the design of such systems and the installation of each support structure shall be available upon request of the authority having jurisdiction and shall include consideration of the following:

- (1) Soil conditions
- (2) Foundations and structure settings
- (3) Weight of all supported conductors and equipment
- (4) Weather loading and other conditions such as, but not limited to, ice, wind, temperature, and lightning
- (5) Angle where change of direction occurs
- (6) Spans between adjacent structures
- (7) Effect of dead-end structures
- (8) Strength of guys and guy anchors
- (9) Structure size and material(s)
- (10) Hardware

(C) Insulators. Insulators used to support conductors shall be rated for all of the following:

- (1) Applied phase-to-phase voltage
- (2) Mechanical strength required for each individual installation
- (3) Impulse withstand BIL in accordance with Table 490.24

Informational Note: 399.30(A), (B), and (C) are not all-inclusive lists.

Part I. General

400.1 Scope. This article covers general requirements, applications, and construction specifications for flexible cords and flexible cables.

Flexible cords and flexible cables, because of the nature of their use, are not considered to be wiring methods, which are covered in [Chapter 3](#). A review of [400.10](#), Uses Permitted, and [400.12](#), Uses Not Permitted, is necessary before choosing flexible cords or flexible cables for a specific application. The flexible cords and flexible cables referred to in [Article 400](#) are not limited to use with portable equipment.

Informational Note: UL 817, *Cord Sets and Power-Supply Cords*, allows the use of flexible cords manufactured in accordance with UL 62, *Flexible Cords and Cables*. See [400.10](#) and [400.12](#) for flexible cords that are part of a listed cord set or power-supply cord.

400.2 Other Articles. Flexible cords and flexible cables shall comply with this article and with the applicable provisions of other articles of this *Code*.

400.3 Suitability. Flexible cords and flexible cables and their associated fittings shall be suitable for the conditions of use and location.

400.4 Types. Flexible cords and flexible cables shall conform to the description in Table 400.4. The use of flexible cords and flexible cables other than those in Table 400.4 shall require permission by the authority having jurisdiction.

TABLE 400.4 Flexible Cords and Flexible Cables

Trade Name	Type Letter	Voltage	AWG or kcmil	Number of Conductors	Insulation	AWG or kcmil	Nominal Insulation Thickness		Braid on Each Conductor	Outer Covering	Use

Notes:

All types listed in Table 400.4 shall have individual conductors twisted together, except for Types HPN, SP-1, SP-2, SP-3, SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, SPT-1W, SPT-2W, TPT, NISP-1, NISP-2, NISPT-1, NISPT-2, NISPE-1, NISPE-2, and three-conductor parallel versions of SRD, SRDE, and SRDT.

The individual conductors of all cords, except those of heat-resistant cords, shall have a thermoset or thermoplastic insulation, except that the equipment grounding conductor, where used, shall be in accordance with 400.23(B).

¹Rubber-filled or varnished cambric tapes shall be permitted as a substitute for the inner braids.

²Elevator traveling cables for operating control and signal circuits shall contain nonmetallic fillers as necessary to maintain concentricity. Cables shall have steel supporting members as required for suspension by 620.41. In locations subject to excessive moisture or corrosive vapors or gases, supporting members of other materials shall be permitted. Where steel supporting members are used, they shall run straight through the center of the cable assembly and shall not be cabled with the copper strands of any conductor.

In addition to conductors used for control and signaling circuits, Types E, EO, ETP, and ETT elevator cables shall be permitted to incorporate in the construction one or more 20 AWG telephone conductor pairs, one or more coaxial cables, or one or more optical fibers. The 20 AWG conductor pairs shall be permitted to be covered with suitable shielding for telephone, audio, or higher frequency communications circuits; the coaxial cables shall consist of a center conductor, insulation, and a shield for use in video or other radio frequency communications circuits. The optical fiber shall be suitably covered with flame-retardant thermoplastic. The insulation of the conductors shall be rubber or thermoplastic of a thickness not less than specified for the other conductors of the particular type of cable. Metallic shields shall have their own protective covering. Where used, these components shall be permitted to be incorporated in any layer of the cable assembly but shall not run straight through the center.

³Insulations and outer coverings that meet the requirements as flame retardant, limited smoke, and are so listed, shall be permitted to be marked for limited smoke after the Code type designation.

⁴Elevator cables in sizes 20 AWG through 14 AWG are rated 300 volts, and sizes 10 AWG through 2 AWG are rated 600 volts. 12 AWG is rated 300 volts with a 0.76 mm (30 mil) insulation thickness and 600 volts with a 1.14 mm (45 mil) insulation thickness.

⁵Conductor size for Types EV, EVJ, EVE, EVJE, EVT, and EVJT cables apply to nonpower-limited circuits only. Conductors of power-limited (data, signal, or communications) circuits may extend beyond the stated AWG size range. All conductors shall be insulated for the same cable voltage rating.

⁶Insulation thickness for Types EV, EVJ, EVEJE, EVT, and EVJT cables of nylon construction is indicated in parentheses.

