URBAN WASTEWATER – WASTE STANDARD

(This translation is for reference only)

HA NOI - 1996

Urban waste water – Waste standard

1. Scope

- 1.1 This standard specifies the critical value of parameters and content of substances in urban wastewater composition.
- 1.2 This standard is used to control the wastewater quality before being discharged into waster sectors which planned as raw water used for water treatment works to serve eating and living (Called the A type source) and common drainage system of the city (called the B type source).
- 1.3 This standard does not apply to other areas, for example: aquaculture sector, transportation, agriculture, tourism services ...

2. Limit value

- 2.1 Limit values of parameters and content of substances in urban wastewater composition discharged into A and B type source must be consistent with the regulations in Table 1.
- 2.2 The parameter values and component concentrations in the urban waste water equal to or less than the value specified in column A may be discharged into water sector used for domestic water supply.
- 2.3 The parameter values and component concentrations in the urban waste water equal to or less than the value specified in column B may be discharged into common drainage system of the city
- 2.4 The parameter values and component concentrations in the urban wastewater more than the value specified in column B, it is necessary to treat before being discharged into the environment.
- 2.5 The other parameters in Table 1 are taken from TCVN 5945: 1995
- 2.6 Sampling methods, analysis, calculation, and determining each parameter and specific concentration specified in the respective Vietnam national standard.