⁷Types G, G-GC, S, SC, SCE, SCT, SE, SEO, SEOO, SEW, SEOW, SEOOOW, SO, SOO, SOW, SOOW, ST, STO, STOO, STW, STOW, STOOOW, PPE, and W shall be permitted for use on theater stages, in garages, and elsewhere where flexible cords are permitted by this Code.

⁸The third conductor in Type HPN shall be used as an equipment grounding conductor only. The insulation of the equipment grounding conductor for Types SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, NISPT-1, NISPT-2, NISPE-1, and NISPE-2 shall be permitted to be thermoset polymer.

⁹Cords that comply with the requirements for outdoor cords and are so listed shall be permitted to be designated as weather and water resistant with the suffix “W” after the Code type designation. Cords with the “W” suffix are suitable for use in wet locations and are sunlight resistant.

¹⁰The required outer covering on some single-conductor cables may be integral with the insulation.

¹¹Types TPT and TST shall be permitted in lengths not exceeding 2.5 m (8 ft) where attached directly, or by means of a special type of plug, to a portable appliance rated at 50 watts or less and of such nature that extreme flexibility of the cord is essential.

400.5 Ampacities for Flexible Cords and Flexible Cables.

(A) **Ampacity Tables.** Table 400.5(A)(1) provides the allowable ampacities, and Table 400.5(A)(2) provides the ampacities for flexible cords and flexible cables with not more than three current-carrying conductors. These tables shall be used in conjunction with applicable end-use product standards to ensure selection of the proper size and type. Where cords and cables are used in ambient temperatures other than 30°C (86°F), the temperature correction factors from Table 310.15(B)(2)(a) that correspond to the temperature rating of the cord or cable shall be applied to the ampacity in Table 400.5(A)(1) and Table 400.5(A)(2). Cords and cables rated 105°C shall use correction factors in the 90°C column of Table 310.15(B)(2)(a) for temperature correction. Where the number of current-carrying conductors exceeds

three, the allowable ampacity or the ampacity of each conductor shall be reduced from the three-conductor rating as shown in Table 400.5(A)(3).

Informational Note: See Informative Annex B, Table B.310.15(B)(2)(11), for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

Where flexible power cables are used in an ambient temperature exceeding 30°C (86°F), “correction factors” are required to be applied to the ampacities in Table 400.5(A)(2). This parallels the Article 310 requirements for ampacity correction of conductors used in elevated ambient temperatures. In fact, the ambient correction factors that are to be used for power cables are those specified in Table 310.15(B)(16). The specific correction factor to be applied is predicated on the temperature rating of the power cable.

TABLE 400.5(A)(1) Allowable Ampacity for Flexible Cords and Flexible Cables [Based on Ambient Temperature of 30°C (86°F). See 400.13 and Table 400.4.]

^aThe allowable currents under Column A apply to three-conductor cords and other multiconductor cords connected to utilization equipment so that only three-conductors are current-carrying.

^bThe allowable currents under Column B apply to two-conductor cords and other multiconductor cords connected to utilization equipment so that only two conductors are current-carrying.

^cTinsel cord.

^dElevator cables only.

^e7 amperes for elevator cables only; 2 amperes for other types.

¹The ampacities under subheading D shall be permitted for single-conductor Types SC, SCE, SCT, PPE, and W cable only where the individual conductors are not installed in raceways and are not in physical contact with each other except in lengths not to exceed 600 mm (24 in.) where passing through the wall of an enclosure

²The ampacities under subheading E apply to two-conductor cables and other multiconductor cables connected to utilization equipment so that only two conductors are current-carrying.

³The ampacities under subheading F apply to three-conductor cables and other multiconductor cables connected to utilization equipment so that only three conductors are current-carrying.

TABLE 400.5(A)(3) Adjustment Factors for More than Three
 Current-Carrying Conductors in a Flexible Cord or Flexible Cable

Number of Conductors	Percent of Value in Table 400.5(A)(1) and Table 400.5(A)(2)
4–6	80
7–9	70
10–20	50
21–30	45
31–40	40
41 and above	35

A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to meet the requirements of a current-carrying conductor.

In a 3-wire circuit consisting of two phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system,

a common conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.

On a 4-wire, 3-phase, wye circuit where more than 50 percent of the load consists of nonlinear loads, there are harmonic currents present in the neutral conductor and the neutral conductor shall be considered to be a current-carrying conductor.

An equipment grounding conductor shall not be considered a current-carrying conductor.

Where a single conductor is used for both equipment grounding and to carry unbalanced current from other conductors, as provided for in 250.140 for electric ranges and electric clothes dryers, it shall not be considered as a current-carrying conductor.

(B) Ultimate Insulation Temperature. In no case shall conductors be associated together in such a way with respect to the kind of circuit, the wiring method used, or the number of conductors such that the limiting temperature of the conductors is exceeded.

(C) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated in accordance with 310.15(C).

The ampacity of flexible cords and flexible cables may be determined in accordance with the Neher–McGrath formula found in 310.15(C).

400.6 Markings.
